Marcion, according to Theodoret, maintained the existence of four principles, or unbegotten substances, as his expression is: one the good God, and unknown, whom he also calls the father of our Lord Jesus Christ; and the Creator, called by him just, and sometimes evil; and, besides these, Matter, and the evil one that governs it. Some, as Epiphanius and Cyril of Jerusalem, ascribe to Marcion and his followers the doctrine of three principles; Augustine says, that he held two principles; and Tertullian often asserts, that Marcion believed two gods, though not both equal. Dr. Lardner apprehends, that Marcion believed in only two eternals; the Supreme God the Father, who was good, and Matter; for, according to him, the Creator was from the Father; and the Devil, somehow or other, sprang out of Matter, which he thought to be eternal. After the example of the oriental doctors, says Mosheim, the Marcionites held the existence of two principles; the one perfectly good, and the other perfectly evil: between these they imagined an intermediate kind of deity of a mixed nature, who was the creator of this inferior world, and the god and legislator of the Jewish nation, who wages perpetual war with the evil principle; and both the one and the other aspire to the place of the Supreme Being, and ambitiously attempt to subject to their authority all the inhabitants of the world. The Jews are the subjects of that powerful genius who formed this globe: the other nations, who worshipped a variety of gods, were supposed to be under the empire of the evil principle. These two conflicting powers exercise oppressions upon rational and immortal souls; and, therefore, the supreme God the Father, who had also a world of his own making, but better than this, immaterial and invisible, in order to deliver them from bondage, sent to the Jews a being most like unto himself, even his son Jesus Christ, clothed with a certain shadowy resemblance of body, that he might be visible to mortal eyes; whose commission was to destroy the empire of the evil principle, and of the author of this world, and to bring back wandering souls to

God. This celestial messenger was attacked by the prince of darkness, and by the god of the Jews, but without effect; since, having a body only in appearance, he was thereby rendered incapable of suffering. Those who follow the directions of this celestial conductor, mortify the body by fastings and austerities, and renounce the precepts of the god of the Jews, and of the prince of darkness, shall, after death, ascend to the mansions of felicity and perfection. The rule of manners which Marcion prescribed to his followers was excessively austere, containing an express prohibition of wedlock, wine, flesh, and all the external comforts of life. See MANICHEANS.

Marcion denied the real birth, incarnation, and passion of Jesus Christ, and held them to be all apparent only. He denied the resurrection of the body; and allowed none to be baptized but those who preserved their continence; but these, he granted, might be baptized three times.

In many things, he followed the sentiments of the heretic Cerdon, and rejected the law and the prophets. He pretended the gospel had been corrupted by false prophets, and allowed none of the evangelists but St. Luke, whom also he altered in many places, as well as the Epistles of St. Paul, a great many things in which he threw out. In his own copy of St. Luke, he threw out the two first chapters entire.

Some ancient writers say, that the Marcionites held, as above stated, two gods, one good, the other evil; but, as at other times they represent them, calling one good, the other a judge, or severe: this must be their meaning. Jerom says, that Marcion taught Jesus to be the son of the good God, that is, not of the same God spoken of in the prophets, who is there represented as cruel, righteous, just, a judge, and the like. To the same purpose is the representation of Clement of Alexandria, upon whose testimony we may rely. The Marcionites say, that nature, or the world, is evil, because it is made of matter, which is evil in itself; and that the world was made by the Creator, who is just. They are, therefore, spoken of as having but low thoughts of this world on account of its being very imperfect, and not worthy of the Supreme Deity; and yet, as Tertullian says, they respected the Creator. The Marcionites seem to have been led into their erroneous notion of dividing the Deity from respect to his attributes. For they thought, if a good God had made the world, he would have excluded from it sin and misery, and that all men would have been both holy and happy. Their reasonings upon this point are given by Tertullian, as well as some other arguments, deduced from the law, and other parts of the Old Testament, to prove the being from whom that was derived, different from the supreme or good God. Although, in some instances, they seem to blame justice, denominating it severity, and representing it as inconsistent with the character of goodness in God; and for this reason feigning to themselves another God, different from the Creator, a God of unmixed goodness; yet they allowed there would be a future judgment. But then the Creator was to be the judge, whose justice they represented to be so strict as to approach near to severity. It seems also to appear from the testimony of Tertullian, and some other evidence, that the Marcionites did not allow the freedom of human actions, but were believers in a kind of necessity. They thought that the virtuous would be put into possession of eternal happiness after their departure out of this world, and that the place of their enjoyment would be where the presence of the good God was, and where Christ their saviour should also reside; but they did not allow that the body would be a partaker of this happiness, or at least they denied the resurrection of the same body; for which reason they are censured by Tertullian. According to the account given by

MARCIONITES.

Epiphanius, if we may depend upon it, Marcion taught the transmigration of souls from one body to the other; but this is contradicted by a passage in Clemens Alexandrinus, which implies that this was not the opinion of the Marcionites. According to Irenæus, Marcion taught that when Christ descended into hell, he delivered many wicked people, but left there the patriarchs, and many other good men of the Old Testament. Upon this statement Beaufobre has made many pertinent and just observations.

Marcion was so far from believing that our Saviour was born of a virgin, that he did not allow he was born at all. He thought the Son of God assumed the exterior form of a man, and appeared as a man; and that, without being born, or gradually growing up to the full stature of a man, he shewed himself at once in Galilee, as a man grown. His gospel of St. Luke, it is thought, began with these words, "In the 15th year of Tiberius, God descended into Capernaum, a city of Galilee." And the Marcionites also supposed, that at the first moment of his appearance in this world, he was completely fitted for entering on his great work, and that he immediately assumed the character of a Saviour. Although Marcion acknowledged Jesus to be Christ, he denied his being the Christ foretold by the Jewish prophets. The deliverer promised to the Jewish nation was not, as he pretended, the Son of God; nor did the oracles of the Old Testament agree to Jesus Christ. Marcion, says Tertullian, was a believer in two Christs, one who appeared in the time of Tiberius, for the salvation of all nations; and another the restorer of the Jewish state, who is yet to come. Marcion allowed the truth of our Saviour's miracles, and thought them a sufficient foundation for believing in him. His doctrine concerning our Saviour was, that, from love to the human race, and for their sake he descended into this world, and submitted to great humiliations. Although, as his followers did not acknowledge him to have had real flesh, it may be supposed that they did not allow him to have really suffered, yet they believed that he was betrayed by the Jews, at the instigation of their God the Creator, and that he died and was buried. They even said that the death of the Messiah was necessary for the salvation of man, though they did not suppose it to be an expiatory sacrifice. They must, likewise, have believed our Lord's resurrection. From various testimonies, and from the arguments alleged by Tertullian, it appears that the Marcionites believed the whole history of our Saviour's appearance in a human form, and of his death on the cross. They also believed that he was crucified between two malefactors: they moreover allowed the truth of the miraculous earthquake and darkness at the time of his crucifixion. They acknowledged his having twelve apostles, and that one of them was a traitor. They also admitted the reality of the appearance of Moses and Elias on the mount, and of that voice from heaven which said, "This is my beloved Son, hear him."

Their manners, as we have already said, were strictly virtuous. Tertullian hints, that none were admitted by them to baptism and the eucharist, the obligation of which institutions they allowed, unless they had taken an oath against having any children, as if they meant it against the Creator; and Clement supposes that they abstained from marriage, that they might not people the world of the Creator, and that they offered themselves voluntarily to martyrdom out of hatred to the Creator. On the sabbath, or seventh day, they fasted, because it had been a day of rest to the Creator, or God of the Jews, whom they despised. They permitted women to baptize, and they repeated baptism several times upon the same person, if he happened to commit any sin

after this rite had been administered to him; and at the eucharist they used only water in the cup. They had among them churches for the stated performance of public worship.

The Old Testament was altogether set aside by Marcion, under the notion that it proceeded from the Creator, who, in his estimation, was destitute of goodness, and the author of all that sin and misery which subsist in the world: and his followers agreed, that the law and the gospel could not come from the same being, because there are, in their opinion, several things contained in the former inconsistent with many in the latter. They objected to the appointment of sacrifices, and to the distinction of meats into clean and unclean; and they were displeased with the order given to the Jews, to spoil the Egyptians. Tertullian says, that they alleged such and so many objections against the law and the prophets, that they seemed more like the objections of Heathens than of persons who embraced Christianity, though ever so heretical in their notions. Their aversion to the Old Testament was so great, that on this account they mutilated many passages in the New, even in those books which they admitted; rejecting all which related to the law and the prophets, or which were quoted from them, as plainly foretelling the coming of Jesus Christ, and which spoke of his Father as the Creator of the world. Considering this Creator, or God of the Jews, as of a character very different from the good God or Father of our Lord Jesus Christ, they asserted that Christ came to destroy the law given by him, because it was opposite to the gospel.

Marcion received but eleven books of the New Testament, and those were strangely curtailed and altered. He divided them into two parts, calling the one the Gospel, and the other the Apostolicon. The former contained only one of the four gospels, *viz.* that of St. Luke, and this was mutilated and altered, and interpolated in a great variety of places. Not allowing it to be called the gospel of St. Luke, he retrenched the first and second chapters entirely, and began his gospel at the first verse of the third chapter, and this verse he read in a different manner from our copies, as we have already observed. He rejected the genealogy and baptism of our Saviour; and it, therefore, seems not unlikely that he connected that part of the first and second verses of the third chapter which he retained, with the 31st verse of the fourth chapter. He also rejected the history of the Temptation, because he would not attribute too much of human weakness to our Saviour; and the other story contained in the fourth chapter of Christ's going into the synagogue, at Nazareth, and reading out of the prophet Esaias, was also rejected. This they expunged with the whole that follows it to the end of the 30th verse. But it would be tedious to enumerate all the alterations, or omissions, or interpolations, which Marcion and his followers made in the gospel of St. Luke. They are recited from Epiphanius by Dr. Lardner. We may observe, however, that a sufficient number of passages remain even in the copies of the Marcionites, to establish the reality of the flesh and blood of Christ, and to prove that the God of the Jews was his Father, and a being of consummate goodness. Marcion rejected the Acts of the Apostles from his canon of the New Testament; his Apostolicon consisting of ten of the epistles of St. Paul. The reason why he rejected this book is very obvious, according to Tertullian, because from it we can plainly shew, that the God of the Christians, and the Creator, or God of the Jews, were the same being; and that Christ was sent by him, and by no other. The ten epistles of St. Paul, admitted by Marcion, are much altered. Those which he receives, in a very
mutilated

mutilated state, are the epistles to the Galatians, the first and second to the Corinthians, that to the Romans, the first and second to the Thessalonians, and that to the Ephesians, which he calls the epistle to the Laodiceans, and those to the Colossians, to Philemon, and to the Philippians. After all it is justly observed by Lardner, that the testimony even thus afforded in favour of the books of the New Testament is very strong. "By means of this heretic's rejecting some books entirely, and mutilating others, the ancient Christians were led to examine into the evidence for these sacred writings, and to compare copies together, and on this account to speak of whole books, and particular passages, very frequently in their works; which hath enabled us of later ages to authenticate these books, and to come at the genuine reading of many texts, in a better manner than we could otherwise have done." Lardner's Works, vol. ix. Mosheim's Eccl. Hist. vol. i.

MARCITES, **MARCITÆ**, a sect of heretics in the second century, who also called themselves the *perfecti*, and made profession of doing every thing with a great deal of liberty, and without any fear.

This doctrine they borrowed from Simon Magus, who, however, was not their chief; for they were called Marcites, from one Marcus, who conferred the priesthood, and the administration of the sacraments, on women.

MARCK, in *Geography*, a town of Prussia, in Pomerelia; 12 miles S.E. of Marienburg.

MARCKLOE, a town of Prussia, in the province of Bartenland; six miles N. of Rastenburg.

MARCKOLSHEIM, a town of France, in the department of the Lower Rhine, and chief place of a canton, in the district of Barr; 23 miles S. of Strasburg. The place contains 3996, and the canton 15,644 inhabitants, on a territory of 92½ kilometres, in 13 communes. N. lat. 48° 11'. E. long. 7° 33'.

MARC-LAJAILLE, **ST.**, a town of France, in the department of the Lower Loire, and chief place of a canton, in the district of Ancenis. The place contains 1509, and the canton 5235 inhabitants, on a territory of 160 kilometres, in seven communes.

MARCLISSA, a town of Lusatia, near the confines of Silesia; 15 miles S.E. of Gorlitz.

MARCO, **ST.**, a town of Naples, in the province of Otranto; five miles N. of Lecce.—Also, a town of Naples, in Principato Citra; 12 miles N.N.E. of Benevento.—Also, a town of Naples, in Capitanata; eight miles N. of Monte St. Angelo.—Also, a town of Naples, in Calabria Citra, the see of a bishop, eight miles W.N.W. of Bisignano.—Also, a town of Spain, in Galicia; 30 miles N.N.W. of Mondonedo.—Also, a town of New Navarre; 45 miles S.E. of Casa Grande.—Also, a town of Italy, in Friuli; nine miles W. of Udina.—Also, a town of Sicily, in the valley of Demona; 15 miles W. of Patti.—Also, a small island near the coast of Istria. N. lat. 44° 4'. E. long. 13° 53'.—Also, a river of East Florida which runs into the Atlantic, N. lat. 30° 3'. W. long. 81° 40'.

MARCOING, a town of France, in the department of the North, and chief place of a canton, in the district of Cambrai. The place contains 1175, and the canton 14,957 inhabitants, on a territory of 212½ kilometres, in 20 communes.

MARCOSIANS, or **COLARBASIANS**, an ancient sect in the church, making a branch of the Valentinians.

St. Irenæus speaks at large of the leader of this sect, Marcus, who, it seems, was reputed a great magician. Maffuet computes that Marc appeared about the year 160. Bagnæ, on the authority of Eusebius, who understood

Irenæus to say that Marc appeared about the same time with Valentinus, speaks of him at the year 127. Many learned moderns are of opinion, that Marc belonged to the Valentinian school, and they formed this opinion on the testimonies of Irenæus and Tertullian. Nevertheless Rhenford and Beaufovre say, that the Marcians were Jews, or Judaizing Christians; and Grabe likewise owns that they were of Jewish extract. Irenæus leads us to imagine that Marc, who was an Asiatic, had come into Gaul, and made many converts there. Nevertheless, learned moderns think, that they were only disciples of Marc, who came into that country where Irenæus resided, of whom, in one place, he makes particular mention. Irenæus represents him as exceedingly skilful in all magical arts, by means of which he had great success. Tertullian and Theodoret concur in calling Marc a magician. Irenæus, after giving an account of the magical arts of Marc, adds, that he had, probably, an assisting demon, by which he himself appears to prophesy, and which enabled others, especially women, to prophesy likewise; this practice favoured his seduction of many females, both in body and mind, which gained him much wealth. He is also said to have made use of philters and love-potions, in order to gain the affections of women, and his disciples are charged with doing the same. Dr. Lardner, with his usual candour and impartiality, suggests some doubts as to the justice of these accusations, with his reasons for questioning their truth.

The Marcians are said to have placed a great deal of mystery in the letters of the alphabet, and thought that they were very useful in finding out the truth. They are charged unjustly with holding two principles, and as if they were Docetæ, and denied the resurrection of the dead; for which there is no sufficient evidence. They persisted in the practice of baptism and the eucharist. As to their opinion concerning Jesus Christ, they seem to have had a notion of the great dignity and excellence of his person, or his inefable generation: and, according to them, he was born of Mary, a virgin, and the word was in him. When he came to the water, the supreme power descended upon him; and he had in him all fulness; for in him was the word, the father, truth, the church, and life. They said that the Christ, or the Spirit, came down upon the man Jesus. He made known the Father, and destroyed death, and called himself the Son of Man; for it was the good pleasure of the Father of all that he should banish ignorance and destroy death: and the acknowledgment of him is the overthrow of ignorance. From the account of Irenæus, we may infer that the Marcians believed the facts recorded in the gospels, and that they received most, or all the scriptures of the Old and New Testament. Irenæus also says, that they had an innumerable multitude of apocryphal and spurious writings, which they had forged: and that they made use of that fiction concerning the child Jesus, that when his master bade him say, alpha, the Lord did so: but when the master called him to say beta, he answered, "Do you first tell me what is alpha, and then I will tell you what beta is." As this story concerning alpha and beta is found in the gospel of the infancy of Jesus Christ, still in being, some are of opinion, that this gospel was composed by the Marcians. Lardner's Works, vol. ix.

MARCOTZI, in *Geography*, a town of Slavonia; 20 miles N.E. of Kralovavelika.

MARCOUF, **ST.**, two rocky islands in the English Channel, near the coast of France, about nine miles S.E. of La Hogue. The surface of each island, which is 18 or 20 feet above the surface of the sea at high water, comprises about an acre. They were taken possession of in

1795, by sir Sidney Smith; and, in the following year, block-houses, with detachments of marines, invalids, and 12 artillery men, were ordered out by government. In the year 1798, the French dispatched a very numerous body of troops on board 52 gun-vessels, in order to recover these islands; but after having made a vigorous attack, they were compelled to retreat to La Hogue, with the loss of 1100 killed, drowned, and wounded; but on the side of the British only one killed, and two wounded. N. lat. 49° 31'. W. long. 1° 4'.

MARCOUSSIS, a town of France, in the department of the Seine and Oise; 15 miles S. of Paris.

MARCULUS, among the Romans, a knocker, or instrument of iron to knock at the doors with.

MARCUS HOOK, in *Geography*, a place of America, in Chester county, Pennsylvania, on the W. side of Delaware river; 20 miles below Philadelphia, containing about 30 families. Here are two rows of piers, or long wharfs, for defending vessels from the driving of ice in winter.

MARCUZA, a town of Austrian Poland; 16 miles S. of Halicz.

MARD LE BLANC, ST., a town of France, in the department of the Ille and Vilaine; seven miles W. of Fougères.

MARD, St., or *St. Medard*, a town of France, in the department of the Forests; 33 miles W. of Luxemburg.

MARD *sur le Mont*, St., a town of France, in the department of the Marne; 12 miles S. of St. Menchould.

MARDS *en Othe*, a town of France, in the department of the Aube; 13 miles S.W. of Troyes.

MARDAC, in the *Materia Medica of the Ancients*, a name given by some to litharge. The Arabian writers have sometimes called it by this name, and sometimes by that of *mardefengi*. Many of their commentators have thought that they meant two different substances by these two names; but it does not appear to be truly the case, the two words standing, in different writers, for the same thing. Avicenna has given us a chapter on *mardus*, in which he has translated the chapter of Dioscorides on litharge: and Serapion has given us a chapter on the *mardefengi*, in which he has given us an account of the same substance, under the terms that Galen uses for the description of litharge, and even quotes him for the account.

MARDAITES, in *Ecclesiastical History*. See MARONITES.

MARDICK, in *Geography*, a small town, or rather village, of France, in the department of the North, situated near the coast of the English Channel; three miles S.W. of Dunkirk. This place was once famous for its canal, constructed after the peace of Utrecht, by order of Louis XIV. This canal, 3338 toises and two feet in length, commenced at the canal of Bergues, near Dunkirk, and extended with a breadth of between 25 and 30 toises, no less than 1500 toises from E. to W. in length, and then winded from S. to N., and at the distance of 300 toises farther it had a sluice with two basins in it, one of which was 44 feet broad, for the reception of large vessels, and the other 26 feet broad, for the accommodation of those that were small. It afterwards extended still farther to the main sea. Many of the works constructed in this canal were destroyed in consequence of a treaty with England in the year 1717, and no others were to be erected on that coast within six miles of Dunkirk and Mardick.

MARDJE, a town of Egypt, situated on a spot abounding with palm trees; six miles N.E. of Cairo.

MARDIKERS, or TOPASSES, a breed of Dutch, Por-

tuguese, Indians, and other natives, incorporated with the Dutch, at Batavia, probably deriving their name from Mardick, or Mardika, the subject of the above article. As the Dutch adventurers formed the leading party when Batavia was taken possession of, the natives attached the appellation to all persons of European descent or connection.

MARDIN. See MERDIN.

MARE, NICHOLAS DE LA, in *Biography*, was born about the year 1641, and was, in after life, a commissioner of the Chatelet during the space of forty years. In consideration of his great zeal in the king's service, he was made steward of the household of the count of Vermandois, and after the death of that prince, he had a pension for his life. He was employed in various important commissions relative to the revenue, and made several journeys to the provinces on public occasions, in which he acquitted himself to general satisfaction. He died in 1723, and was author of a work of high merit, entitled "Traité de la Police," 3 vols. folio, 1705—19. This contains a detailed account of the establishment of the police in France; the functions and prerogatives of its magistrates, its regulations, &c. A fourth volume was added in 1738, by M. le Clerc de Brillet. Moreri.

MARE, PHILIBERT DE LA, a literary character, and counsellor of the parliament of Dijon, who flourished in the 17th century. He was author of several works in the Latin language, taking that of De Thou as an example, which were well received by the public. The chief of these is entitled "Commentarius de Bello Burgundico apud Sequanos," containing a relation of the war of 1636. In a second edition by his son Philip, in 1689, is given a catalogue of writers on the history of Burgundy. M. Mare composed a number of biographical sketches, chiefly of literary characters, and he left in MS. Memoirs of the public transactions from the year 1673, to his death. Moreri.

MARE, in *Rural Economy*, the female of the horse kind of animal. Mares intended for the purpose of breeding, should be selected with great care and attention, so as to be as free as possible from faults or imperfections in their forms, and be well suited in their kind to the purposes for which they are designed. The practice of making use of such mares as may happen to be on the farm should never be adopted, as it is prejudicial to the raising of good horse stock. The particular directions regarding the kinds of horses to be bred, are these: if for the manege, or pads, the mares should have their heads well set on, and their breasts broad; their legs not too long, their eyes bright and sparkling, and bodies large enough, that the foal may have room to lie in their belly. They should be of a good and gentle disposition, and their motions easy and graceful: the more good qualities the mares have, the better, in general, the colts will prove.

If the owner would breed for racing, or for hunting, the mares must be chosen lighter, with short backs and long sides; their legs must be longer, and the breast not so broad; and such should always be chosen as have good blood in their veins. If the speed and wind of any particular mare have been tried, and found good, there is the more certainty of a good colt from her: but she should be in full health and vigour at the time, and not above seven years old, or eight at the utmost. The younger the breeders are, the better, in general, the colts will be.

Mares may be put to the horse when three years old, but it is a better practice to defer it a year longer, where it can be done with convenience. Some advise mares to be kept in

the house some time before they are put to the horse, but this seems of little consequence when they are in proper health.

The best season for putting mares to the horses is in the spring, about April or May, in order that the foals may be dropped sufficiently early, which is of consequence in their rearing afterwards.

The length of time that they usually go with foal is about eleven months, which is a circumstance that should be kept in the mind of the breeder, though there are often considerable deviations. Mares should always be kept well while in foal, in order to have a fine healthy offspring.

The custom of performing much work with the mares while in foal is improper, as being attended with danger, as well as liable to check the growth of the foals: when this is practised with farm mares, they should only be gently wrought, and that with great care and attention. See HORSE.

MARE, in *Geography*, a small island near the W. coast of Scotland. N. lat. $56^{\circ} 14'$. W. long. $5^{\circ} 45'$.

MAREB, a river of Africa, which rises in Abyssinia, about sixty miles N.E. of Axum, and joins the Tecazzé, in the country of Nubia, 100 miles before its junction with the Nile.

MAREB, a town of Arabia, in the province of Yemen, and capital of the district of Bellad es Scheref. Its sheriff possesses this town with some adjacent villages. The town consists of only about 300 poor houses; situated 16 leagues N.E. of Sana. It was known to the ancients by the name of "Mariaba," as the capital of the Sabæans; and in its vicinity are ruins, pretended to be the remains of the palace of queen Balkis. The Sabæans had a famous reservoir for water, called by the Arabs "Sitte Mareb," which was a narrow valley between two ranges of hills, and a day's journey in length. Six or seven small rivers meet in that valley, some of which contain fish, and their waters flow through the year; but others are dry, except in the rainy season. For confining the waters in this season, the entrance into the valley was shut up by a high and thick wall, and as outlets through which the water thus collected might be conveyed, in the time of drought, for watering the neighbouring fields, three large flood-gates were formed in the wall, one above another. The wall was 50 feet high, and built of large hewn stones. Its ruins are still visible. The tradition that the city of Mareb was destroyed by a deluge, occasioned by the sudden bursting of the wall, is fabulous. This accident, however, proved fatal to the city, by rendering the neighbouring fields waste and barren, so that it was thus left without the means of subsistence. The prince who formerly reigned over Mariaba was a powerful prince; but Mareb is now the abode of a poor sheriff, who is hardly able to withstand the encroachments of feeble neighbours. Niebuhr.

MARECA, in *Ornithology*, the name of a Brazilian species of duck, much valued there at table. It is of the shape of our duck; its head is grey, but has a beautiful red spot on each side, at the insertion of the beak, and a whiteness in the lower part under the eyes; its breast and belly are of the colour of fresh-cut oak, variegated with black spots; its legs and feet are black; its tail grey; and its wings elegantly variegated with grey and brown; but they have in the middle a large mixture of that glossy green, which we see in the necks of our drakes. There is, besides this, another species of the mareca, which is of a dusky olive-coloured brown on the back, white on the throat, and grey

on the breast and belly, and very remarkable for the fine bright red colour of its feet. See DUCK.

MARECHAL. See MARSHAL.

MARECHAUX, CAPE, in *Geography*, a cape which forms the north-east side of the bay of Jacmel in St. Domingo. N. lat. $18^{\circ} 18'$.

MARECHITES, a denomination of Indians, who inhabit the banks of the river St. John, and around Pafamaqually bay, in North America. To this class of Indians belong about 140 fighting men.

MARECKAN, one of the southern Kurile islands, in the North Pacific ocean, about 30 miles long, called by the Russians "Chimouchis." N. lat. $47^{\circ} 5'$. E. long. $152^{\circ} 50'$.

MAREGORIAN, one of the Molucca islands, about 15 miles long and 5 broad. S. lat. $0^{\circ} 36'$. E. long. $127^{\circ} 18'$.

MAREILLAC, a town of France, in the department of Aveyron, and chief place of a canton, in the district of Rodés. The place contains 1216, and the canton 10,453 inhabitants, on a territory of $252\frac{1}{2}$ kilometres, in 18 communes.

MARELLA, a town of Hindoostan, in the Carnatic; 21 miles S.S.W. of Ongole.

MAREMMES, LES, a district of the Sienna, in Etruria, divided into Maremma di qua, and Maremma di là; the former on the east, the latter on the west side of the river Ombrone; both bounded by the sea on the south. The soil is fertile, but the air is reckoned unwholesome.

MARENA, in *Ichthyology*. See SALMO *Maranzula*.

MARENGO, in *Geography*, one of the six departments into which Piedmont was divided, after it was united to the French republic, Aug. 26, 1802: it is composed of Montferrat, Alexandria, Tortoneze, and Laumelline, and is bounded on the north by a part of Italy and the department of the Sesia, on the east by Parma, on the south by Genoa, and on the west by the departments of the Tanaro and Doire. This department lies in N. lat. $44^{\circ} 50'$, and contains 181 square leagues, and 231,954 inhabitants. It is divided into five circles or districts, viz. Casal, containing 108,926 inhabitants; Alexandria, 76,081; Voghere, 67,293; Bobbio, 21,288; and Tortone, 48,366. This department, lying between the Po and the Ligurian republic, is hilly, but fertile, yielding all sorts of grain, fruits, wine, and excellent pastures. There are iron mines in the vicinity of Serravalle. This department derives its name from that of a village, four miles east of Alexandria, which was rendered famous by a severe and sanguinary battle fought there June 14th 1800, that terminated in subjecting Piedmont and Lombardy to the dominion of the French. This battle was commenced by the Austrians, who compelled the centre of the French army, though ably supported, to fall back. The Austrians advanced upon Marengo with a movement that produced dreadful carnage, and gaining fresh reinforcements, they took possession of the village; part of the centre of the French having given way, and fled in disorder from the field of battle. The right wing, thus insulated, was attacked by two lines of infantry, which marched against it with a formidable artillery; and the retreat of the centre obliged it, after vigorous resistance, to follow the same movement. Nothing could save the French army, in these desperate circumstances, but the body of reserve under general Desaix, which was not yet ready for action; Buonaparte, in order to gain time, having retarded its movement. The retreat of the French was made under the fire of 80 pieces of artillery; and though the

carnage was horrible, they kept their ranks, and instantly replaced those who fell with fresh troops.

Victory now seemed to declare in favour of the Austrians, whose numerous and excellent cavalry covered the plain, supported by several squadrons of light artillery, and threatened to turn the army. At this critical moment, the grenadiers of the consular guard marched to support the right, which was the only column that had held firm. They advanced, and like a wall of granite, as they were called at the time, sustained three successive charges. At the same instant, Monnier's division, which formed part of the corps de reserve, was ordered to attack the battalions which protected the Austrian cavalry, part of which was pursuing the centre and left of the French. On the plain of St. Juliano, the reserve under Desaix was drawn up in two lines, supported on the right and left by the artillery under Marmont, and by the cavalry under Kellerman. Behind this corps the fugitives of the centre and left formed: and the presence of Buonaparte, who flew from rank to rank, reanimated the soldiers, and at four in the afternoon, the battle which had raged for seven hours was about to recommence. The Austrians, apprehending themselves sure of victory, after having routed two-thirds of the French army and ready to surround the remainder, had not taken any account of a division that had not yet been attacked. They had therefore improvidently wasted their strength, and scattered their battalions in the ardour of pursuit. Buonaparte perceived the advantages which this ardour on the part of the enemy had given him. Desaix, at the head of his legion, rushed forward with impetuosity among the victorious battalions, charging them with the bayonet; the remainder of the division followed this movement, and the whole army, catching the enthusiasm, advanced at the pas-de-charge. The Austrians, overwhelmed with astonishment at this sudden explosion, withdrew their artillery, and the infantry began to give way. At this critical moment Desaix fell; but the loss of this brave officer, instead of disconcerting, roused the ardour of the troops into a fury, in order to avenge his death; but the bayonet, which had driven back the first line of the Austrians, could not pierce the second. The resistance of the Austrians stopping the French in their career, rendered the event of the day still doubtful; but its fate was decided by Gen. Kellerman, who, ordering a charge of cavalry, threw the Austrians into disorder, and made a whole division prisoners, to the number of 6000 men, among whom were several generals, and almost all the officers of the staff. A third line of infantry yet remained as a corps de reserve, supported by the rest of the artillery, and the whole of the cavalry. Against this last division the right wing of the French advanced with the grenadiers of the consular guard, and part of the reserve under Baudet, and supported by the artillery under the command of Marmont. The Austrian line still maintained its ground; but the French cavalry under Murat, having charged the Austrian cavalry, this latter gave way precipitately, and was completely routed; so that night scarcely put a stop to the pursuit and carnage. The French boast of having wounded, killed, and taken prisoners, 15,000 men; the victory on their part, it must be acknowledged, was signal, but their loss was probably equal to that of the army with which they contended. Many traits of heroism were exhibited on occasion of this battle, and many consequences resulted from it which will render it memorable in the page of history. Cruttwell.

MARENNE, a town of France, in the department of the Stura; 4 miles N.N.E. of Savigliano.

MARENNES, a town of France, and principal place

of a district, in the department of the Lower Charente, at the mouth of the Seudre; 9 miles S.S.W. of Rochefort. The place contains 4633, and the canton 9950 inhabitants, on a territory of 215 kilometres, in six communes. The principal article of its trade is salt. N. lat. 45° 49'. W. long. 1° 1'.

MARENZIO, LUCA, in *Biography*, an eminent and favourite Italian musical composer, who flourished during the latter end of the sixteenth century. This ingenious and fertile author, who distinguished himself chiefly as a madrigalist, was born at Concaglia, in the diocese of Brescia, and the scholar of Giovanni Contini, who was himself a voluminous composer: having, in 1565, published *Canticæ*, 6 vocum; *Introitus et Halleluja*, 5 vocum, for festivals; *Hymnos*, 4 vocum; *Threnos Hieremiæ*, 4 vocum, for Passion-week; and a *Miserere*, in four parts.

The inclination of his disciple Marenzio leading him very early to the composition of madrigals, he cultivated that style more successfully than any of his predecessors, and the number he composed is prodigious. At Venice, between the years 1587 and 1601, were printed nine books of his madrigals, for five voices; the two last were posthumous. Besides these, this author composed six books of madrigals, in six parts. Madrigals for three voices; another set for five, and still another for six voices, different from all the former. *Canzonets for the lute*. *Motetti*, a 4, & *Sacras Cantiones*, 5, 6, ac 7 *Vocibus modulandus*. All these works were first printed at Venice; and afterwards at Antwerp, and many of them in London, to English words; see "*Musica Transalpina*," two books, and a collection of Italian madrigals, with English words, published in 1589, by Thomas Watson. *Quadrio*, t. ii. p. ii. p. 324, gives a long list of his Villanelle, a 3 voci; and *Draudius*, p. 1614, of his motets, a 4, for all the festivals throughout the year. Ven. 1588. Et ejusd. *Completorium & Antiphona*, a 6, 1595.

Of the madrigal style he was called in Italy, *il piu dolce Cigno*; and the proud antagonist of Nanino, Sebastian Raval, the Spaniard, who was editor of some of his works, styles him a *divine composer*. He was some time maestro di cappella to cardinal Luigi d'Este; and, according to Adami and others, caressed and patronised by many princes and great personages, particularly the king of Poland and cardinal Cinthio Aldobrandini, nephew to pope Clement VIII. Upon his return to Rome, after quitting Poland, he was admitted into the pope's chapel, and dying in that city, 1599, he was buried in the church of St. Lorenzo, in Lucina. Adami *Offerv. per ben regolar il Coro Pontif.*

Our countryman, Peacham, in his *Complete Gentleman*, speaks of his delicious *aire* and sweet invention in madrigals; and says, "that he excelled all other whatsoever, having published more sets than any author else, and hath not an ill song." Adding, that "his first, second, and third parts of *Thyrsis*, 'Veggio dolce il mio ben, &c.' are songs the Muses themselves might not have been ashamed to have composed." To all this we can readily subscribe, and will not dispute his stature, or the colour of his hair, when he further tells us, that "he was a little black man," but where he asserts that "he was organist of the pope's chapel at Rome a good while," he loses all credence with us; as there never yet was an organ in the papal chapel; nor is it likely, however great his musical merit may have been, that the niece of any reigning pope could have been sent for to Poland, with so little ceremony, as he tells us, in the character of a lutenist and singer, in order to gratify the curiosity of

his Polish majesty, and the affection of Luca Marenzio. Indeed, the whole account favours of hear-say evidence and absurdity; and is so much the more incredible, as no other musical writers, who were eager to record every memorial they could procure concerning Luca Marenzio, have ventured to relate these circumstances.

There are no madrigals so agreeable to the ear, or amusing to the eye, as those of this ingenious and fertile composer. The subjects of fugue, imitation, and attack, are traits of elegant and pleasing melody; which, though they seem selected with the utmost care for the sake of the words they are to express, yet so artful are the texture and disposition of the parts, that the general harmony and effect of the whole are as complete and unembarrassed as if he had been writing in plain counterpoint, without poetry or contrivance.

The first set of his madrigals for five voices, however, seems the most elaborate; the fugues and imitations here are more ingenious and frequent than in his other works. He has, indeed, in those of later date more melody; but as yet there was too little to compensate for the want of contrivance. Whoever takes the trouble to score and examine this set, will discover marks of real genius with respect to harmony and modulation, with many attempts at melody of a more graceful kind than is to be found in the works of his contemporaries: as we may reasonably conclude this to have been one of his early productions, of nearly the middle of the sixteenth century.

We have never met with more than one entire movement, in *triple time*, among all the works of this excellent composer; and that is in the eighth set for five voices, "La mia Cloride brunetta." In a collection of his madrigals for six voices, published at Antwerp, 1594, some of the movements are gay and spirited, and contain passages that continued in fashion more than a hundred years after publication, as appears by the use that Purcell and Handel have made of them; and indeed there are others which modern Italians have not disdained to adopt.

The words of his ninth book of five-part madrigals are all from the Canzoniere of Petrarca, and of these the composition seems the most free and fanciful of all his works.

Though the madrigals of the sixteenth century appear now so grave as to be scarcely distinguishable from the music of the church, yet the matters of that period had very distinct and characteristic rules for composing in both styles. Pietro Pontio, who had himself produced many that were excellent, in giving instructions for composing madrigals, says, that "the subjects of fugue and imitation in them should be short, and the notes of a quicker kind, and more syncopated than in church music; otherwise they would not be madrigals." The parts likewise should frequently move together; but the greatest care should be taken to express the sense of the words as exactly as musical imitation will allow, not only by quick and slow passages, or notes ascending and descending occasionally, but by modulation, which, when the sentiment of the poet implies harshness, cruelty, pain, sorrow, or even joy, pleasure, or the like, will assist the expression more than single notes." Here he refers to the fourth madrigal of Orlando di Lasso (book i.) for an example of the happy expression of words. Though composers were now very timid in the use of flats, sharps, and transposed keys, yet licences were taken in madrigals which were inadmissible in music *à capella*. In the eighth madrigal of Luca Marenzio's ninth book, *a 5*, *Solo e pensoso*, a bold and curious composition, the upper part ascends from the key-note G to A, the ninth above by a series of fifteen semitones, and then descends

from A to D by the same intervals. The answer to subjects proposed in madrigals were more imitations than regular replies, according to the strict laws of fugue; yet, with respect to the melody of the short passages or musical sentences which were used, and the harmony with which they are accompanied, great pains seem to have been taken in polishing both. Indeed, as this was the chief music of the chamber, where it is probable the critics and lovers of music attended, for neither public concerts nor operas had as yet existence, there can be no doubt but that every refinement was bestowed on this species of composition, which the ideas of musical perfection could then suggest.

MAREOTIS, in *Geography*, a lake of Egypt, S. of Alexandria, which is become almost dry, though occasionally, as it is said, moistened by inlets from the sea. This lake, says Savary, whose banks were covered with papyrus and date-trees, is no longer in existence, because the Turks have neglected to preserve the canals which conveyed the waters of the Nile. Belon, who travelled in Egypt some years after the conquest of the Ottomans, assures us, that in his time lake Mareotis was only at half a league's distance from the walls of Alexandria, and that it was surrounded by forests of palm-trees. "At the moment of my writing, (says the same traveller,) it is entirely occupied by the sands of Lybia. These deplorable changes must be attributed to the destructive government of the Turks." See ALEXANDRIA.

MARESIGO, a town of Istria; four miles S. of Capo d'Istria.

MARETIMO, an island of the Mediterranean, near the W. coast of Sicily, about 22 miles in circumference, containing a chateau and some farms, 15 miles W. of Trapani. N. lat. 38° 4'. E. long. 12° 15'. In this island, as well as Favoyanna, both belonging to the king of Naples, he used to banish his state-prisoners.

MARETS, ROLAND DES, in *Biography*, a native of Paris, was born in 1594: he pleaded some time as an advocate at the French bar, till, disgusted with the contentions of the profession, he retired to a life of literary repose, and died in 1653. He was celebrated for an excellent skill in criticism, and for his knowledge in the Latin tongue. He wrote a number of Latin letters on literary topics, which were published after his death by M. de Launoy, under the title of "Rolandi Maresii Epistoliarum philologicarum, Lib. ii." Moreri. Bayle.

MARETS DE ST. SORLIN, JOHN DES, brother of the preceding, a man of letters of a singular character, was born at Paris in 1595. He very early distinguished himself by the liveliness of his parts, and was in great favour with cardinal Richelieu, whom he used to assist in his literary productions. In recompence for his labours he had conferred on him the posts of comptroller-general of the war extraordinaries, and secretary-general of the marine of the Levant. He was one of the first members of the French Academy, and made himself known by a variety of compositions in poetry and romance. He was likewise a writer, and his most popular piece is the comedy of "Les Visionnaires." He led a very licentious life, but in old age he became a devotee and fanatic, and was a bitter enemy of the Jansenists, whom he attacked in writings full of extravagance. He applied the prophecies in the book of Revelations to Lewis XIV., who, according to his account of the matter, was at the head of 144,000 men to destroy heresy and Mahometanism, and bring the whole world to the profession of the true faith. He died in 1676, at the age of eighty-one. Bayle.

MAREUIL, in *Geography*, a town of France, in the department

partment of the Dordogne, and chief place of a canton, in the district of Montron; 21 miles N.W. of Perigueux. The place contains 755, and the canton 9320 inhabitants, on a territory of 210 kilometres, in 18 communes.—Also, a town of France, in the department of the Vendée, and chief place of a canton, in the district of Fontenay-le-Comte; five miles N. of Luçon. The place contains 240, and the canton 4239 inhabitants, on a territory of 160 kilometres, in 17 communes.

MARGA, MARLE. See MARLE.

MARGA, *St.*, in *Geography*, a small island of Hungary, in the Danube; 10 miles S. of Buda.

MARGAB, or MARGUS, a river of Persia, which rises about 30 miles E. from Herat, and loses itself in the earth near Hamadan.

MARGAMARGA, a river of Chili, which runs into the Pacific ocean, S. lat. 33°.

MARGAMI, a town of Japan, in the island of Xicoco; 8 miles N. of Ovitfi.

MARGARET, in *Biography*, queen of Denmark, Norway, and Sweden, daughter of Waldemar III., king of Denmark, was born in 1353: she was married, while very young, to Haquin, king of Norway, and son of Magnus, king of Sweden. At her father's death, in 1375, she was a widow, and her son Olaus, then only nine years of age, was chosen king of Denmark and Norway, she being appointed the regent. In 1387, Olaus died, leaving the male line of the three northern crowns extinct. Margaret was unanimously elected to the crown of Denmark, and afterwards to that of Norway. The States urged her to enter into the matrimonial connection a second time, in order to prevent any disputes with regard to the succession of the crown, but she declined the proposal, and nominated for her successor apparent, the nearest of blood of the royal family, *viz.* Henry of Pomerania, from that time called Eric. Henry, duke of Mecklenburg, brother to Albert, king of Sweden, declared himself a competitor with Margaret, and engaged Albert in his cause. Preparations for war were made on both sides; a decisive battle was fought, in which Albert was defeated and made prisoner, and Margaret was presented with the crown of Sweden. In 1395 she was solemnly crowned queen of the three northern kingdoms. She caused Eric to be confirmed and acknowledged as her successor, procured a redemption of the crown land alienated by Albert in Sweden, and adopted a number of prudent regulations for the confirmation of her authority, and the healing of animosities. She was particularly attentive to the administration of justice in her dominions, and to the enforcement of the laws upon all ranks of her subjects. She protected and encouraged commerce, by providing for the security and good treatment of foreign merchants resorting to her ports, and employed the most vigorous means of suppressing piracy. In 1397 was concluded the famous union of Calmar, by which the three northern kingdoms were declared to be indissolubly united under one head, who should be chosen successively by each of the three, and then confirmed at an assembly of the whole, and should spend his time equally between them, applying the revenue of each to its own expenditure. Other regulations also were enacted for the maintenance of the equal rights and privileges of the three kingdoms, and the prevention of disputes. Notwithstanding, however, all the care that was taken on the subject, this treaty proved the fruitful source of wars and dissensions for several centuries. An attempt was soon after made to recover the isle of Gothland from the Teutonic knights. There were likewise disputes with the house of Holstein, which

had been suffered to gain possession of Sleswick, and these continued, with little intermission, during the remainder of the reign. Margaret, by the vigour of her administration, retained her full authority at home, and made herself respected abroad. She was less friendly to her Swedish subjects than to those of Denmark, on which account the nobles of Sweden, in a body, presented a remonstrance on the violations of their rights, to which she haughtily and imprudently replied, that "they might guard them with as much vigilance as she would keep the fortresses of the kingdom." She died in 1412, after a reign, including the regency, of thirty-six years. From the extent of her dominion, the policy of her administration, and perhaps from a suspicion of irregularity in her morals, she obtained the title of the "Semiramis of the North." That she possessed the qualities of industry, activity, steadiness, and resolution, there can be no doubt, and it is said she had a natural eloquence fitted to impress a public assembly. Univer. Hist.

MARGARET of *Anjou*, celebrated in the history of England, was the daughter of René, titular king of Sicily, Naples, and Jerusalem, descended from the count of Anjou, brother of Charles V. of France. Brought up in a court without power or rule, her natural strength of mind was not enfeebled by early indulgence, and she became distinguished as the most accomplished young princess of her time, when she was fixed upon by cardinal Beaufort and his friends as wife of Henry VI. of England. Upon her marriage she threw herself into the hands of that party which had been the means of her elevation, and to her disgrace it has been charged upon her that she was actually privy to the murder of Humphrey, duke of Gloucester. The reign of Henry VI., at this time, was disquieted by rancorous and contending factions, and in 1454, while the national discontents were rising to a crisis, Margaret was delivered of a son, and she was, almost immediately upon her recovery, called upon to exert herself in resisting the Yorkists, who had gained the victory of St. Alban's. Henry was made prisoner, but his consort was not dispirited; she raised troops, and supported the royal cause with so much spirit, that she was able to restore her husband to a nominal sovereignty, and effect a favourable compromise. In 1459, the war was renewed, when Henry fell again into the power of his enemies, and the queen, with her infant, was glad to escape first to Durham, and then into Scotland, whence returning to the north of England, she engaged the nobles and great men who lived in that part in her cause, and soon by their means collected a powerful army. With this she met the duke of York at Wakefield in the month of December 1460, and gave him a total defeat. The duke was slain, and his head, by the express command of the queen, was cut off, and placed on the gates of the city of York, being first crowned, in derision, with a paper diadem. After this she was again victorious in several actions, and in 1461 recovered the person of the king. In every instance she displayed a sanguinary and revengeful disposition towards those who fell into her hands, and against whom she bore any ill-will. The approach of Edward with a superior force obliged her again to retreat to the north, and that prince was elevated to the throne by the people of London, an event which seemed to give a fatal blow to the hopes of the house of Lancaster. In the month of March, the most bloody of all these battles was fought at Towton, in Yorkshire, in which the Lancastrians were totally defeated, and Margaret and Henry made a hasty retreat into Scotland. After this she went over to France, to seek that assistance from the French which she had in vain solicited from her nearer neighbours the Scotch. For this purpose

pose she proposed to deliver Calais to the French king on the event of Henry's being restored to the crown, and on this condition she obtained two thousand men at arms, with which she was allowed to land in Scotland. Here she was joined by others in her own interest, and proceeded to Hexham, in Northumberland, where she was met by a force under lord Montacute, who routed and totally dispersed her troops. Margaret with her son fled into a forest, where she was despoiled by a band of robbers, who stripped her of her jewels, and treated her person with great indignity. Fortunately she escaped while her plunderers were quarrelling about the booty, and penetrating into the depth of the forest, she wandered about till she was exhausted with fatigue and terror. At length, seeing a man approach with a drawn sword, she summoned resolution enough to go out to meet him, saying, "here friend, I commit to you the son of your king, for that protection which I am unable to afford him." The man, though a robber, was disarmed of every ill intention by the confidence which was reposed in him, and devoted himself to their service. After concealing them some time in the woods, and providing for their support, he conducted them in safety to the sea-coast, whence they took an opportunity of escaping into Flanders. She lived several years in retirement, while her husband continued a prisoner in the Tower of London. At length, in 1470, she was encouraged to join the earl of Warwick, who had commenced a rebellion against Edward, which ended in that change of affairs which obliged the king to quit his country, and take refuge in Flanders. Margaret, with the view of seconding his efforts, landed at Weymouth with a small body of French troops, and on that day, the 14th of April 1471, the battle fought at Barnet put an end to the life of Warwick and the hopes of the confederacy. Margaret, relying still on her good fortune, once more encountered the victorious Edward at Tewkesbury, where she suffered a total defeat, and was with her son taken prisoner; the latter was slain in cold blood by the merciless conquerors. Margaret was thrown into the Tower of London, in which her husband about that time perished; she was afterwards ransomed by Lewis XI., and retired into France, where she died in 1482. She underwent more changes of fortune, and suffered a larger portion of calamities, than can scarcely be paralleled in the history of crowned females. Her great talents and undebated spirit excited general admiration, while her sanguinary and ferocious disposition, and the preference which she was inclined at all times to give to her native country, rendered her an object of abhorrence to the greater part of the English nation. Shakspeare, whose historical plays are the echo of popular opinion, describes her in very dark colours, and as obdurate of all the tendernefs and modesty of her sex. Hum's Hist. of England.

MARGARET of Valois, queen of Navarre, sister to Francis I., king of France, was born at Angoulême in the year 1492. She married the duke of Alençon in 1509, and became a widow in 1525. When her brother was prisoner in Spain, and extremely ill through the treatment to which he was exposed, she paid him a visit, and restored him to health by her kind offices, in return for which he promoted her marriage with Henry d'Albret, king of Navarre, upon very advantageous conditions. As soon as she was seated on the throne of this small kingdom, she united with her husband in every effort to make it flourish, by encouraging agriculture and the useful arts, improving the administration of justice, and promoting knowledge and civilization. She was herself of an inquisitive turn of mind, and in contemplating the principles of the reformers, it was supposed she had be-

come a convert to their opinions; at any rate she afforded protection to several divines who were persecuted for their opinions, and even interceded with her brother in favour of the reformed in his territories. She was fond of the bible, of which she got a rude translation in the French language, and from this she selected parts which she formed into scenes that were represented in her court. She wrote a work intitled "Le Miroir de l'Âme pecheresse," which was printed in 1533, and which incurred the censure of the Sorbonne. On account of her attachment to the new opinions, she underwent some ill treatment from her husband, who would probably have been more severe with her had not her brother interposed to stop his hand. His affection for her continued even after he himself had become a violent persecutor of the reformed in his own kingdom; but it must be observed that she never threw off the exterior profession of the Catholic religion, and became more assiduous in her compliance with its ceremonials as she advanced in years, and is even supposed finally to have returned to the faith in which she had been educated. "It will appear remarkable," says one of her biographers, "that a lady so much addicted to serious and pious contemplations, and certainly of unsuspected virtue, should have composed a set of tales as licentious as those of Boccaccio; but such contradictions were not uncommon at a time when the general manners were gross, and decorum was little understood." This work was entitled "L'Heptameron, ou sept Journées de la Reyne de Navarre." It was written while she was young, and was not printed till after her decease, which happened in 1549, leaving only one child, Joan d'Albret, queen of Navarre, and mother to Henry IV. The style of the L'Heptameron, &c. was lively and simple, and the stories well invented. It has been very frequently reprinted. A collection of her poems and other pieces was published in 1547, by her valet-de-chambre, John de la Haye, with the title of "Marguerites de la Marguerite des Princesses." Univer. Hist. Bayle.

MARGARET, *St.* in *Geography*, a river of Canada, which runs into the Jaguery, N. lat. 48 20'. W. long. 69 36'.

MARGARET'S *Bay*, *St.*, a port on the S coast of Nova Scotia, between Prospect harbour and Mahon bay; from which last it is separated by a promontory, on which is the high land of Aspotagoen.—Also, a bay in the English Channel, on the E. coast of Kent; five miles N N E. of Dover.

MARGARET'S *Islands*, islands in the North Pacific ocean, discovered by Capt. Magee, in the ship Margaret of Boston, in his voyage from Kamtschatka in 1780. N. lat. 24 40'. E. long. 141° 12'.

MARGARET'S, *St.*, *Island*, an island near the S. coast of Wales; three miles W. of Tenby.

MARGARICARPUS, in *Botany*, so called, as it appears, from *μαργαρον*, a pearl, and *καρπος*, fruit, because of its white round drupa. Vahl indeed, and the authors he quotes, write it *Margyricarpus*, which may surely be corrected without offence. Vahl. Enum. v. 1. 307. Class and order, *Diandria Monogynia*. Nat. Ord. *Scitocose*, Linn. *Rosacea*, sect. 3, *Sanguisorbe*, Juss.

Gen. Ch. *Cal.* Perianth superior, in four or five deep, ovate, equal segments. *Cor.* Petals four or five, ovate, smaller than the segments of the calyx; sometimes wanting. *Stam.* Filaments two, sometimes three, thread-shaped, longer than the calyx; anthers roundish, in two deeply divided lobes. *Pist.* Germen inferior, ovate, compressed; style thread-shaped, the length of the stamens; stigma peltate. *Peric.* Drupa roundish, somewhat fleshy, umbilicated, of one cell. *Seed.* Nut quadrangular, of one cell.

Obf. The flowers are said to be sometimes dioecious, in which

which case the males, at least, are furnished with petals. Vahl characterizes the genus as destitute of a corolla. The permanent leaves of the calyx have, by some persons, been taken for leaf-like styles or stigmas.

Eff. Ch. Calyx in four or five deep segments, superior. Petals smaller than the calyx. Stigma peltate. Drupa with one seed.

1. *M. fetosus*. Bristly Pearl-berry. Fl. Peruv. v. 1. 28. t. 8. f. d. *Vahl*. (*Empetrum pinnatum*; Lamarck Dict. v. 1. 567. *Ancistrum barbatum*; Lamarck Illustr. v. 1. 77.)—Native of Brasil, Peru, and the dry hills of Chili. Our specimen was gathered by Commerçon at Monte Video, in sandy ground. The stem is shrubby, round, smooth, with a deciduous scaly bark, and numerous scattered leafy branches, clothed with the permanent, rigid, brittle-like footstalks, dilated at their base. Leaves opposite, crowded, pinnate, near an inch long, of three or four pair, with an odd one, of equal, linear, pointed, entire, revolute leaflets, smooth, except some deciduous hairs at the point. Flowers axillary, nearly sessile, small. We find *stamens* and *pistil* in the same flower, the former being permanent till the fruit is ripe, as is also the style, which is curved, tipped with its white peltate stigma.

MARGARITA, FRANCESCA, DE L'ÉPINE, in *Biography*, an Italian singer, born in Tuscany, who came to England at the beginning of the last century with a German musician of the name of Greber, seems to have been one of the first female Italian singers who appeared on our stage, before any attempt had been made at an Italian opera. June 1, 1703, in the theatrical advertisement for Lincoln's-Inn-Fields, when the "Rival Queens" was promised; it is said that "Signora Francesca Margarita de l'Épine would sing, being positively the last time of her singing on the stage during her stay in England." She continued, however, singing more *last* and *positively last times* during that whole month, and never quitted England, but remained here to the end of her life. In most of the first attempts at opera in England, she performed a capital part, till the year 1708, when, retiring from the stage, she married Dr. Pepusch.

In 1704, signora Margarita sings, for the first time, at Drury-lane. At her second appearance there was a disturbance in the theatre while she was singing, which, from the natural and uncommon effects of rival malice, was suspected to have been created by the emissaries of Mrs. Tofts; an idea the more difficult to eradicate, as the principal agent had happened to live with that lady as a servant. But as the law of retaliation is frequently practised on the like occasions by the injured party, it was thought necessary, a few days after, to insert the following paragraph and letter in the Daily Courant, Feb. 8, 1704: "Ann Barwick having occasioned a disturbance at the theatre-royal Drury-lane, on Saturday night last, the fifth of February, and being thereupon taken into custody, Mrs. Tofts, in vindication of her innocence, sent a letter to Mr. Rich, master of the said theatre, which is as followeth: Sir, I was very much surprised when I was informed that Ann Barwick, who was lately my servant, had committed a rudenefs last night at the playhouse, by throwing of oranges, and hissing when Mrs. l'Épine, the Italian gentlewoman, sung. I hope no one can think that it was in the least with my privacy, as I assure you it was not. I abhor such practices; and I hope you will cause her to be prosecuted, that she may be punished as she deserves. I am, sir, your humble servant, Katharine Tofts.—To Christopher Rich, esq. at the theatre-royal, Feb. 6, 1704."

The rivalry of Mrs. Tofts, the favourite English singer, at

the beginning of the last century, and the Margarita, and the zeal of their several friends, gave rise to the first musical feud which we hear of in this country. According to Hughes, author of the *Siege of Damascus*, their abilities were disputed by the first people in the kingdom.

"Music has learn'd the discords of the state,
And concerts jar with Whig and Tory hate.
Here Somerset and Devonshire attend
The British Tofts, and ev'ry note commend;
To native merit just, and pleas'd to see
We've Roman arts, from Roman bondage free.
There fam'd l'Épine does equal skill employ,
While list'ning peers croud to th' ecstatic joy:
Bedford to hear her song his dice forsakes,
And Nottingham is raptur'd when she shakes.
Lull'd statesmen melt away their drowly cares
Of England's safety, in Italian airs.
Who would not send each year blank passes o'er,
Rather than keep such strangers from our shore."

From the connection between the Margarita and Greber, with whom she arrived in England, she became distinguished by the title of *Greber's Peg*. When she quitted Greber, she commenced another connection with Daniel earl of Nottingham, to which Rowe alludes in an imitation of an ode of Horace, "Ne sit ancillæ tibi amor puderi."

"Did not base Greber's Peg inflame
The sober earl of Nottingham,
Of sober fire descended?
That careless of his soul and fame,
To play-houses he nightly came,
And left church undefended."

The earl had written against Whiston on the doctrine of the Trinity.

An epigram, written by the earl of Halifax, is extant on the same subject.

On Orpheus and Signora Francesca Margarita.

"Hail, tuneful pair! say by what wond'rous charms,
One 'scap'd from hell, and one from Greber's arms?
When the soft Thracian touch'd the trembling strings,
The winds were hush'd, and curl'd their airy wings;
And when the tawny Tuscan rais'd her strain,
Rook furled the sails, and dares it on the main.
Treaties unfinish'd in the office sleep,
And Shovel yawns for orders on the deep.
Thus equal charms and equal conquests claim,
To him high woods and bending timber came,
To her shrub-hedges, and tall Nottingham."

The applause of the public, and admiration of individual partisans, were pretty equally bestowed on the two Sirens of the time, Mrs. Tofts and the Margarita.

The vocal merit of the Margarita must have been very considerable to have kept her so long in favour as a singer on the English stage, where, till she was employed at the opera, she sung either in musical entertainments, or between the acts, almost every night. Besides being *out-landish*, she was so swarthy and ill-favoured, that her husband, Dr. Pepusch, used to call her *Hecate*, a name to which she answered with as much good humour as if he had called her Helen. But with such a total absence of personal charms, our galleries would have made her songs very short, had they not been executed in such a manner as to silence theatrical snakes, and command applause.

Dean Swift, who was no respecter of persons, particularly musical,

musical, in his "Journal to Stella," letter xxiv. August 6, 1711, being at Windfor, says, "We have a music-meeting in our town to-night. I went to the rehearsal of it, and there was Margarita, and her sister, and another drab, and a parcel of fiddlers; I was weary and would not go to the meeting, which I am sorry for, because I heard it was a great assembly." He talks frequently of the music-meeting this summer and autumn at Windfor, but always with contempt—as, "in half an hour I was tired of their *fine stuff*."

When the Margarita retired from the stage, she is said to have accumulated a fortune of 10,000*l*. After her marriage, she applied closely to the practice of the harpsichord, upon which instrument she became a great proficient; yet never could conquer Dr. Bull's variations to an old tune called "Walsingham," in queen Elizabeth's Virginal book, which was divided and subdivided in a most full and complicated manner thirty different ways; and several of Dr. Pepusch's friends and pupils, who went frequently to her apartments at the Charter-house, have assured us, that though this curious MS. was constantly open upon Mrs. Pepusch's harpsichord-desk, she never advanced to the end of the variations; as seems likewise manifest from the colour as well as wear and tear of the leaves, which are much more clean and entire in every other part of the book than at the first strain of this composition. This lady, who had made so much noise in the world, left it very quietly in 1740.

MARGARITA *Philosophica*, the title of a musical tract. See REISCHUSI.

MARGARITA, or *Margaretta*, in *Geography*, an island in the Caribbean sea, near the coast of Terra Firma, discovered by Columbus about the year 1498. It now forms one of the provinces belonging to the royal audience of Caraccas, established in 1786; the other provinces being Venezuela, Maracaibo, Cumana, Varinas, and Guiana. The governor of Caraccas represents the monarch throughout these provinces; all the military departments being completely subject to his orders, though on great occasions he consults a "Junta de Guerra," or council of war, composed of the chief officers. Governors, however, are delegated for each province, who are appointed for five years, with a lawyer as an assessor. The island possesses but few attractions; the soil is poor and produces only cotton. It has, however, a small garrison, consisting of one company of regular troops, four of white militia infantry, one of artillery, one of cavalry, and four infantry companies of people of colour. On the first discovery of Terra Firma, a pearl-fishery, which was the principal source of the riches of the country, and of the revenues of the king, was carried on between the islands of *Cubagua* (which see) and Margarita, at the expence of the lives of a great number of Spaniards and Indians who perished in the business. The island is, perhaps, desirable as a military and commercial station; because, as it is separated from Terra Firma by a distance of only eight leagues, and to windward of all her provinces, it might become under a system of free commerce the general entrepot of Cumana, Barcelona, Caraccas, Guayra, and all the cities of the interior. This island also serves to form the channel, that separates it from Terra Firma, sometimes called "the Straits of Margarita." This channel is not navigable for the whole eight leagues of its width. The island of Coche, situated in the middle, leaves the navigator a very narrow passage two leagues from Margarita, through which he must indispensably pass. Every vessel coming from windward, or from Europe to Cumana, to Barcelona, and even to Guayra, is obliged to run down the S. side of Margarita. If this island were in the power

of the enemies of Spain, all the commerce with Europe, all intercourse with the neighbouring islands would be so much the more easily intercepted, as those which endeavoured to avoid the channel would be taken by privateers, when Margarita would serve as an arsenal. Besides, an enterprising enemy would find in the situation of Margarita means of easily diverting expeditions against any part of Terra Firma which he might wish to invade. Through the whole coast of this island there are but three ports; the first and principal is "Pampatar" to the E.S.E.; the second, called "Pueblo de la Mar," is one league leeward of the preceding; and the third is on the N. side, and therefore called "Pueblo del Norte" the village of the North. The capital city is "Assumption," built almost in the centre of the island. The whole population of the island is 14,000 persons, consisting of 5500 whites, 2000 Indians, and 6500 slaves and freed persons. The principal riches of the inhabitants are derived from the pearl-fisheries established in the island of Coche, in the middle of the channel. These fisheries are carried on by the Indians of the island, who also take a number of turtles and an immense quantity of fish, which they salt, and sell throughout the continent and neighbouring islands. They fabricate at Margaretta those hammocks of cotton, whose web is so much superior to the hammocks manufactured in any other place. They also make very fine cotton stockings, which are sold at a very dear rate. This island has also so many parrots and curious birds, that no vessel leaves the ports of Margaretta without having a small cargo of them on board. The poultry raised here becomes a resource for the poor, who sell their fowls and turkeys to the foreign islands. N. lat. 10° 56'. W. long. from Paris between 66° and 67°.

MARGARITA, (a rabbinical term), a white speck on the eye. See LEUCOMA.

MARGARITÆ. See PEARLS.

MARGARITARIA, in *Botany*, was so named by Linnæus from the kernels of its berries being of a shining white colour, and resembling pearls, margaritæ. Linn. Suppl. 66. Schreb. 694. Juss. 430. Mart. Mill. Dict. v. 3.—Class and order, *Diœcia Ôitandria*. Nat. Ord. uncertain, Juss.

Gen. Ch. Male, *Cal.* Perianth inferior, of one leaf, four-cleft, small, permanent. *Cor.* Petals four, roundish, inserted into the calyx. *Stam.* Filaments eight, brittle-shaped, spreading, rather long, inserted into the receptacle; anthers roundish, small. *Pist.* Germen superior, roundish; style brittle-shaped, the length of the stamens; stigma obtuse.—Female, on a distinct plant. *Cal.* Perianth as in the male, permanent. *Cor.* as in the male? *Pist.* Germen superior, globose; styles four or five, thread-shaped; stigmas simple, permanent. *Peric.* Berry globular, crowned with spreading, short styles. *Seeds* ovate, compressed on the inner side, inclosed in a tunic of four or five lobes and as many cells, which is cartilaginous and highly polished.

Ess. Ch. Male, Calyx four-toothed. Petals four.

Female, Calyx and Corolla like the male. Styles four or five. Berry four or five-seeded, inclosed in a cartilaginous tunic.

1. *M. nobilis*. Linn. Suppl. 428. Syst. Veg. ed. 14. 890. (*Euonymus margaritifera pentacoccus americana*; Pluk. Phyt. t. 176. f. 4)—Linnæus had several specimens of this plant, at different periods of its growth, sent by Dalberg from Surinam.—The stem is shrubby. What Linnæus conceives to be the male has opposite, oval, large, veined, entire leaves, on footstalks. Panicles formed by compound clusters of small flowers. In the Female, the branches and leaves are alternate. Stalks single-flowered. The

The *kernel* of the *berry* four or five-grained, remarkably shining and pearl-coloured.—There seems to be great reason for supposing that under these two sexes of *Margaritaria*, very different plants are described, though sent to Linnæus as different sexes of the same species. At the end of his account of *M. nobilis*, as described in the *Supplementum Plantarum*, he appears somewhat to doubt whether their union be correct.

MARGARITIMA, in *Geography*, a town of European Turkey, in Albania; 34 miles W. of Arta.

MARGARITINI are glass ornaments, made at Venice of small glass tubes of different colours, which are blown at Murano, and which the women of the lower class wear about their arms and necks. The larger sort are used for making rosaries. This work is performed with great dispatch, the artisan taking a whole handful of those tubes at once, and breaking them off one after another with an iron tool. These short cylinders are mixed with a kind of ashes, and put over the fire in an iron pan; and when the two ends begin to melt, by stirring them about with an iron wire, they are brought to a round figure; but care is taken not to leave them too long over the fire, lest the hole through which they are to be strung, should be entirely closed by the melting of the glass. There are several streets at Francesco di Vigna, entirely inhabited by people whose sole occupation is to make and string these margaritini. Keyser's Travels, vol. iii. p. 301.

MARGATE, in *Geography*, a market-town in the jurisdiction of the liberties of Dover, and county of Kent, England, is situated on the sea-coast, at the northern extremity of the Isle of Thanet, 16 miles distant from Canterbury, and 72 N.E. of London. Though now one of the most fashionable and best frequented watering-places in the kingdom, it has only obtained its principal celebrity within the last fifty years, before which it was a small fishing-town, irregularly built, and the houses generally old and low. Its antiquity, however, is much more considerable: it has been a member of the port and town of Dover from a remote period; in Leland's time there was a pier "here for shippes, but fore decayed." When the survey of maritime places in Kent was made in the eighth year of queen Elizabeth's reign, the number of houses in "Margate was 108; boats and other vessels, fifteen of various burthens, from one ton to eighteen; the persons belonging to these vessels, occupied in carrying grain and fishing, sixty." Where the pier is now built, there was anciently a small creek, which probably gave origin to the town, from the shelter it afforded to fishing-vessels and other craft. The land on each side of the creek was progressively washed away by the sea; and the inhabitants were obliged to construct a pier to prevent the town from being overflowed, and to defend that part of it which lies next the water. This pier was at first very small, and extended but a little way from the land; but the encroachments of the sea rendered it necessary to enlarge it. In queen Elizabeth's time it was maintained by certain rates paid on corn and other merchandize, which were either shipped or landed here: but, through the neglect of the persons employed, these rates were neither duly collected nor applied, and the pier went gradually to decay. By an act of parliament, (11 Geo. I.) these payments, and the application of them, were enforced, and the pier maintained till the year 1787, when another act was obtained, under which the pier has been re-built with stone, and extended so as to enlarge the harbour, and form a more complete security for shipping. To provide security to this harbour, and construct a pier in a permanent manner, have frequently been but unsuccessfully attempted: it is confidently expected that these important ends will be at length accomplished

VOL. XXII.

under the able and scientific direction of John Rennie, esq. engineer.

The improvement of the harbour, and the great resort of company to this coast, have occasioned a considerable increase in the number of fishing and other craft belonging to this port; so that the town is not only supplied with fish for its own consumption, but great quantities are continually sent to the metropolis. The whole number of packets, hoys, boats, &c. which now belong to Margate, is about seventy. Among the articles imported, are coals from Newcastle and Sunderland, and deals, hemp, tin, iron, &c. from Memel and Riga.

Margate is a large and scattered place; it is built on irregular ground; part of it being very elevated, while the other part is situated in a bottom, close to the sea-shore. The houses are principally of brick, and many of them are large and commodious. The general recommendation given by medical men to sea-air and sea-bathing, and also the fashionable propensity of spending some portion of the year at a watering-place, have been the grand causes of the extension and progressive improvements of the town. As the number of visitors increased, the buildings for their accommodation were rapidly augmented, the landholders rightly judging that the speculation would be successful. Two handsome squares have been formed; various new streets and ranges of houses have been raised, and scarcely a year passes without some additions being made. The amusement as well as the accommodation of the visitors have been provided for by the erection of hotels, lodging-houses, &c. At the south corner of Cecil-square are the assembly rooms, which form a spacious building of the Ionic order, with Venetian windows, entablature, and cornice; on the ground-floor are a billiard-room and a coffee-room, several dining-parlours, and a piazza supported by a range of duplicated Doric columns. On the first-floor are the tea, card, and ball-rooms; the latter is a very elegant apartment, eighty-seven feet in length, and forty-three in breadth: five large elegant glass chandeliers are suspended from the ceiling. Near the east corner of Hawley-square is the theatre-royal, a spacious structure, erected in the year 1787, at the expence of 4000*l*. The exterior is plain; but the interior is highly ornamented: the time of acting is restricted to the season. Other sources of amusement are found in several handsome and respectable libraries.

The bathing-rooms are situated on the western side of the High-street, near the harbour. The bathing-place is a level sandy shore, extending under the cliffs for several miles, and forming, at proper times of tide, a pleasant walk. But the most fashionable promenade is the pier, which, being finished by a parapet breast high, is perfectly safe, and is the general resort of the company.

Margate was anciently a chapelry to Minster, but was made parochial in the year 1290. The church, a spacious edifice, stands on an elevated spot at the south-east side of the town; it consists of a nave, chancel, and aisles, with a square tower at the north-west angle. The nave is divided from the aisles by eight arches, springing from octagonal and round columns; the latter have ornamented capitals in the Norman style. The monuments and brasses within the walls are numerous, and several of them are of considerable antiquity. Besides the church, here are four places of religious worship; one for Baptists, one for Roman Catholics, a third for the followers of Mr. Wesley, and the fourth, called Zion-chapel, on the establishment of the late countess of Huntingdon. The principal charitable institutions are a general sea-bathing infirmary, established in 1792; Draper's hospital, or alms-houses for widows, erected in 1709, pursuant to the will of Michael Yoakley, a Quaker; and a charity.

charity-school, built in 1787, for forty boys and forty girls.

There appears to have been a market kept here in the time of Charles I., of which a monthly return was made to Dover; but this was soon discontinued. Well-supplied markets are now held on Wednesdays and Saturdays, under a grant made in the year 1777 to Francis Cobb and John Baker, then wardens of the pier, and their successors. Under the population act of 1800, the number of inhabitants of this parish was 4766, occupying 1115 houses: whereby it appears that the population has been nearly doubled since Lewis wrote his History of the Isle of Thanet, in 1723. A Picture of Margate, &c. 12mo. 1819. Haisted's History of Kent, 12 vols. 8vo. Brayley's Beauties of England, &c. vol. viii. 8vo. 1807.

About a mile distant from Margate is situated Dandelion, so named from the original possessor, Dent de Lyon, who came to England with William the Conqueror. There still remain four towers, and a fine antique gate-house, of the original building, composed of alternate layers of brick and flint. On a scutcheon the armorial bearing and name of the founder may still be seen. Here are a fine garden and bowling-green, whence there is a beautiful and extensive view of Margate roads, the sea, and shipping. In this garden public breakfasts, with music and dancing, are given twice a week during the season. They are under the regulation of the master of the ceremonies, and constitute one of the most agreeable and rational amusements of this place.

The country around Margate is very fertile, and peculiarly healthy. The probable reasons of the salubrity of the Isle of Thanet are detailed in the preface to Dr. Buchan's "Treatise on Sea-Bathing," which will be found an useful companion to all persons resorting to the sea-coast on account of their health.

MARGEN, in the *Materia Medica*, a name used by some of the later Greek writers to express red coral. It is founded on an error, however; the word *margen* being made from the Arabian *margian*, which does not signify coral, but a purple seawrack, or fucus, used in dyeing. See MARGIAN.

MARGENFELT, in *Geography*, a town of Prussia, in the province of Oberland; 11 miles S. of Osterrod.

MARGENGAW, a town of Prussia, in the province of Pomerelia; six miles N. of Marienburg.

MARGENSTEIN, in *Natural History*, a name given by the German writers to a sort of indurated marle, which, while in the strata, is nearly of the hardness of stone; but when laid on the surface of the earth, and exposed to the wind and rain, soon dissolves, and enters the pores of the ground, enriching the soil to a very great degree.

We have the same sort of stony marle in some parts of England; only that our's is less hard, and yet takes more time to break and dissolve in the air. They are both most proper for lands of a loose loamy nature, and keep them in heart a long time.

MARGGRABOWA, in *Geography*, a town of Prussia, in the Lithuanian department; 80 miles S.E. of Königsberg. N. lat. 53 54'. E. long. 22° 47'.

MARGGRAF, ANDREW SIGISMOND, in *Biography*, a celebrated chemist, was born at Berlin in the year 1709, where his father was apothecary to the court, and assessor of the college of medicine. Thus situated from his early years, his attention was naturally turned to the pursuits of chemistry and pharmacy, for which he imbibed a taste, which he afterwards cultivated with great industry under the celebrated professor Neumann, during a period of five years, and subsequently under professor Spielmann, at Strasbourg. In 1733, he went to the university of Halle, where

he became a pupil of Hoffmann in the study of medicine, and continued his chemical pursuits under the direction of Juncker, to which last science he ultimately devoted his sole attention. For the purpose of obtaining practical information on the subject of mineralogy, he resorted to Freyberg, in Saxony, in 1734, where Dr. Henckel was then in high reputation in that department of natural history; and he practised the art of assaying under Sufmilleh. In the following year he visited the Hartz mines, and then returned to Berlin, where, by a close and incessant application to his chemical labours, he so materially injured his health, that it was never afterwards vigorous. He passed the remainder of his life in his native city, notwithstanding an offer of the place of ducal apothecary to the duke of Brunswick, with a department in the mines, which was made to him in 1737 by that prince, but which he did not deem sufficiently advantageous to induce him to leave Berlin. In 1738, he was received into the Society of Sciences, and furnished some memoirs for the "Miscellanea Berolinensia;" and when this society was renovated in 1744, as the Royal Academy of Sciences and Belles Lettres, he was placed in the class of experimental philosophy, of which he was chosen director in 1760. He had also the high gratification of being entrusted with the laboratory of the academy in 1754, in which he almost lived, absorbed in the study or practice of his favourite art. He was, nevertheless, a man of great amenity of temper and considerable conviviality, when mixing in the society of his friends. He had been for some years liable to spasmodic affections, and, in 1774, was attacked with apoplexy, which left a paralysis behind it. He continued, however, to attend the meetings of the academy till the autumn of 1776; after which his mental and bodily powers gradually declined, and he died in August, 1782.

Marggraf was held in considerable estimation as a chemist throughout Europe, and had the honour of being elected a member of several learned bodies. All the writings which he produced were published in the Memoirs of the Literary Society of Berlin, before and after its renovation; but they have been collected and published both in German and French. They contain the details of a great number of processes and analyses, described in clear and simple language. Some of the most important of his discoveries relate to phosphorus and its acid; to the reduction of zinc from calamine; to the fixed and volatile alkalies; to manganese, the Bolognian stone, platina, and the acid of fugar. In short, he is entitled to rank among the more accurate experimentalists, who contributed to the advancement of the science of chemistry, before the recent luminous improvements which it has gained. Gen. Biog. See also his Eloge in the Mem. de l'Acad. Roy. de Berlin.

MARG-GRAVE. See MARGGRAVE.

MARGIAN, in *Botany*, a name given by some of the ancient writers, particularly the Arabian physicians, to the plant called by others *argina*, or *arginem*. This is described to be a purple sea-plant. Some have supposed that cochineal was meant by this word, but that is an error. Others have come somewhat nearer, in supposing it to be the name of coral; but as the ancients have said that it was used in dyeing, it could not be coral; and indeed there is no other plant that it can mean, but that fucus used by the Greeks in dyeing, and called *fucus porphyrixon*, or the purple-dyeing sea-plant.

MARGIANA, in *Ancient Geography*, a country of Asia, along the river Margus, from which it derives its name. According to Ptolemy, it had Hyrcania on the W., on the N. Oxus, on the E. Bactriana, and on the S. Aria. The people who inhabited it were the Derbica, the Massageta, the Tassoni, the Parni, and the Dax. Its towns were Ariaca,

Ariaca, Sina, Aratha, Argadris, Jafonium, Rhea, Antiochia, Guriano, and Niceai. Pliny gives us a very favourable notion of the situation and fertility of this country. It now forms a part of *Khorasan*, which see.

MARGIANI, in *Geography*, a town of Persia, in the province of Comis; 25 miles N. of Bitan.

MARGIDUNUM, in *Ancient Geography*, a place of Great Britain, situated, according to the sixth Iter of Antonine, between Verometum (near Willoughby) and Ad Pontum (near Southwell.) Dr. Stukeley places it at Bridgeford, but Mr. Horsley, and some other antiquaries, fix it near East Bridgeford.

MARGLINAN, in *Geography*, a town of Turkestan, at the union of a river of the same name with the Sirr; eight miles S. of Tafchkund.

MARGOT, a river and heights of America, situated on the E. side of the Mississippi. The course of the river is westerly, and it is said to be navigable for batteaux for a number of miles. The ground below its junction with the Mississippi, in N. lat. $35^{\circ} 28'$, affords a commanding, airy, pleasant, and extensive situation for settlements: the soil is remarkably fertile.

MARGOT Port, a maritime village on the N. side of the island of St. Domingo, in N. lat. $19^{\circ} 48'$; nine leagues W. of cape François.

MARGOZZA, a town of Italy, giving name to a lake near it; 40 miles N.W. of Milan.

MARGUARSTEIN, a town of Bavaria, on the Acha; 25 miles W. of Salzburg.

MARGUERITAS, ISLES *of*, islands in the Mediterranean, near Ivica, one of which is large and near Pic Nono, which advances into the sea, in the form of a cone, covered with trees.

MARGUERITE, ST., an island in the Mediterranean, near the coast of France, nine miles from Antibes. N. lat. $43^{\circ} 31'$. E. long. $7^{\circ} 7'$.

MARGUERITE, a river of America, which runs into lake Michigan, N. lat. $44^{\circ} 2'$. W. long. $85^{\circ} 34'$.

MARGUERITES, a town of France, in the department of the Gard, and chief place of a canton, in the district of Nimes; four miles N.E. of Nimes. The place contains 2057, and the canton 6359 inhabitants, on a territory of $157\frac{1}{2}$ kiliiometres, in eight communes.

MARIA, AVE. See AVE MARIA.

MARIA THERESA, in *Biography*, empress of Germany, and queen of Hungary, daughter of the emperor Charles VI. was born at Vienna in 1717, and married Francis of Lorraine, grand duke of Tuscany, in the year 1736. At the death of her father in 1740, she remained sole heiress of the dominions of the house of Austria, which had been assured to her by the Pragmatic sanction, guaranteed by almost all the powers of Europe. The hope of despoiling an unprotected female was, however, too great a temptation to be overcome by mere treaties, and claims were made on all sides to part or the whole of the inheritance. She, however, took quiet possession of it, and ingratiated herself with all her subjects. The storm first broke upon Silesia, which Frederic II. of Prussia seized. He soon secured to himself the possession of this rich province by a victory, and his success induced the court of France, in conjunction with the elector of Bavaria, to enter into the war. Unable to contend effectually with the combined forces, Maria Theresa hastily retired to Presburg, where, assembling the states of the kingdom, she appeared with her infant son in her arms, and made such an animating and affecting address, that the nobles all drew their sabres, and solemnly swore they would die in defence of the rights of their sovereign.

A powerful army was raised, which marched to Vienna, and secured it from assault, so that the enemy could only boast of the capture of Prague, and of having been the means of crowning the elector of Bavaria king of Bohemia. He was, shortly after this, by the influence of the French, elected emperor of Germany. England felt an interest in behalf of the queen, and joined her as an ally, while individuals of almost every rank opened their purses in aid of her cause. She prudently detached from the confederacy the king of Prussia, by ceding to him Silesia, and she contrived likewise by other cessions to detach the king of Poland, elector of Saxony, from the number of her enemies. Without attempting to detail the occurrences of this war, which involved most of the powers of Europe, we may observe, that Maria Theresa displayed, through the whole of the contest, a degree of firmness and vigour, which would have done honour to any sovereign; that she was crowned queen of Bohemia at Prague, in 1743, that she placed the imperial crown upon the head of her husband in 1745, and that by the peace of Aix-la-Chapelle, in 1748, she was confirmed in the possession of all her dominions, excepting Silesia, which remained in the hands of the king of Prussia. On the restoration of peace, the empress queen, the title by which she was usually known, turned her attention to the improvement of her dominions, by encouraging commerce and the useful arts. New ports were opened, and new sources of trade explored; canals were formed and manufactures established; schools and public libraries were founded, and a college for the sciences was instituted at Vienna. This and a multitude of other acts bore witness to the zeal and intelligence with which this sovereign and her ministers pursued the great objects of public good. People are always grateful for the beneficent acts of their governors, and it was impossible for love and veneration to be carried farther than those which were inspired by a sovereign, who, to female beauty and gentleness, added masculine dignity and excellence. The court of Vienna could not brook the loss of Silesia, and, in revenge, it instigated a confederacy against Frederic, with the view of depriving him of his conquests, and perhaps of despoiling him of a part of his hereditary dominions. For this purpose an alliance was formed of the empress-queen, the empress of Russia, and the king of Poland as elector of Saxony; Frederic discovered their plan and thwarted it. Soon after this the house of Austria joined France in an attack upon the king of Prussia, who was able to make a treaty with England. Frederic struck the first blow and carried his arms into Bohemia, which was the commencement of what is generally called the seven years' war. The junction of Russia with his other enemies brought Frederic to the brink of ruin. He was, however, saved by his own great and almost unparalleled efforts, and the treaty of 1763 confirmed him in the possession of Silesia, and restored Germany to its former political state. The only advantage gained by the empress-queen, was the election of her son Joseph to the succession of the empire as king of the Romans. In 1765, she lost her husband, the emperor Francis, with whom she had lived in constant and affectionate union thirty years. So strong was her attachment to the memory, as it had been to the person of her husband, that she ever after wore mourning, and paid frequent visits to his tomb. In 1772, a plan was laid for the first dismemberment of Poland, to which it was with the utmost difficulty that the consent of Maria Theresa could be obtained. Her son Joseph, fixed on the object, and knowing her failings, addressed to her the argument of religion, which subdued her scruples, that were unquestionably founded in rectitude, and ought not

to have been subverted. From this period she did not interfere much in the management of public affairs, though she did not hesitate to check the innovations of her son, especially those which went to the abolition of convents, and other changes in the church establishment. She died at Vienna, in the autumn of the year 1780, at the age of sixty-three, consoling herself in her last moments with the purity of her intentions in all her conduct, and with the idea of having merited the honourable title of the "mother of her people." She left a numerous progeny, of whom one son Joseph II. was emperor; another the grand-duke of Tuscany; one daughter queen of France, another of Naples; "happy" says Dr. Aikin "that she could not look into the awful secrets of futurity." A warm attachment to the duties of her religion was a prominent feature in her character; in some instances, perhaps, her zeal approached the borders of bigotry and intolerance; it must, however, be allowed, that her conduct in general displayed all the salutary influence of religious principles, and that as a wife, a mother, and a sovereign, she has had few equals upon the throne. Hist. of France. Gen. Biog. London 1790.

MARIA, in *Ancient Geography*, a town of Italy, in Venetia; situated on the Padus, towards the S.E., and very near Hadria.

MARIA, in *Geography*, a river of America, which runs into the Mississippi, N. lat. $37^{\circ} 37'$. W. long. $90^{\circ} 33'$.—Alfo, a town of South America, in the province of Carthagenia; 32 miles W. of Carthagenia.—Alfo, a river of Honduras, which runs into the bay, N. lat. $15^{\circ} 40'$. W. long. $87^{\circ} 15'$.

MARIA Bay, a bay on the N. coast of Tongataboo; seven miles W. of Observatory Point.

MARIA, *St.*, a town of Transilvania; 12 miles S.E. of Hunyads.—Alfo, a town of Naples, in Lavora; 37 miles W. of Naples.—Alfo, a town of Istria; four miles N. of Monfalcone.—Alfo, a town with a convent of Hungary; six miles N. of Rosenburg.—Alfo, one of the Tremiti islands, now called "St. Nicolo'."—Alfo, a sea-port of the Ligurian Republic, in the gulf of Spezza; four miles S. of Spezza. N. lat. $44^{\circ} 6'$. E. long. $9^{\circ} 42'$.—Alfo, a small island near the coast of Chili. S. lat. $37^{\circ} 10'$.—Alfo, a town of Brasil, in the government of Maranhao; eight miles N.E. of St. Felipe.—Alfo, a town of Mexico, in the province of Mechoacan; 32 miles S. of St. Luis de Potofi.—Alfo, a town on the W. coast of the island of Mindanao. N. lat. $7^{\circ} 33'$. E. long. $122^{\circ} 18'$.—Alfo, a small island in the Grecian Archipelago, near the N.E. coast of Paros.—Alfo, a town of New Mexico; 40 miles S. of Santa Fé.—Alfo, a town of New Navarre; 210 miles S.S.E. of Casa Grande.

MARIA della Alizza, a town of Naples, in the province of Otranto; four miles E. of Gallipoli.

MARIA di Camarana, *St.*, a town of Sicily, in the valley of Noto, at the mouth of a river on the S. coast; the remains of a city called "Camarana;" 28 miles S.E. of Alicete.

MARIA del Alto, a town of Naples, in Otranto; two miles S.S.W. of Nardo.

MARIA Apollano, *St.*, a town of Naples, in Capitanata; three miles S. of Monte St. Angelo.

MARIA di Dotoli, *St.*, a town of Naples, in Otranto; 15 miles S.E. of Motera.

MARIA della Gratia, a town of Italy, in the department of the Mincio; five miles W. of Mantua.

MARIA la Garta, *St.*, a small island in the N. Pacific ocean. N. lat. $27^{\circ} 50'$. W. long. 149° .

MARIA della Gratice, a town of Naples, in Calabria Citra; six miles N. of Scalea.

MARIA dell' Isola, a town of Naples, in the province of Bari; three miles N. of Conversano.

MARIA di Leuca, *St.*, a town of Naples, in Otranto, on the sea-coast near cape Leuca; the see of a bishop; 18 miles S. of Otranto.

MARIA Palomba, *St.*, a town of Naples, in Otranto; five miles E.N.E. of Matera.

MARIA della Serra, *St.*, a town of Naples, in Calabria Ultra; 11 miles E. of Nicastro.

MARIA de Iguazu, *St.*, a town of Paraguay; 200 miles E. of Assumption.

MARIA de Ijquande, *St.*, a town of South America, in Popayan; eight miles N.W. of Barbacoa.

MARIA de Monte, *St.*, a town of Italy; three miles E. of Friuli.

MARIA de Matamba, *St.*, a town of Africa, capital of Matamba. S. lat. $9^{\circ} 35'$. E. long. $18^{\circ} 34'$.

MARIA de Darien, *St.*, a town of South America, and capital of the province of Darien, on a river which runs into the bay of Panama. N. lat. $8^{\circ} 4'$. W. long. 78° .

MARIA del Gracia, a town of Etruria; 31 miles E. of Florence.

MARIA Creek, a river of the western territory of America, which runs into the Wabash, N. lat. $38^{\circ} 48'$. W. long. 88° .

MARIA, *Van Diemen, Cape*, the N.W. point of New Zealand. S. lat. $34^{\circ} 30'$. W. long. $187^{\circ} 18'$.

MARIA Zell, a town of the duchy of Stiria; 12 miles N. of Pruck.

MARIA's Islands, a cluster of islands, near the south part of New Holland, somewhat N.E. of Tannan's Head. S. lat. $43^{\circ} 15'$. E. long. $147^{\circ} 46'$ to $148^{\circ} 10'$.

MARIA, *Santa, Cape*, the N. cape at the mouth of La Plata river, in South America; 9 leagues from the bay of Maldonado, and 20 from Montevideo, a bay so called from a mountain which overlooks it.

MARIA Theresa, *Order of*, in *Heraldry*, a military order, which was instituted by the empress queen on the 18th of June, 1757, and composed of two classes, *viz.* Grand Crosses and Knights. To these the emperor Joseph II. in the year 1765 added an intermediate class, under the appellation of Commanders. The number of knights is not fixed, and the emperor is grand master. The badge of the order is a cross of gold, enamelled white, edged with gold; on the centre are the arms of Austria, *viz.* gules, a fesse argent encircled with the word FORTITUDINI; on the reverse is a cypher of the letters M. L. F. in gold, on an enamelled green ground. The badge is worn pendent to a striped crimson and white ribbon.

MARIAGALANTE, in *Geography*. See MARIEGALANTE.

MARIAGER, a sea-port town of Denmark, in North Jutland, situated on a gulf which communicates with the Cattegat, called "Mariagerfiord." Its principal trade consists in stone and lime; 22 miles E.N.E. of Wiborg. N. lat. $56^{\circ} 43'$. E. long. $9^{\circ} 53'$.

MARIALVA, a town of Portugal, in the province of Beira; 16 miles N.E. of Pinhel.

MARIAM, a town of Abyssinia; 100 miles E.S.E. of Gondar. N. lat. $11^{\circ} 2'$. E. long. $33^{\circ} 34'$.

MARIAME, in *Ancient Geography*, an episcopal town of Phœnicia, the sovereignty of which was confirmed by Alexander the Great to Garalotratus, king of Arad.

MARIAN, or MARIANNE, *Islands*, in *Geography*. See LADRONES.

MARIANA,

MARIANA, JUAN DE, in *Biography*, a celebrated historian, was born at Talavera in 1536. He was an illegitimate child of Juan Martinez de Mariana, afterwards canon and dean of the collegiate in that town. He received an excellent introductory education, and was sent at a proper age to Alcalá, an university of considerable reputation. Soon after this Ignatius Loyola sent missionaries into Castile to establish his order there, and Mariana, who was only in his seventeenth year, joined them. At the age of twenty-four he was appointed to the professorship of theology at the great college lately established at Rome. Here he lectured four years, and had among others the famous Bellarmine as one of his pupils. From Rome he went to Sicily to open a course of theology which the company had begun there. After a residence of two years in that island, he was sent to Paris in the same capacity, where for five years he publicly expounded Aquinas, and the degree of doctor was, on account of his great learning, conferred upon him. Not having his health at Paris, he obtained permission to resign his chair and retire to Toledo, where he was elected to various high offices in the church, and was employed by the archbishop in forming a catalogue of prohibited books, and the Index Expurgatorius, which was published in 1584. About this time he bore a part in the edition of St. Isidore's works, and incurred some suspicion by the freedom with which he espoused the cause of Arias Montanus. Mariana had long aspired to be the historian of his own country, and in the little leisure which his superiors left him, he followed the indications of his genius. "Nature," says his biographer, "had designed him for something better than to expound Thomas Aquinas, and to emasculate books for the inquisition: The result of his labours appeared in 1592, in a work under the title of "Historiæ de Rebus Hispaniæ Libri xx." It was afterwards extended to thirty books: the most complete edition is that of Mentz. The history comes down to the end of Fernando's reign, the author being fearful of coming nearer to his own times, lest he should give offence by speaking the truth. The work is in high estimation, and it is said that they who read the history of Spain for entertainment will always read it in Mariana; he is the historical classic of his country. In 1599 he published his treatise "De Rege et Regis Institutione," which was burnt by order of the parliament of Paris. He was author of many other works, the titles of several of which are enumerated in the "General Biography," some of these, viz. "De Morte et Immortalitate;" and "De Monetæ Mutatione," exposed him to persecution, imprisonment, and to those evils that ever attach to a man, whom the higher powers, whether justly or unjustly, choose to suspect. Mariana had, however, a mind not to be borne down by the weight of authority, and could in that privacy and retirement into which he was driven, give up all his powers in the pursuit of science and literature. His last publication consisted of Scholia upon the Old and New Testament, with an elegiac version of the Proverbs, Ecclesiastes, and Solomon's Song. He died at Toledo on the 16th of February, 1623. "The Jesuits," says Mr. Southey, "have often maintained the rights of the people for the sake of their own order: this was not Mariana's case: his views were of a wider range; he thought of mankind, not of the company."

MARIANA, in *Ancient Geography*, a town and Roman colony of Corsica, established by Marius: it was episcopal, and its ruins now bear its name. It is now the see of a bishop; 16 miles S. of Bastia.

MARIANA, in *Geography*, a town of Italy, in the Veronese; 8 miles N.N.W. of Verona.—Also, a town of Italy,

in the department of the Mincio; 15 miles S.W. of Mantua.

MARIANDYNI, in *Ancient Geography*, a people of Asia, in Bithynia, or extending from Bithynia to Paphlagonia, on the banks of the gulf of Sangarus. Herodotus (l. i. c. 28.) reckons them among the nations subdued by Cræsus.

MARIANKA, in *Geography*, a town of Poland, in Volhynia; 44 miles N.N.W. of Zytomiers.

MARIANNA, the name given to a district of America, granted by the Plymouth council to Capt. John Mason in 1621. It extended from the river Naumkeag, now Salem, round cape Ann to Merrimack river, and from the sea to the heads of these rivers, with the islands lying within three miles of the coast.

MARIANO, a town of Italy, in the department of the Olona; 12 miles N. of Milan.

MARIANOPOLI, or MARIUPOL, a sea-port town of Russia, on the borders of the sea of Azof, between the rivers Myus and Calmuis. This town, as well as Kherfon or Cherfon, and Catharinopol, together with the numerous villages, which have risen into some degree of importance in a country formerly inhabited only by lawless banditti, or traversed by roving hordes, are filled with Russians, with Tartars reclaimed from their wandering life, and with numerous colonists, particularly Greeks and Armenians, who migrated from the adjacent provinces of the Turkish empire. N. lat. 47°. E. long. 37° 44'.

MARIANOU, a town of Poland, in the palatinate of Braclaw; 48 miles W. of Braclaw.

MARIAQUACO, a town of Brazil, on the river of the Amazons; 36 miles W. of Pauxis.

MARIAS ISLANDS, three islands in the North Pacific ocean, occupying a space of about 42 miles. The most northern, which is the largest of the group, is about 13 miles long in a S.E. by E. and N.W. by W. direction, the direction in which the islands lie from one another, and about 9 miles broad. It is highest towards the S., and gradually descends, terminating in a long low point at its N.W. extremity. Its shores are composed, particularly on the S.W. side, of steep white rocky cliffs, which kind of substance forms its principal component part. Notwithstanding a low kind of shrub, with which it is partially covered, it presents but a dreary and unproductive scene. Its S.E. extremity terminates also, after a descent from the summit of the island, in a low projecting point, with rocks lying from it, as on the opposite extremity. On either side is a small bay, that on the E. side being bounded by a beach, composed alternately of rocks and sand, and affording, by Capt. Vancouver's soundings in its vicinity, good anchorage, and protected against the general prevailing winds. Between this island and the second of the group, called by Dampier "Prince George's island," is a passage about six miles wide, with soundings of 20 to 30 fathoms, and sandy bottom. The S.W. side of this latter island is bounded by detached rocks, some of which descend from the centre of the island and terminate at the water side, in a fine sandy beach. This island abounds more with vegetable productions than the other, but it did not seem to afford any streams of fresh water. In size and direction Prince George's island is next to the former, being about 24 miles in circuit; and the third, or southernmost, is about nine miles in compass. The most valuable production of Prince George's island is lignum vitæ, which it yields in great abundance, besides some plants of the orange and lemon kind, and other thorny plants, which reach nearly to the edge of the water. Of birds this island

island has great variety, such as hawks, green parrots with yellow heads, parroquets, pigeons, and doves, and small birds of beautiful plumage; but no quadrupeds were seen. On the shores great numbers of fish were observed, and among them some very bold and daring sharks. A few snakes and guanoes were seen; but no traces of human visitors were perceived; though on shore some drift wood was found, which appeared to have been wrought with European tools. Capt. Vancouver's anchoring place lay in N. lat. 21° 28'. E. long. 253° 54'.

MARIASTAIN, a town of Austria; 14 miles S.S.W. of Steyr.

MARICA, in *Botany*, an old name for something of the *Iris* kind. Ambrosinus thinks it a corruption of *Naronica*, which was derived from the Naro, a Dalmatian river, about whose banks the best *Iris* or *Orris* roots were plentifully produced. The name is retained by Schreber for the *Cipura* of Aublet. Mr. Gawler, now Ker, who has referred to this same genus some additional species, separated from *Iris*, *Moræa* and *Sifyrinchium*, properly follows Schreber in the name; but enquires, in *Curt. Mag.* p. 646, why *Cipura* was rejected. We presume that as Aublet has given no explanation of its meaning, and nothing is to be guessed from any part of his description, Schreber judged it, at any rate, a hybrid, if not a barbarous, name; and he was too critical a scholar, as well as too faithful a Linnæan, to admit such in general. How he would justify his own barbarous and uncouth *Bambusa*, for what Jussieu has properly called *Nastus*, we will not venture to guess. See *BAMBUSA*, *NASTUS* and *CIPURA*.—Schreb. 37. *Willd. Sp. Pl.* v. 1. 246. *Mart. Mill. Dict.* v. 3. *Gawl.* in *Sims* and *Kon. Annals of Bot.* v. 1. 244. *Curt. Mag.* 654. *Ait. Hort. Kew. ed.* 2. v. 1. 122. (*Cipura*; *Aubl. Guian.* 38. *Juss.* 58. *Lamarck Illustr.* t. 30) *Class* and order, *Triandria Monogynia*. *Nat. Ord. Enfatæ*, *Linn. Irides*, *Juss.*

Gen. Ch. *Cal.* Spathas of one or two valves, single-flowered, enclosed in a common involucre of two valves. *Cor.* superior, regular, in six deep spreading segments, united into a tube; the three inner alternate ones smaller. *Stam.* Filaments three, distinct, inserted into the mouth of the tube, very short; anthers oblong, erect, longer than the filaments. *Pist.* Germen inferior, oblong, obscurely triangular; style simple, triangular, its angles opposite to the stamens; stigmas three, longer than the style, variously shaped, more or less cohering in a triangular figure. *Peric.* Capsule oblong, bluntly triangular, coriaceous, of three cells and three valves, as if peeled at the top. *Seeds* numerous, in two rows, roundish, somewhat angular.

Ess. Ch. *Corolla* superior, in six deep segments; the three inner ones smallest. *Stamens* opposite to the three angles of the style.

Obs. Mr. Ker now includes in this genus some species with united filaments, which we agree with our late friend Mr. Dryander (in *Ait. Hort. Kew.*) in referring to *Sifyrinchium*; a measure justified, if we mistake not, by the habit of their flowers.

1. *M. Northiana*. Broad-stemmed Marica. Ker in *Curt. Mag.* t. 654. (*Moræa Northiana*; *Andr. Repof.* t. 255. *M. vaginata*; *Redout. Liliac.* t. 56.)—Stalk sword-shaped, winged.—Native of the Brazils. It was first known here in the collection of the Hon. Mrs. North, at Farnham castle, who procured it in 1789. The plant is now frequent in hot-houses, flowering in spring and summer, being much admired for the beauty of its short-lived petals, whose bases are all elegantly mottled with yellow and deep brownish orange, while the limb of the larger ones is white, of the smaller

blue. The root is tuberous, with many fibres, and perennial. Leaves radical, sword-shaped, dark green, ribbed, two or three feet high. Flower-stalk much resembling the leaves, about as tall, though rather narrower, oblique, bearing several successive fragrant flowers, about two inches in diameter, from a lateral sheath near the top, sometimes viviparous.

2. *M. martinicensis*. Yellow Martinico Marica. (*Iris martinicensis*; *Linn. Sp. Pl.* 58. *Jacq. Amer.* t. 7. *Willd. Sp. Pl.* v. 1. 238. *Curt. Mag.* t. 416. *Redout. Liliac.* t. 172.)—Stalk round. Leaves linear, flat.—Jacquin found this species in moist meadows among the hills of Martinico, flowering in November and December. Mr. Alexander Anderson sent it from St. Lucia to Kew in 1782. It blooms in the stove with us about May or June, and is perennial; but bearing only small flowers, of an uniform yellow, is not particularly esteemed. The late Mr. Curtis has justly remarked its ill agreement with the character of an *Iris*, and its generic affinity to the foregoing. The leaves, however, are narrower, flat, and single-ribbed. Stalk slender, round, 12 or 18 inches high, with one or two concave distant bractæas. Flowers few, successive, very transient, inodorous, about an inch wide. It ripens seeds abundantly, which *M. Northiana* does not.

3. *M. paludosa*. Dwarf Marsh Marica. *Willd. Sp. Pl.* v. 1. 246. *Curt. Mag.* t. 646. (*Cipura paludosa*; *Aubl. Guian.* 38. t. 13.)—Leaves lanceolate, tapering at each end, plaited. Stalk round. Inner segments of the corolla erect, concave, half the length of the outer.—Native of moist meadows, called savannahs, at the foot of the mountains in Guiana. Mr. A. Anderson sent it from St. Lucia to Kew in 1792. The plant is perennial, flowering in the stove from June to August. Its leaves are about a foot high, deep green, lanceolate, tapering much at each end, strongly plaited on each side the midrib. Flower-stalk radical, very short, simple, bearing a small tuft of successive, short-lived, white flowers, accompanied by a few sheathing scales, and surmounted by a long leafy bractæa equal to the leaves. The three inner segments of the corolla are erect or convoluted, but half the length of the rest, concave, a little recurved at their summits, and tipped with green, so that the whole flower recalls the idea of a Snowdrop.

4. *M. plicata*. Small-flowered Marica. Ker in *Curt. Mag.* t. 655. (*Moræa plicata*; *Willd. Sp. Pl.* v. 1. 243. *Swartz. Ind. Occ.* 82. *M. palmifolia*; *Jacq. Ic. Rar.* t. 227. *Sifyrinchium palmifolium*; *Cavan. Diff.* 348. t. 19. f. 1. *Bermudiana palmæ folio, radice bulbosa*; *Plum. Ic.* 35. t. 46. f. 2.)—Leaves elliptic-lanceolate, with numerous ribs and plaits. Stalk round. Segments of the corolla all nearly equal in length.—Native of Cayenne and the West Indies. Miller is said, in *Hort. Kew. ed.* 1. v. 3. 305, to have cultivated it at Chelsea, in 1739. Linnæus had specimens, which he confounded with his true *Sifyrinchium palmifolium*, which has a winged stalk, and a dense corymbose tuft of many flowers. We have it not in any of our gardens. *M. plicata* is a tender stove plant, with much broader and more elliptical leaves, whose ribs and plaits are much more numerous than *M. paludosa*. The stalk, moreover, is almost as tall as the leaves, and the bractæa proportionably smaller. The flowers are small and white, distinguished by all their segments being nearly of equal length, and obovate, though the three innermost are rather the narrowest. They have little beauty to attract general admiration or care.

Mr. Ker comprehends under this genus of *Marica*, besides the above, the *Sifyrinchium palmifolium*; *Linn. Mant.* 122. *Willd.*

Willd. Sp. Pl. v. 3. 579, of which no figure, as far as we know, exists; and the *S. striatum*, Sm. Ic. Piët. t. 9. Willd. ibid. 580; though he observes, in the Annals of Botany, v. 1. 246, that *Sisyrinchium* differs from *Marica* in having united filaments and nearly round (or globose) capsules. Now we can positively assert that the latter species answers to this character, besides having the corolla of a *Sisyrinchium*. Its filaments compose a firm columnar tube, nearly to their very top. As far as we can judge by the specimen of *S. palmifolium*, its germen and corolla agree exactly with the *striatum*, and we cannot doubt its belonging, as Willdenow observes, Sp. Pl. v. 1. 244, to the same genus. A winged or two-edged stalk seems proper to *Sisyrinchium*. S.

MARICA *Silva*, in *Ancient Geography*, a forest of Italy, in Campania, which was situated in the vicinity of the town of Minternæ, towards the mouth of the river Liris.

MARICABAN, in *Geography*, one of the smaller Philippine islands, near the S. coast of Luçon. N. lat. $13^{\circ} 52'$. E. long. $120^{\circ} 56'$.

MARICELLO, a town of Naples, in the province of Bari; 6 miles N.W. of Gravina.

MARICHI, in *Hindoo Mythology*, is deemed by Sir William Jones, in his dissertation on the chronology of the Hindoos, Asiatic Researches, vol. ii. to be a personification of light. In the wild theogonies of that poetical race he is made the offspring of Brahma, and father of Kasyapa, the prolific parent of Surya, or the sun, and many other divinities. See KASYAPA, in the seventh line of which article for all read *use*.

MARICI, in *Ancient Geography*, a people of Italy, in the vicinity of the *Loevi* (which see), who inhabited a tract now called "Pavesan," watered by the Tesino and the Po.

MARICOLAM, in *Geography*, a town of Hindoostan, in Cochin; 20 miles N.N.E. of Cranganore.

MARI-DSAKE', a lake of Thibet, about 30 miles in circuit. N. lat. $34^{\circ} 22'$. E. long. $88^{\circ} 50'$.

MARIDUNUM, in *Ancient Geography*, a town of the isle of Albion, belonging to the Demetæ, and supposed to have been situated where Caermarthen, in South Wales, now stands.

MARIE, STRAITS of, in *Geography*, connect lakes Superior and Huron. Near the upper end of these straits, which are 40 miles long, is a canal navigable by boats. The straits afford a pleasing view of various islands.

MARIE, *St.*, a town of France, in the department of the Lower Pyrenees, separated from Oleron by a river, and connected with it, at the distance of two miles, by a bridge of stone.

MARIE, *St.*, a town on the N.W. coast of the island of Martinico.

MARIE d'Aruci, *St.*, a town of France, in the department of Mont Blanc; 15 miles N.W. of Chambéry.

MARIE de la Mer, *St.*, a town of France, in the department of the Eastern Pyrenees, near the coast of the Mediterranean; nine miles E.N.E. of Perpignan.

MARIE aux Mines, a town of France, in the department of the Upper Rhine, near which are mines of silver and lead; four miles N.W. of Colmar.

MARIE du Mont, a town of France, in the department of the Channel; four miles N. of Carentan.

MARIE, *Cape Dame*, the W. point of the island of St. Domingo, which, with Cape Nicholas, forms the entrance of the bay of Leogane. N. lat. $18^{\circ} 38'$. W. long. from

Paris $76^{\circ} 51'$. The town of this name, situated on the Cape, is on the N.W. part of the S. peninsula; 8 leagues W. of Jeremies, and 60 W. of Port au Prince.

MARIE, a town of Hindoostan, in Malwa; 12 miles E. of Seronge.

MARIEBOE, a town of Denmark, in the island of Lælland, situated near a lake abounding in fish; 12 miles E. of Næfow. N. lat. $54^{\circ} 51'$. E. long. $11^{\circ} 32'$.

MARIEFRED, a town of Sweden, in the province of Sudermanland, on a bay of the Mælær lake; 25 miles W. of Stockholm.

MARIE-GALANTE, an island in the West Indies, discovered by Columbus in the year 1493, of a circular figure and about 42 miles in circumference. It was first settled by the French in 1647; and has since been taken by the Dutch and by the English, but restored to the French by the English in 1763. This island affords a considerable quantity of tobacco; and contains many grottoes in which are found large crabs, and also several rivers as well as ponds of fresh water. It is flat on the western shore, and the soil is fit for cultivation. At the time of its last reduction by the English the annual manufacture of sugar amounted to 1000 hogsheds. N. lat. 16° . W. long. $61^{\circ} 6'$.

MARIENBERG, a town of Saxony, in the circle of Erzgebirg, which has in its vicinity mines of silver, cobalt, iron, vitriol and sulphur. It has a manufacture of fine lace, and a medicinal bath; 34 miles S.W. of Dresden. N. lat. $50^{\circ} 36'$. E. long. $13^{\circ} 6'$.

MARIENBURG, a town of Russia, in the government of Riga; 28 miles S. of Verro.—Also, a town of Transylvania, called also *Foldmar*; six miles N. of Cronstadt. N. lat. $46^{\circ} 2'$. E. long. $45^{\circ} 14'$.—Also, a town of Prussia, denominated also *Mallorg*, which is the capital of a prefecture situated on the Viltula. It was formerly the chief place belonging to the Teutonic knights. It was once and again taken by the Swedes; 24 miles S.E. of Dantzic. N. lat. $54^{\circ} 3'$. E. long. $18^{\circ} 55'$.—Also, a town of the bishopric of Hildesheim; five miles S.E. of Hildesheim.

MARIENFELD, a town of Germany, in the bishopric of Munster; 11 miles E. of Warendorf.

MARIENGAUL, a town and lake of Russia, in the government of Polotsk; 40 miles N.E. of Rezitza.

MARIENHAVE, a town of East Friedland; nine miles N. of Embden.

MARIENSTERN, a town of Upper Lusatia; nine miles W. of Budissen.

MARIENWALDE, a town of Brandenburg, in the New Mark; six miles N.W. of Woldenberg.

MARIENWERDER, a town of Prussia, in the province of Oberland, situated on the small river called the *Leibe*, not far from the Viltula. This town, which was first built in the year 1233 on a werder, or small island, called "Quidzin," but soon after rebuilt in its present situation, was occupied by some grand masters of the Teutonic order. The cathedral, erected in the 13th century, is the largest church in the kingdom of Prussia, and seems by its strong breast-works to have been intended for a fortress. The palace is a spacious edifice, constructed in the Gothic style, and is surrounded by a pleasant country of varied surface. The inhabitants of this town carry on a considerable trade with their neighbours. It has been often damaged by inundations, fire, and war. The famous league formed against the knights of the Teutonic order was concluded here in 1440; 35 miles S. of Dantzic. N. lat. $53^{\circ} 43'$. E. long. $18^{\circ} 42'$.

MARIEN-

MARIENZELL, a town with a convent in the archduchy of Austria; the convent has a celebrated image of the Virgin; six miles W.S.W. of Baden.

MARIES, ST., LA, a town of France, in the department of the Mouths of the Rhone, on an island formed by the divided stream of the Rhone, near the sea; 16 miles S. of Arles. N. lat. $43^{\circ} 27'$. E. long. $5^{\circ} 31'$.

MARIES, *Three*, three desert islands in the Pacific ocean, near the west coast of Mexico; the largest of which is about 21 miles in circumference. They abound in hares, guanoes, pigeons, &c., and the coasts with turtles and fish. N. lat. $21^{\circ} 30'$.

MARIESTADT, a town of Sweden, in West Gothland, built by Charles IX. on the rivulet Tidla, where it falls into the Wenner lake. The houses are mostly built of wood, and painted of a red colour; 80 miles N.E. of Gotheborg. N. lat. $58^{\circ} 27'$. E. long. $13^{\circ} 38'$.

MARIETTA, a town of America, in the state of Ohio and county of Washington, situated at the confluence of the Muskingum with the Ohio. It is laid out, on a delightful plain formed by the banks of the two rivers, into 1000 house-lots, with 90 feet in front by 180 feet in the rear, with suitable open squares, reserved for use, ornament and pleasure. Its streets intersect one another at right angles. It derives its name from Marie Antoniette, the late queen of France, and was settled in April 1788, and incorporated in 1800. In 1803 it contained 550 inhabitants and 91 dwelling-houses, besides eight merchants' stores, 19 buildings occupied by public officers and mechanics, three rope walks, a gaol, a court-house, and an academy used as a place of worship. This town is rapidly increasing in population, wealth, and elegance. Its situation is delightful; it is environed by high hills, some of which are covered with trees, and others afford excellent stone for building. The vales and lower grounds are extensive and very fertile. Within the limits of the town are those ancient forts, on the bank of the Muskingum, which have furnished the curious with subjects of diligent investigation. N. lat. $39^{\circ} 25'$. W. long. $81^{\circ} 30'$. Harris's Tour.

MARIGNANO, a town of Italy, in the department of the Olona; 11 miles S.E. of Milan.

MARIGNIA, in *Botany*, a name given by Commerçon to a sort of bastard rosin tree, of the Mauritius, which Jussieu reduces to *Bursera*, though it has five petals and ten stamens, with a coriaceous, not pulpy, fruit. See *BURSERIA*.

MARIGNY, in *Geography*, a town of France, in the department of the Channel, and chief place of a canton, in the district of St. Lô; six miles W. of St. Lô. The place contains 1260, and the canton 7918 inhabitants, on a territory of $102\frac{1}{2}$ kilometres, in 12 communes.—Also, a town of France, in the department of the Indre and Loire; 15 miles S.W. of Chinon.—Also, a town of France, in the department of Mont Blanc; 20 miles S.S.E. of Geneva.

MARIGONDON, a town situated on the W. coast of the island of Luçon. N. lat. $13^{\circ} 8'$. E. long. $123^{\circ} 20'$.

MARIGOT, a town of the island of Martinique; nine miles N.W. of Cul de Sac de la Trinité.

MARIHABAG, a town on the E. coast of Mindanao. N. lat. $8^{\circ} 48'$. E. long. $126^{\circ} 12'$.

MARIKINA, in *Zoology*, the name given by Buffon to the *SIMIA Rofalia*; which see.

MARILA, in *Botany*, Swartz. Prod. 84. Schreb. 806. Mart. Mill. Dict. v. 3. This genus, consisting of a single species only, *M. racemosa*, a West Indian shrub, was adopted by Swartz from the manuscripts of Solander. The name

seems taken from $\mu\alpha\rho\iota\lambda\alpha$, *live embers* or *sparks*; but we cannot tell whether it alludes to the "elegantly transparent" dots and lines in the foliage, or to the sparkling yellow pellicle and fringe which is said to accompany the seeds. We are most inclined to suppose the former; but the matter is of little importance, as this genus is reduced by Dr. Swartz himself, in his Fl. Ind. Occid. 963, to the *Bonnetia* of Schreber, which is Aublet's *Mahurea palustris*. We think it not advisable to change the specific name of this last, to the far less eligible one of *meridionalis*, though the other species is likewise found in wet situations.

BONNETIA being omitted in its proper place, we subjoin its characters. This genus was so called by Schreber, in honour of the celebrated Charles Bonnet of Geneva, who died in 1793, aged 73, and who has distinguished himself by various physiological and speculative works in natural history. His enquiries concerning the use of leaves entitle him to botanical commemoration, though he was no adept in the practical or systematic departments of the science. Schreb. 363. Willd. Sp. Pl. v. 2. 1213. Mart. Mill. Dict. v. 1. Swartz Ind. Occ. 963. (Marila, as above. Mahurea, see that article.) Clafs and order, *Polyandria Monogynia*. Nat. Ord. *Columnifera*, Swartz; uncertain, Juss.

Gen. Ch. Cal. Perianth inferior, of five oblong, concave, rather unequal leaves. Cor. Petals five, ovate, obtuse, concave, longer than the calyx, two of them rather larger and more spreading than the rest. Stam. Filaments very numerous, inserted into the receptacle, shorter than the corolla, thread-shaped, a little dilated upwards; anthers oblong. Pist. Germen superior, oblong; style thickish, incurved, the length of the germen; stigma obtuse, somewhat capitate. Peric. Capsule oblong, columnar, of three or four cells, and three or four acute valves, whose inflexed margins are inserted into the angles of the central column. Seeds very numerous, imbricated, minute, oblong, each enveloped in a fringed coloured membranous tunic.

Ess. Ch. Calyx of five leaves. Petals five. Capsule superior, of three or four valves, and as many cells. Seeds numerous, imbricated, each in a membranous coloured tunic.

1. *B. palustris*. Vahl. Eclog. v. 2. 42. (*B. meridionalis*; Sw. Ind. Occ. 967. *Mahurea palustris*; Aubl. Guian. v. 1. 558. t. 222.)—Leaves alternate Clusters terminal.—Native of marshes in Cayenne and Guiana, flowering in August, and bearing fruit in October. A tree of moderate size, with a soft white wood. Leaves alternate, stalked, oval, three or four inches long, entire, smooth, veiny. Flowers racemose, purplish.

2. *B. racemosa*. Swartz Ind. Occ. 965. (*Marila racemosa*; Prod. 84.)—Leaves opposite. Clusters axillary.—Native of the banks of rivers in the West Indies. A tall shrub, with many stems. Leaves eight or ten inches long, lanceolate, acute, finely veined, and full of pellucid dots and lines, which are beautifully conspicuous when seen against the light. Footstalks half an inch long. Stipules none. Flowers greenish-white, in simple axillary clusters, half as long as the leaves. Petals very short-lived. Capsule an inch long.

MARILHOSA, in *Geography*, a town of Portugal, in the province of Alentejo; 18 miles E.N.E. of Mourao.

MARIM, a river of Brazil, which discharges itself into the Atlantic, S. lat. $2^{\circ} 25'$. W. long. $44^{\circ} 46'$.

MARIMATA, a town of Arabia, in the province of Oman; 90 miles S.W. of Maskat.

MARIN FABRICE, in *Biography*, a French composer, who set the songs of Ronfard, Baif, Jamier, and Desperthes, in

in four parts, which were printed and published at Paris in 1578, by Adrian le Roy.

MARIN, *Monsieur, ci-devant compte*, a great dilettante musician, and a performer on the Pedal-harp, in the most singular and masterly style, perhaps, at which any other performer on that instrument ever arrived. His modulation, passages, and strokes of genius in the music which he plays, whether written or extempore, seem the effusions of a bard inspired;

“Who with a master’s hand and prophet’s fire,
Strikes the majestic concords of his lyre.”

The whole of his performance is unlike any other music but the voluntaries of a great organist. It can only therefore be truly enjoyed by masters and deep musicians. It may surprize, but cannot delight the public. It is not so amiable, or indeed so fit, for a female to attempt as the exquisite performance of madame Krumpholtz. But it shews the extent of the instrument’s powers, as well as the performer’s abilities, greatly to surpass whatever was heard before, or thought possible for genius and diligence to attain.

M. Marin, we believe, was the first who accompanied his élèves on the same instrument, after the manner of a duet on one piano-forte, by standing behind them and picking out notes in such parts of the clavier as are unoccupied by the principal performer. This expedient was not put in practice for want of abilities to accompany them on any other instrument; as, if he was not superior to all other performers on the harp, he would be called an exquisite player on the violin, upon which instrument, though many may exceed him in execution, there are very few that are equal to him in expression. Almost every year produces a musical phenomenon of some kind or other; and M. Marin was certainly the phenomenon of his time among harpists wherever he went.

MARIN, in *Geography*, a small island of Russia, in the Baltic; 72 miles N. of Riga. N. lat. 58° 10'. E. long. 24°.

MARINA, a town of Africa, in Kaarta; 15 miles N. of Kemmoo.—Also, a town of the island of Cyprus, on the S. coast; four miles S. of Larnica.

MARINDUGERA, or MARINDIQUE, one of the Philippine islands, near the S. coast of Luçon, about 60 miles in circumference; 30 miles N.E. of Mindoro. N. lat. 13° 29'. E. long. 12° 51'.

MARINE CHAIR, is a contrivance of Mr. Irwin, for facilitating the necessary observations, in order to determine the longitude at sea. It is said that Mr. Irwin, on a trial of this machine, found the longitude within twenty-three miles, or about one-third of a degree. See LONGITUDE.

MARINE *Clothing Room*, in a *Ship*, an apartment built in the after platform on the larboard side, to receive the clothing used by the marines.

MARINE *Insurances*. See MARINE INSURANCES.

MARINE *Law*. See LAW.

MARINE *Remains*, a term used by many authors to express the shells of sea-fishes, and parts of crustaceous and other sea-animals, found in digging at great depths in the earth, or on the tops of high mountains. Their being lodged in these places, is an evident and unquestionable proof of the sea’s having once been there, since it must have covered those places where it has left its productions. It has been a favourite system with many, and particularly with the late Dr. Woodward, that all these marine bodies were brought to the places where they now lie, by the waters of the universal deluge; which, as we are informed by holy writ, covered the whole surface of the globe, and even the highest

mountains. (See DELUGE.) But though this is a very ready expedient to account for many of the natural phenomena, yet there are evident proofs that it cannot have been the cause of all that is attributed to it; and there must necessarily have been some other cause of many of these remains having been placed where we now find them. Neither does the opinion of some particular authors, that partial inundations of different places have left these marine bodies behind them at the recesses of the waters, seem sufficient to account for the multitudes of these remains, many of which we find thrown upon places inaccessible to such floods. Moro, de Crustaceis in Montib. deprehens.

Signior Moro has attempted to account for these phenomena on a new plan of reasoning. He observes that it is the best basis of argument to begin from facts: and that if we can certainly find how some part of these animal remains come to be deposited at such great distances from their natural residence, we may very rationally conclude, that by the same means, be they what they will, all the rest were also brought thither. He adds, that the earth, once the bottom of the sea, or the level surface of a plain, may be, and frequently has been, in the memory of man, raised up into a mountain by subterranean fires, earthquakes, and volcanoes. He mentions the famous instance of the new island raised out of the bottom of the sea near Santorini in the year 1707, which became of a circumference not less than six miles, and of the new mountain raised near Puzzoli in 1538.

These, and many other like facts, prove that the origin of mountains and islands may have been such, and that the matter they consist of may have been the same with what was once the bottom of the sea; and that the marine bodies found in these mountains, were such as were living, or remaining of living fish at the time when the island or mountain were so raised above the surface of the water which before covered it.

This is no new opinion; but this author has set it in a new and much stronger light than ever it had appeared in before, by the instances and examples he has brought in proof of it. Some have been fond of believing that the bodies we call marine remains, were never indeed any parts of living animals, but that they are merely *lusi naturæ* formed in the places where they are found; but Fabius Columna proved this to be an error, shewing that the shark’s teeth, or glossopetrae of the island of Malta, when calcined by a strong fire, yielded ashes the same with those from animal bodies, and by no means of the same nature with those produced from calcined stones.

That changes of parts of the bottom of the sea into dry land, have often been made, is proved not only from the late known instances, but from the testimonies of Strabo, Pliny, and other writers of credit: and nothing is more obvious to reason, than that in the sudden rise of such parts of the bottom of the sea, all its contents, all the shells, and other hard parts of fishes lying there, would be carried up with it.

As some mountains and some islands must have certainly been produced in this manner, it is not impossible but that all of them may have been so; and there is no more than this required to account clearly and evidently for all the vast profusion of marine bodies at land as we find them, without having recourse to the improbable means of the universal deluge, which, for many plain reasons, cannot have been the cause; or to the effects of particular inundations, which must have been wholly incapable of lodging many of them there. The lodging of shells in the solid strata of mountains, is better accounted for by this system of signior Moro than any other; and if it be asked why some mountains afford them in great

plenty, and others not at all, it will be not difficult to answer, by observing, that among the mountains of the more known parts of the world, some consist of mere solid rock, and others of various strata of earthy and other matter; that the first of these may be supposed primary or natural mountains, and the other secondary or accidental ones: and that these marine remains are always wanting in the former, and usually are found in the latter, which is a fact greatly favourable to this system.

There are many difficulties attending the accounts of all authors of the formation of the earth, and the lodging of these bodies in it; nor is this last system without difficulty. The causes here assigned as to the origin of mountains and islands, doubtless have been so in regard to some, but scarcely to all; and the bodies here treated of are so numerous, in some particular places, that scarcely any account can solve the difficulty of their being collected together in so strange a manner. See *Adventitious Fossils*, and *Theory of the EARTH*.

MARINE Salt. See SALT.

MARINE Surveyor, is the name of a machine contrived by Mr. H. de Saumarez, for measuring the way of a ship in the sea. This machine is in the form of the letter Y, and is made of iron or any other metal. At each end of the lines which constitute the angle or upper part of that letter, are two pallets, not much unlike the figure of the log; one of which falls in the same proportion as the other riles. The falling or pendent pallet meeting a resistance from the water, as the ship moves, has, by that means, a circular motion under water, which is faster or slower, according as the vessel moves. This motion is communicated to a dial within the ship, by means of a rope fastened to the tail of the Y, and carried to the dial. The motion being thus communicated to the dial, which has a bell in it, it strikes exactly the number of geometrical paces, miles, or leagues, which the ship has run. Thus the ship's distance is attained; and the forces of tides and currents may also be discovered by this instrument; which, however, has been very little used. See a large account of it in the *Abr. Phil. Trans.* vol. vi. p. 444, &c.

MARINES, in *Geography*, a town of France, in the department of the Seine and Oise, and chief place of a canton, in the district of Pontoise; seven miles N.W. of Pontoise. The place contains 1232, and the canton 13,814 inhabitants, on a territory of 295 kilometres, in 39 communes.

MARINES, or *Marine Forces*, a body of troops employed in the sea-service, under the direction of the lords of the admiralty. These marines compose certain regiments trained to the different modes of sea-fighting, and made useful also in some of those manœuvres of a ship, where a great number of hands is required. The precise time when this institution first took place, is, like many other parts of military history, involved in obscurity. The oldest corps of this kind, which Grose has been able to discover, was the third regiment of infantry in the list of the army for the year 1684. It then consisted of 12 companies, without grenadiers. The men were clothed in yellow coats, lined with red; their colours were a red cross, with rays of the sun issuing from each of its angles. This was not the present third regiment, now distinguished by the name of the old buff, which then stood the fourth on the list. In the reign of king William III. there were several marine regiments. In the beginning of the reign of queen Anne six regiments of marines were raised: these regiments have been very useful, more especially upon fitting out squadrons of ships for an immediate expedition; for as they are constantly quartered, when

not at sea, as near the principal ports as possible, *viz.* Plymouth, Portsmouth, and Chatham, they were very easily put on board such ships as had most occasion for them: for they were under the immediate direction of the admiralty: and rules and instructions for their better government were settled by his majesty in council, July 1, 1702. In the war preceding the peace of 1748 there were 10 regiments of marines, which were disbanded about the year 1749: these were under the direction of the lords of the admiralty, and when ashore were quartered in the neighbourhood of the docks and sea-ports. In 1755 a number of companies of marines were raised, under the direction of the secretary of war; they were afterwards formed into three divisions, and stationed at the towns of Plymouth, Portsmouth, and Chatham; and at each of these places have now convenient barracks. These companies, A. D. 1761, being 130 in number, were, from the time of their establishment, put under the immediate direction of the lords of the admiralty. At the peace many of them were reduced; and in 1770 there remained only 70 companies; but in the year 1782, they were increased to 150. The marines are clothed and armed in the same manner as his majesty's other corps of infantry. Their uniform is scarlet, faced with white, white linings, waist-coats and breeches; they also wear caps, like those of the fusileer regiments. Their pay is the same with that of the marching regiments of foot. There are annual acts for the better governing of his majesty's royal marine forces whilst on shore; which are much the same with those that respect the land-forces, only with some variations on account of their being subject to the jurisdiction of the admiralty. Thus, the lord high admiral, or three commissioners of the admiralty, are to form articles of war, and grant commissions for holding courts-martials. Notice of a deserter being apprehended is to be sent to the secretary of the admiralty. The billeting, and carriages, are to be in pursuance of orders from the admiralty.

MARINER, the same with seaman or sailor.

The mariners of a ship are accountable to the master; the master to the owners; and the owners to the merchant, for all damages by negligence, or otherwise. If a mariner be hired, and he deserts the service before the voyage is ended, by the law marine, and by common law, he shall lose his wages; and if a ship is lost by tempest, &c. the mariners lose their wages, as well as the owners their freight; and this is to oblige them to use their utmost endeavours to preserve the ship.

Personating mariners, and receiving their wages, and forging letters of attorney, &c. or falsely taking out letters of administration for the receipt of seamen's wages, is felony without benefit of clergy. See FORGERY and *Greenwich Hospital*.

Concerning seamen in the merchant service, it is enacted by 2 Geo. II. c. 36. that no master of a ship shall proceed on a voyage, without agreeing in writing with such mariner (apprentices excepted), to be signed by such mariner, for wages; and by 31 Geo. III. c. 39. the same is extended to seamen employed in the coasting trade, on pain of 5*l.* for each mariner, on conviction before one justice, by the oath of one witness, to be levied by distress. (See also 37 Geo. III. c. 73.) If the mariner desert after he hath signed the agreement, he shall forfeit the wages due to him at the time of deserting; and on application from the master, owner, or commander of the ship, such justice may cause him to be apprehended; and if he shall refuse to proceed on the voyage, without sufficient reason to the satisfaction of the justice, the said justice shall commit him to the house of correction, for not exceeding 30 nor less than 14 days. (2 Geo. II. c. 36.

c. 36. 31 Geo. III. c. 39. 45 Geo. III. c. 31.) For forfeitures to *Greenwich Hospital*, and privilege of admission, see that article. The master of the ship shall pay the seaman's wages, if demanded, in 30 days after the ship is entered in the custom-house, or at the time of discharge, which shall first happen, deducting out of such wages the aforesaid forfeiture; on pain of 20*s.* to such seaman, to be recovered in like manner as his wages. (2 Geo. II. c. 36. 31 Geo. III. c. 39.) By 44 Geo. III. c. 13. it is enacted that petty officers or seamen, arrested by sheriffs or other officers, shall be kept in custody after being entitled to a discharge from any process; and be conveyed to the commander-in-chief, or some commissioned officer, to serve on board his majesty's fleet. And the sheriff, gaoler, or other officer, shall be paid by the treasurer of the navy, upon producing a certificate for conducting such seaman at the rate of 2*s.* per mile. The transfer of such seaman shall be certified upon the back of the process. If any sheriff, &c. shall neglect so to convey such seaman, he shall be liable to an action of trespass at the suit of such petty officer, &c. or seaman. If any sheriff, &c. shall suffer any such seaman, &c. to escape, he shall be liable to the penalty of 100*l.* recoverable in any of the courts of record at Westminster; one moiety to the king, and the other to the party suing. Any action by virtue of this act, must be brought within three months after the suit; and if the plaintiff fail in such action, the defendant shall have treble costs. By 37 Geo. III. c. 73. to prevent the desertion of seamen from merchant ships, every seaman who shall desert during the voyage, either out or home, from any British merchant ship, trading to or from his majesty's colonies in the West Indies, shall, over and above all punishment, penalties, and forfeitures, to which he is now subject, forfeit all the wages he may be entitled to from the master or owner of the ship, on board of which he shall enter immediately after such desertion. And every master or commander of any ship, who shall engage any such person, knowing him to have deserted from any other ship, shall forfeit 100*l.* In the act above cited there are several other provisions and regulations relating to seamen in the merchant service. By 35 Geo. III. c. 28. c. 95. petty officers, seamen, boatswain, gunners, &c. may allot a certain part of their monthly pay for the maintenance of wives and children, or mothers. And by 37 Geo. III. c. 53. an increase of wages is made to such persons, and they are empowered to allot a part of such pay, to be calculated as nearly as may be to equal one half of it. All petty officers, seamen, marines, &c. who may be wounded in action with the enemy, shall receive their full wages until their wounds are healed; or until (being declared incurable) they shall receive a pension from the chest at Chatham, or be admitted into Greenwich hospital. (See also 46 Geo. III. c. 127.) All allotments of wages are to be paid without deductions, on penalty of 20*l.*

Mariners wandering up and down, and who shall not settle themselves to work, or have not a testimonial under the hand of a justice, shewing where they landed, and whither to go, &c. or having such testimonial, if they exceed the time limited more than fourteen days, not being sick in their passage home, &c. are guilty of felony by 39 Eliz. cap. 17. This sanguinary law, though in practice deservedly antiquated, still remains a disgrace to our statute-book; yet attended with this mitigation, that the offender may be delivered, if any honest freeholder, or other person of substance, will take him into his service, and he abides in the same for one year; unless licensed to depart by his employer, who, in such case, shall forfeit 10*l.* But if they cannot work, for want thereof, the two next justices, upon

their complaint, shall take order that they may be provided of work; or otherwise may tax the whole hundred, till relief shall be had. (Stat. *ibid.*) And every parish may be charged for relieving mariners, as for maimed soldiers; and they shall be relieved by the treasurer of the county, &c. (43 Eliz. cap. 3.) The probate of the will, or letters of administration, of any common soldier, or seaman, who shall be slain or die in the service, shall be exempted from the stamp duties; a certificate being produced from the captain under whom he served, at the time of his death, and oath made of the truth thereof, before the proper judge or officer, for which oath no fee shall be taken. 5 Will. c. 21.

In order to facilitate the returns of marines and sailors, as well as soldiers, when discharged, to their respective places of legal settlement in England, and to prevent their being deemed rogues and vagabonds, and punished as vagrants, it is provided by the 43 Geo. III. c. 61, that, carrying their discharge, within three days from its date, to the mayor or chief magistrate of the city, town, port, or corporate place nearest to, or within 15 miles from, the place of their discharge, they shall receive from such magistrate a certificate stating the place to which the persons so discharged are desirous of going, being their home or legal place of settlement, together with the time to be fixed, not exceeding ten days for every 100 miles, and so in proportion, except for a reasonable cause to be expressed in such certificate; and such person producing such discharge and such certificate, when lawfully demanded, and being in his route accordingly as to time and road, shall not, by reason of asking relief, be deemed to be a rogue or vagabond; provided such discharge bear the true date, both as to the time when, and place where it was given, and shall express the sum or sums, if any, which were paid to such soldier or sailor at such time and place. New certificates are to be affixed to the former in case of delay from accident or sickness. And all certificates or passes granted as heretofore from the office of admiralty, or war-office, to discharged sailors, soldiers, or marines, or to the families of such, serving abroad, or lately deceased, to carry them to their respective homes, shall have the same effect and force to all intents and purposes whatsoever as the certificates herein permitted to be given by the magistrate as aforesaid; and the terms of the same may be extended, &c.

By the 22 Geo. II. c. 44. all officers, marines, and soldiers, who have been employed in his majesty's service, and not deserted, may set up and exercise such trades as they are fit for in any town or place within Great Britain or Ireland, (except Oxford and Cambridge), and if they shall be sued thereupon they shall have double costs.

By 31 Geo. II. cap. 10. no seaman aboard his majesty's ship can be arrested for any debt, unless the same be sworn to amount to at least 20*l.*

The method of ordering seamen in the royal fleet, and keeping up a regular discipline there, is directed by certain express rules, articles, and orders, first enacted by the authority of parliament, soon after the Restoration (13 Car. II. stat. 1. cap. 9.); but since new-modelled and altered, after the peace of Aix-la-Chapelle, (22 Geo. II. cap. 23, amended by 19 Geo. III. c. 17.) to remedy some defects, which were of fatal consequence in conducting the preceding war. In these articles of the navy, almost every possible offence is set down, and the punishment thereof annexed: in which respect the seamen have much the advantage over their brethren in the land-service; whose articles of war are not enacted by parliament, but framed from time to time at the pleasure of the crown. For these articles, see NAVY.

MARINERS'-Compass. See COMPASS.

MARING, in *Geography*, a town of Prussia, in the province of Ermeland; 10 miles W.S.W. of Allenstein.

MARINGANDO, a town on the W. coast of Madagascar. S. lat. 13° 50'. E. long. 48° 30'.

MARINGUES, a town of France, in the department of the Puy-de-Dôme, and chief place of a canton, in the district of Thiers; 14 miles N.W. of Clermont. The place contains 3800, and the canton 7586 inhabitants, on a territory of 82½ kilometres, in four communes.

MARINHA, *St.*, a town of Portugal, in the province of Beira; 23 miles S.E. of Oporto.

MARINI, GIAMBATTISTA, in *Biography*, known generally by the name of *Il Cavaliere Marini*, an Italian poet, was born at Naples in 1569. His father was a counsellor of eminence, and was desirous of bringing up the young man to his own profession, but was unable to overcome the repugnance to legal studies, which an early attachment to poetry produced in him, as it has done in so many others. His father would not be appeased at the disappointment which he felt in the son's refusal to acquiesce in his wishes, and expelled him from his house. For a short time he obtained an asylum with a person of rank, till a juvenile misdemeanor caused him to be committed to prison. On recovering his liberty, he went to Rome, and was introduced to cardinal Peter Aldobrandini, with whom he lived some years, and whom he accompanied to Ravenna and Turin. At the last city he rendered himself conspicuous by his talents and learned warfare with several literary antagonists; of these, the one most noted was Gaspar Murtola, a Genoese, who, jealous of Marini's reputation, and of his having been honoured with knighthood, attacked him in sonnets and lampoons. Marini was not behind hand in taking his revenge, and was so severe in his "Murtoleide," that the enraged poet attempted to assassinate him in the streets of Turin: he missed his rival, and wounded a favourite of the duke, who stood by his side. For this act Murtola would have been hanged, had not Marini interceded with the duke for his life. After this, Marini's enemies gained the advantage over him, and obtained an order for his imprisonment. Upon his liberation, he went to France in 1615, whither he had been invited by queen Margaret. Before he arrived, his patroness was dead, but he met with a steady friend in queen Mary of Medicis, who settled upon him a liberal pension. In France, he published his most famous poem, the "Adone," first printed in 1623. He returned to Rome, and was elected president of the academy *Degli Umoristi*. He afterwards went to Naples, where he was favourably received by the viceroy, duke of Alva. He died in 1625, at the age of fifty-six. Besides his "Adone," of which there were many editions, he published, among many other things, "La Strage degli Innocenti;" "La Sampogna;" and a collection of "Letters." He had a lively imagination, and very fertile invention; but is not celebrated for a good taste; and many of his pieces contain licentious passages, which, however, when he was near his end, he begged might be expunged in all future editions; but they were too much in the taste of the age for such a sacrifice. Moreri.

MARINI, in *Geography*, a town of Spain, in New Castile; 4 miles N.W. of Alarçon.

MARINO, *St.*, a small republic of Italy, near the coast of the Adriatic sea, between Romagna and Urbino, in N. lat. 43° 55'; the territory of which is confined to a mountain, with a diminutive tract at the foot of it. The number of inhabitants is estimated at between five and six thousand; and it has been their happy lot to enjoy freedom and tranquillity for more than thirteen centuries with little inter-

ruption. Surrounded by the dominions of the pope, they have claimed his protection. The founder of this considerable state was St. Marino, a Dalmatian by birth, and a mason by trade. Having finished some repairs of Rimini, in the ninth century, he retired to this sequestered mountain, where he led the life of a hermit, and subjected himself to all the austerities of religion. The princes of the country, it is said, observing his extraordinary sanctity, made him a present of the mountain; and a number of inhabitants resorting hither, he established the republic that has ever since been distinguished by his name. Their whole history is comprised in two purchases made of a neighbouring prince, one the castle of Pennuenta in 1100, and another, called Casala, in 1170, and in the assistance afforded to the pope, Pius II., about 290 years after against Malatesta, lord of Rimini. In return for this service he transferred to them four small castles, together with the village of Piagge. This was the epocha of its highest grandeur, but now it is reduced to its primary limits. In 1739, the miserable ambition of cardinal Alberoni, disappointed in considerable projects and embroiling larger states, was directed against this republic, and he subjected it to the see of Rome; but on complaints of its council, the pope restored to it its former freedom and privileges. The government of this state consists of a council of 40, half nobles and half commoners. On very important occasions an arengo, or great council, is convened, to which every family has the privilege of deputing a representative. The principal officers are two captains, who are changed every half year; a commissioner, who is a foreigner, and who tries civil and criminal causes; a doctor of laws, whose office is triennial; and a physician, who must be a foreigner, and who is chosen for three years to attend the sick, and to inspect the shops of apothecaries. In this republic are three castles, three convents, and five churches.

MARINO, *St.*, the capital of the above described republic, which is an indifferently built town or rather a village, situated on a rugged hill of difficult access, formerly called "Mons Sacer," and well fortified, with only one avenue to it; 10 miles S.W. of Rimini, and as far from the sea-coast. N. lat. 42° 56'. E. long. 12° 24'.—Also, a town of Naples, in *Basilicata*; 9 miles S. of Turfi.

MARINONI, JOHN JAMES, in *Biography*, a celebrated mathematician and astronomer, was born at Udina, in the Frioul, in 1676. He made a rapid progress in his education, outstript his contemporaries, and shewed a decided turn for mathematical studies. In 1696, he repaired to the university of Vienna, and obtained the degree of doctor in philosophy. He was soon after this appointed by the emperor Leopold mathematician to the court: in which capacity he fortified the city so as completely to prevent the incursions of the rebels, and to put a stop likewise to the practice of smuggling, which at that time prevailed. After the death of the emperor, he was taken under the protection of his successor; and by his orders, in 1706, made a survey of the capital, and its environs, which was engraved, the same year, in four large sheets. In 1709, Marinoni was appointed engineer of Lower Austria: in 1714 he invented an instrument for measuring superficies in an easy manner, and without the necessity of calculation. This instrument he called the planimetric balance, and he dedicated the work, in which its principles were explained and illustrated, to the emperor Charles VI., which, however, was never printed. In 1717, he formed a plan for the establishment of an academy destined to teach geometry and the military sciences, which, being approved by the emperor, was immediately carried into execution, and in the following year Marinoni was appointed

sub-

sub-director of the new establishment, and in 1719 he received a patent as first mathematician to his majesty, and in that quality he was sent to the Milanese to make a survey of the duchy: a labour on which he was employed three years, and which he accomplished to the satisfaction of his sovereign. In 1726, he was admitted into the class of the nobility of the empire, and appointed chief director of the military of the academy. Owing to some disputes respecting the limits of the different states in consequence of changes which had taken place in the courses of the rivers, Marinoni was requested, in 1729, as well by his imperial majesty, as by several Italian princes, to resume the discussions entered into on that subject, with the view of bringing them to a conclusion. This undertaking, which required very fine talents, in order to reconcile a multitude of complex interests, Marinoni completed to the perfect satisfaction of every person concerned. In 1730, he established what he called "Specula Domestica," causing all the instruments that he intended to use to be constructed under his own inspection: he was accustomed to construct every thing he used, and kept in constant employment, in his own premises, artificers of almost every kind, as printers, engravers, book-binders, &c. By this mode of conduct, he was enabled to form one of the most complete observatories in Europe, and he made observations which may be placed in the same class with those of the ablest astronomers. In 1745 he published, and presented to the son of Charles VI., a very magnificent work, entitled "De Specula Domestica." In the following year he was elected a member of the Royal Academy of Sciences at Berlin, on the recommendation of Maupertuis, then president; and in 1751, he published a new work, entitled "De Re Ichnographica." He intended to have proceeded with other works which he had planned for himself, but death put a close to his labours. He died on the 10th of January, 1755. He left behind him thirty-six volumes of astronomical observations arranged in the best order. He is said, during the last twenty years of his life, to have lost scarcely a moment of his time. He bequeathed his astronomical instruments to the empress-queen, who accepted the legacy, and to render it of the greatest utility, presented it to the university. Gen. Biog.

MARINUM, in *Ancient Geography*, a town of Italy, placed by Strabo in Umbria.

MARIO, in *Ichthyology*, a name given by Pliny, and other of the old Roman authors, to a large fish allied to the acipenser or sturgeon. There seems from all that they have said of it, great reason to believe that it was the fish we at present call *huso*, or the ichthyocolla-fish, from its glass being made of it. Ardei makes this a species of the acipenser or sturgeon, and distinguishes it by the name of the acipenser without tubercles.

MARION, in *Geography*, a district of South Carolina, containing 6914 inhabitants, of whom 2155 are slaves.

MARION'S and *Crozet's Islands*, four islands of the Indian ocean, discovered by captains Marion and Crozet, French navigators, in the year 1772, and named by captain Cook in 1776. S. lat. 48°. E. long. 47°.

MARIOS, in *Ancient Geography*, a town of Laconia, N. of Geronthræ, pleasantly situated near a wood, and amidst fountains; and having in its vicinity a temple called Pantheon, from its being dedicated to all the gods. In the town was also a temple of Diana, in which were fountains.

MARIOTTE, EDMÉ, in *Biography*, an eminent French philosopher who flourished about the middle of the 17th century, was a native of the province of Burgundy. He was brought up to the church, and obtained the priory of St. Martin sous Beaumé, at some distance from Dijon.

He was admitted a member of the French Academy of Sciences in 1666, and died in 1684. He was an excellent mathematician, and one of the earliest French philosophers who applied to experimental researches. His principal works are "A Treatise on the Shock or Collision of Bodies;" "An Essay on Physics;" "A Treatise on the Pressure and Motion of Fluids;" "New Discoveries relating to Vision;" "A Treatise on Levelling;" "A Treatise on the Motion of Pendulums," and "Experiments on Colours." He also communicated many curious and valuable papers to the academy, which were inserted in their Memoirs, from vol. i. to x. A collection of all his pieces was published at Leyden in 1717, in 2 vols. 4to.

MARIOUA, in *Geography*, a town of Brasil, on the Rio Negro; 125 miles W. of Fort Rio Negro.

MARJORAM, in *Botany and Gardening*. See ORGANUM.

MARJORAM, in the *Materia Medica*. The sweet marjoram has been thought to be the *Σαμψύρον* or Amaracus of the ancients. It has been long cultivated in our gardens, and is in frequent use for culinary purposes. The leaves and tops have a pleasant smell, and a moderately warm, aromatic bitterish taste. They yield their virtues both to aqueous and spirituous liquors by infusion, and to water in distillation; affording a considerable quantity of essential oil, amounting, according to Beaumé, to 15 ounces from 150 pounds of the recent plant. On being long kept this oil assumes a solid form. When carefully drawn it is of a pale yellow colour, and of a hot penetrating taste. This plant has been chiefly recommended in disorders of the head and nerves, in uterine obstructions and mucous discharges, proceeding from a laxity and debility of the solids, and a sluggish state of the juices, and in the humoral asthmas and catarrhs of old people. The powder of the leaves, their distilled water, and the essential oil properly diluted, are agreeable errhines, and accounted particularly useful in pituitous obstructions of the nostrils, and disorders of the olfactory organs. Its medicinal qualities agree with those of the wild marjoram; but being much more fragrant, it is deemed to be more cephalic, and better adapted to the complaints denominated nervous; it may, therefore, be employed with the same intentions as lavender. It is directed in the composition of the pulvis sternutatorius in the Pharmacopeias, with a view to the agreeable odour which it diffuses to the afarabacca, rather than to its errhine power, which is very considerable. In its recent state, it is said to have been successfully applied to scirrhus tumours of the breast. Lewis and Woodville.

The leaves and flowery tops of the common wild marjoram, which grows on dry chalky hills and gravelly grounds in several parts of England, and flowers in July and August, have an agreeable aromatic smell, and a pungent taste, approaching to that of the garden marjoram, and much resembling thyme; with which they appear to agree in medicinal virtue, being deemed emmenagogue, tonic, stomachic, &c.; effects which can only be ascribed to the aromatic and stimulant powers which all the herbs of this natural order seem to possess in common. Infusions of them are sometimes drank as tea, in weakness of the stomach, disorders of the breast, for promoting perspiration of the fluid secretions in general; they are sometimes used also in nervine and anti-rheumatic baths; and the powder of the dried herbs as an errhine. Distilled with water, they yield a moderate quantity of a very acrid, penetrating, essential oil, smelling strongly of the marjoram, but less agreeable than the herb itself; this oil is applied, on a little cotton, for easing the pains of carious teeth; and some-

times diluted and rubbed on the nostrils, or snuffed up the nose, for attenuating and evacuating mucous humours. The country people use the tops of the plants to dye purple. Lewis and Woodville.

The dittany of Crete, which is a species of *origanum*, is a very warm aromatic, of an agreeable smell, and hot biting taste: the leaves, which impart their virtues both to water and rectified spirit, tinging the former of a yellowish, and the latter of a greenish colour, have been chiefly recommended as emmenagogue, alexipharmic, and vulnerary. When distilled with water, if the quantity of dittany be large, there separates, says Neumann, a small portion of a yellowish essential oil, of a highly pungent aromatic taste and smell, and which congeals in the cold into the appearance of camphor. This sort was much valued among the ancients, and applauded by their poets.

Thus Virgil describes it:

“Hic Venus, indigno nati concussa dolore,
Dittamnū genitrix Cretæa carpit ab Idæ,
Puberibus caulem foliis, et flore constantem
Purpureo: non illa feris incognita capris
Gramina, cū tergo volucres hæfere sagittæ”

Æn. l. xii. 411.

It was esteemed a specific for wounds of arrows, which it drew out with wonderful ease, and according to them only grew in the island of Crete, and only in a little obscure corner of it, whence it obtained its name *dittamnus Creticus*. It still grows in that island. M. Tournefort, who was in Crete, describes the place where it grows, and says it flourishes there almost all the year.

This is a perennial plant, and though a native of stony grounds in Greece, and the island of Candy, bears the ordinary winters of our own climate. The shops are generally supplied from Italy with the leaves tied up in bundles, which are often damaged or decayed, and at best not superior to those of our own growth. Although rarely used at this day, this plant certainly possesses, in a very considerable degree, the stimulant and aromatic qualities which characterize this class of plants. Lewis and Woodville.

MARIOUT, in *Geography*, a town of Egypt, on the W. coast of Birk Mariout; 15 miles S.S.W. of Alexandria.

MARIPA, in *Botany*, a barbarous Caribbean name, adopted by Jussieu from Aublet, but, according to his own principles, retained only till the genus is either better established, or entirely set aside. Aubl. Guian. 230. Juss. 133. Lamarck Illustr. t. 110.—Class and order, *Pentandria Monogynia*. Nat. Ord. *Convolvuli*, Juss.

Gen. Ch. *Cal.* Perianth inferior, of one leaf, in five deep, roundish, concave segments, folding over each other. *Cor.* of one petal, tubular; tube twice as long as the calyx, dilated at the base, as well as at the mouth; limb in five equal, roundish, crenate, spreading lobes. *Stam.* Filaments five, short, thread-shaped, inserted into the lower part of the tube, opposite to the segments of the limb; anthers vertical, oblong, cloven at the base, of two cells, shorter than the limb. *Pist.* Germen superior, ovate; style thread-shaped, declining, longer than the corolla; stigma peltate, convex. *Peric.* Capsule? of two cells. *Seeds* two in each cell, erect, parallel, convex externally, angular on the inside.

Ess. Ch. Corolla tubular, its limb in five equal spreading segments. Anthers long, arrow-shaped. Stigma peltate, convex. Capsule? of two cells. Seeds in pairs, erect, parallel.

1. *M. scandens*. Aubl. Guian. t. 91.—Found by Au-

blet in Guiana, on the banks of the river Sinémari, eight leagues from its mouth, flowering in November. The stem is twining, somewhat woody, supporting itself, by means of tendrils, upon the neighbouring trees. Leaves alternate, stalked, ovate, entire, pointed, smooth, firm and shining, six inches long at most. Panicles terminal, branched and forked, with a pair of small ovate bractæ at each subdivision. Flowers white, about the size of the common White Jasmine.

MARIPIPI, in *Geography*, one of the smaller Philippine islands; 20 miles S.E. of Mabate.

MARIPONDY, a town of Hindoostan, in the Carnatic; 15 miles S.W. of Ongole.

MARIQUITA, a town of South America, in the viceroyalty of New Granada, and province of Santa Fé, formerly celebrated for the rich mines of gold in its vicinity; on the W. are those of the Becaneme, and San Juan de Cordova, bordering on those of Hervi, Malpaso, Guarino, and Puano; and on the E. the silver mines of St. Anna, Lojas, and Frias; the silver, however, being mingled with the purest gold, but of difficult separation. This city, which was formerly opulent, is reduced to 300 inhabitants, a decline owing to the failure of the mines, so that those who have been engaged in them are unaccustomed to other branches of industry. Quésada, the conqueror of New Granada, died at Mariquita in 1597, but his body has been removed to the cathedral of Santa Fé. This city is distant 80 miles S. of Santa Fé de Bogota. N. lat. 5° 16'. W. long. 74° 6'.

MARIS, in *Ichthyology*, a name given by Charleton and some others to a fish called by the generality of both the ancient and modern writers, *smaris*, and by some *leucomenides*, from its whitish colour, and its external resemblance to the fish called *manis* and *mena*; it is, like that fish, a species of the sparus; and is distinguished by having a black spot on each side, and the tail and belly-fins red. See SPARUS *Smaris*.

MARISCA, in *Surgery*, an excrescence near the anus, so named from its resemblance to a fig.

MARISCH, in *Geography*, a town of Moravia, in the circle of Prerau; 12 miles N. of Freyberg.

MARISCUS, in *Botany*, a Latin word used by Pliny for some kind of bulrush, and supposed to be derived from *mare*, the sea, near which the plant naturally grows. Haller adopted this name for the *Schoenus* of Linnaeus, because he thought the latter too near *Schinus*, and because it was merely the Greek synonym of *Juncus*. This last reason is futile, and set aside by innumerable examples. Gertner however follows Haller; but they have not been imitated. As the *Schoenus Mariscus* of Linnaeus is probably a good distinct genus, having only two stamens, and a drupa containing one seed, see Engl. Bot. t. 950, it is much to be wished that the name in question had been reserved for that genus. It is, nevertheless, now otherwise appropriated, by Vahl and Brown, whose peculiarly great authority in this tribe induces us, without hesitation, to concur with them. Vahl Enum. v. 2. 372. Brown Prod. Nov. Holl. v. 1. 218.—Class and order, *Triandria Monogynia*. Nat. Ord. *Calamaria*, Linn. *Cyperoidea*, Juss.

Gen. Ch. *Cal.* a glume of two unequal membranous valves, containing two or three florets. *Cor.* a single glume, ribbed, that of the lower floret embracing the base of the upper. *Stam.* Filaments three; anthers linear. *Pist.* Germen superior, angular; style three-cleft, deciduous; stigmas simple. *Seed* single, naked, triangular, without any bristles at its base.

Ess. Ch. Calyx of two valves, two or three-flowered. Glumes

Glumes of the corolla imbricated, ribbed. Style three-cleft, deciduous. Seed triangular, without bristles at its base.

Obf. Mr. Brown remarks that this genus differs from *Cyperus*, with which it agrees in habit, only in the fewness of its florets. Professor Vahl describes its habit thus.

“*Root* throwing out scyons. *Stems* erect, acutely triangular, somewhat bulbous at the base, leafy in their lower part. *Leaves* linear, differing in breadth in different species, keeled, sheathing and purple at the base, rough with minute ferratures at the edges and keel. *Involucral leaves* like the others. *Spikes* in a terminal umbel, one upon each stalk, with a sessile spike in the centre. *Spikelets* alternate, rather distant, cylindrical, imbricated. *Braçea* solitary at the base of each spike, gradually tapering upwards. Glumes of the corolla striated. *Receptacle* of the spikelets angular, toothed.”—The same author adds, that he has “separated the plants composing this genus from KYLLINGIA, (see that article and CYPERUS,) because their habit, as well as fructification, is different. The spikelets are round and awl-shaped, not ovate and compressed. The calyx does not contain a solitary floret, but at least two, for the most part three. The glumes of the corolla are disposed in a different manner, not being parallel, but one above the other, so that the lowermost includes the lower half, or thereabouts, of that above it, each glume being furnished with a pitil, as may readily be perceived, even in dried specimens. While the lower glume is in full flower, the upper is convoluted, they having nothing in common but their receptacle. There are therefore as many florets as glumes. The style is always in three, not two, divisions. If there be three florets, the second is always raised on a partial stalk. A seed is found at the bottom of each glume. These plants seem more akin to *Cyperus*, and might, perhaps without great impropriety, be referred to that genus, as their glumes are two-ranked, and the small number of florets constitutes the only difference. That the two lowermost scales of the spikelet are barren, and therefore considered as a calyx, is no objection, the same being the case with many species of *Cyperus*. If however the present genus be allowed to remain, either on account of the fewness of its florets, or because *Cyperus* is already sufficiently extensive, the characters above given will distinguish it.”

Vahl defines eleven species of *Mariscus*, to which four more are added in Mr. Brown's *Proclonus*.

1. *M. capillaris*. Vahl n. 1. (*Schoenus capillaris*; Swartz Ind. Occ. 106. *Cyperus nanus*; Willd. Sp. Pl. v. 1. 272, excluding Plukenet's synonym.)—Spike oblong, crowded. Spikelets deflexed. Involucrum of two leaves. Stem and foliage almost capillary.—Native of the West Indies. From six to twelve inches high, very slender, resembling a small capitate *Carex*. The spikelets are three-flowered, oblong, tawny, strongly deflexed, crowded into a round head the size of a large pea.—Willdenow has this plant also at p. 268. See Vahl.

2. *M. gracilis*. Vahl n. 2.—Leaf solitary. Spike sessile, nearly globose. Involucrum of two setaceous leaves.—Found by Richard in South America. *Stems* a foot high or more, very slender, clothed at the base with two sheaths, one of which only bears a narrow leaf, two or three inches long. *Involucrum* of three leaves, two of which are two or three inches in length, the third but half an inch. *Spike* scarcely larger than a coriander seed, yellow. *Spikelets* ovate, acute, triangular when in seed. *Stamens* but two. Richard.

3. *M. apyllus*. Vahl n. 3. (*Juncus cyperoides*, culmo compresso striato, radice odorata tuberosa, capitulo rotundo

compacto; Sloane Jam. v. 1. 121. t. 81. f. 2.)—Leafless. Spike globose, sessile. Involucrum of a few broad leaves; shorter than the spike.—Native of sandy ground in the bay of Honduras. Sloane. *Root* knotty, creeping, red, fragrant like the sweet *Cyperus*, much esteemed by the Indians for curing the cholic. *Stems* a foot high, or more, rather stout, triangular, and compressed, clothed at the base with several close sheaths, but destitute of leaves. *Involucrum* of three, four, or five spreading ovate leaves, shorter than the head or spike, which is twice as big as a pea, composed of very numerous little spikelets, whose glumes are dotted with purple. *Stamens* three.—Vahl had a specimen from Senegal, which he judged the same species, though twice as large as the American plant.

4. *M. panicus*. Vahl n. 4. (*Kyllingia panicea*; Linn. Suppl. 105. Rottb. Gram. 15. t. 4. f. 1. Gærtn. v. 1. 12. t. 2. f. 8. *Mariscus biglumis*.)—Spikes cylindrical. Spikelets oblong, imbricated, accompanied by small setaceous bracteas.—Native of Arabia Felix and of Tranquebar. A foot high, with numerous leaves, as tall as the stem, and a quarter of an inch broad. *Involucrum* of two long leaves, and two or three much smaller. *Spikes* five or six, half an inch long, on spreading stalks of various lengths. *Spikelets* numerous, spreading, somewhat imbricated, their glumes with a green keel and white edges. *Seed* three-ribbed, dotted with purple.

5. *M. flavus*. Vahl n. 5.—Spikes cylindrical. Spikelets oblong, accompanied by setaceous finely ferrated bracteas, of their own length.—Gathered in South America by Von Rohr and Richard. Akin to the last, but differing in its bracteas, as well as in its broader more striated glumes. Vahl.

6. *M. ovularis*. Vahl n. 6. (*Kyllingia ovularis*; Michaux Boreali-Amer. v. 1. 29. *Schoenus umbellatus*; Jacq. Ic. Rar. t. 10. *Scirpus echinatus*; Linn. Sp. Pl. 74. Herb. Linn.)—Spikes roundish-ovate. Spikelets spreading every way. Involucrum of many leaves.—Native of North America; whether of the East Indies also we cannot determine. It is akin to the two last, but distinguished by the very numerous involucral leaves, and globose spikes, composed of spikelets that spread in all directions, resembling the head of a *Sparganium*, as Plukenet, who figures it in his t. 91. f. 4, well observes. Vahl has rightly brought together the above synonyms, as belonging to one species.

7. *M. retrofractus*. Vahl n. 7. Gærtn. t. 2. f. 5. (*Scirpus retrofractus*; Linn. Sp. Pl. 74. *Cyperus indianum*, &c.; Pluk. Phyt. t. 415. f. 4.)—Spikes loosely imbricated downward. Spikelets awl-shaped, reflexed. Involucrum of few leaves.—Native of Virginia. The whole plant has a glaucous hue. Its habit is not unlike the last, but the slender taper-pointed spikelets are all remarkably drooping, or bent downward, and but loosely imbricated.

8. *M. umbellatus*. Vahl n. 8. (*Kyllingia umbellata*; Linn. Suppl. 105. Rottb. Gram. 15. t. 4. f. 1. *Scirpus cyperoides*; Linn. Mant. 181. *Koll pullu*; Rheede Malab. v. 12. 119. t. 63.)—Spikes cylindrical, closely imbricated downward. Spikelets awl-shaped, reflexed. Involucrum of many leaves.—Native of the East Indies. The spikelets are not one-third the size of the last, much more numerous and crowded, but not so taper-pointed.

9. *M. alternifolius*. Vahl n. 9.—Spikes cylindrical, imbricated downward. Involucral leaves, as well as the flower-stalks, alternate.—Native of Guinea. *Stems* a foot high or more, as thick as a pigeon's quill, taller than the foliage. *Involucrum* of ten alternate crowded leaves, some of them as long as the stem, each accompanied by an axillary flower-stalk, full two inches long, invested with a purple

ple-dotted sheath, hardly an inch in length. *Spikes* half an inch long, green. *Vahl*.

10. *M. cyperinus*. Vahl n. 10. (*Kyllingia cyperina*; Retz. *Obf. fasc. 6. 21.*)—*Spikes* cylindrical. *Spikelets* erect, accompanied by bractæas shorter than themselves.—Native of the East Indies and Guinea. *Stems* about a foot high. *Leaves* few, mostly taller than the stem. *Involucrum* of six or seven very long leaves. *Spikes* six or seven, sessile or stalked, an inch long, imbricated upwards. *Spikelets* awl-shaped, accompanied by brittle-shaped rough bractæas, about half their own length, or rather more. *Glumes* of the calyx longer than usual; those of the corolla twice as long as the calyx, deeply furrowed, with a green keel, and pale tawny edge.

11. *M. elatus*. Vahl n. 11. (*Kyllingia incompleta*; Willd. *Sp. Pl. v. 1. 258.* Jacq. *Ic. Rar. t. 300.*)—See KYLLINGIA, from whence this species should be removed hither, with the following character.—*Spikes* cylindrical. *Spikelets* erect, with bractæas about their own length.

To these we subjoin Mr. Brown's four species, which not having seen, we could not otherwise arrange, for want of knowing their affinities.

12. *M. lavis*. Brown n. 1.—*Spikelets* awl-shaped, round, curved, of two or three florets. Umbel simple. *Involucrum* of three leaves. *Stem* smooth.—Native of the country near Port Jackson, New South Wales.

13. *M. scaber*. Br. n. 2.—*Spikelets* awl-shaped, round, curved, two-flowered. Umbel compound. *Involucrum* of many leaves. *Stem* rough.—Native of the tropical part of New Holland.

14. *M. decompositus*. Br. n. 3.—*Spikelets* straight, ovato-lanceolate, roundish, two-flowered. Umbel once or twice compound. *Spikes* somewhat capitate. *Involucrum* and leaves rough.—From the same country.

15. *M. conicus*. Br. n. 4.—*Spikelets* single-flowered. Umbel simple. *Spikes* conical, somewhat three-lobed. *Involucrum* and leaves rough.—From the same country.

MARISFELD, in *Geography*, a town of Germany, in the county of Henneberg; six miles E. of Meinungen.

MARITACACA, in *Zoology*, the name of a very remarkable American animal, more usually known by the name of the opossum.

MARITAGIUM, in *Law*, contradistinguished from *Matrimonium*, or right of marriage, denoted, in its feudal sense, the power which the lord, or guardian in chivalry had of disposing of his infant ward in matrimony. While the infant was in ward, the guardian had the power of tendering him or her a suitable match, without disparagement or inequality; which, if the infant refused, they forfeited the value of the marriage, "valorem maritagii" to their guardian; that is, so much as a jury would assess, or any one would *bonâ fide* give to the guardian for such an alliance; and if the infants married themselves without the guardian's consent, they forfeited double the value, "duplicem valorem maritagii." This, says judge Blackstone, seems to have been one of the greatest hardships of our ancient tenures.

MARITICO, in *Geography*, a river of South America, in the province of Carthagena, which runs into the Spanish Main, N. lat. 8 5'. W. long. 76° 42'.

MARITIME, of *mare, sea*, denotes any thing belonging to the sea.

MARITIME *Causæ* and *Court*. See *COURT of Admiralty*.

MARITIME *Estate*, is used in contradiction to the civil and military estate, to express that part of his majesty's lay sub-

jects, that are occupied in naval or sea service. See *MARINES* and *NAVY*.

MARITUS, in the chemical jargon, a word used to express the sulphur of metals. The writers on the subject of the philosopher's stone usually express themselves in this enigmatical manner, calling sulphur the husband, and mercury the wife in all metals; which, as they are more or less perfectly combined, make the metal more or less pure, and approaching to perfection.

MARIVAUX, PETER CARLET DE CHAMBLAIN DE, in *Biography*, a distinguished dramatical writer, was born at Paris in 1688. He enjoyed the advantages of a slight classical education only, but was regarded as a youth of parts, and the ambition of becoming an original writer was his ruling passion. One of his first attempts was a travestie of Homer, on the model of Scarron's Virgil, for the direct purpose of throwing ridicule on the father of ancient poetry. At the age of eighteen he produced, within a few days, in consequence of a wager, a comedy entitled "Le Père Prudent." This was not acted in public; and it was not till he had attained to his thirty-second year that he ventured to present upon the theatre his tragedy of "The Death of Hannibal:" the reception of this piece was far from favourable, and he thenceforth confined himself to comedy, in which he struck out a new path. This was that of a delicate and refined sentiment in the development of passion and character, which, in general, succeeded very well with a people who pride themselves on a nice perception of all the shades and diversities in the human mind. He brought out the greatest number of his pieces on the Italian theatre, which is accounted less critical than the French theatre. He produced about thirty pieces, many of which are still occasionally represented on the stage, and are popular. Marivau has obtained a greater reputation by his novels than by his dramas. The first novel which he composed was entitled "Pharlamon, ou les nouvelles folies romanesque," a kind of imitation of Don Quixote: this is less esteemed, and, indeed, less known than his two others, "Marianne," and "Le Paysan Parvenu." The "Marianne" is reckoned the principal, and it is thought, by competent judges, that few works of the class rank higher. It displays an intimate acquaintance with the human heart, and presents many truly interesting situations, and many just and elevated sentiments. The "Paysan Parvenu" is preferred by some as possessing more gaiety and variety, and a more direct moral purpose. Another work of this author deserving of notice is his "Spectateur François," which abounds in acute remarks and lively portraitures, and in wit and variety is reckoned to surpass all his other pieces. He published only two volumes for want of proper encouragement. When he had attained to his fifty-fifth year he obtained admission in the French academy. He died at the age of seventy-five, in the year 1763. He was mild, friendly, and philanthropical: full of sympathy towards the indigent and afflicted, towards whom he exercised a liberality often beyond the bounds of prudence. He was upright and disinterested, careless of fortune, and contented to live in obscurity: he was sincerely attached to religion, as the great resource of the wretched, but without any affectation of extraordinary devotion.

MARIVELAS, in *Geography*, one of the smaller Philippine islands, with a village, the houses of which were constructed of bamboo, and ascended by a ladder. One of these houses, including the roof and frame, hardly weighed, according to Perouse, 200 lbs.: but the habitation of the officiating clergyman was of stone. In the year 1780, the Moors from the islands S. of the Philippines, invaded this island,

island, burnt the village, destroyed the fort, the church, and the rector's house, and made slaves of all the Indians they could seize.

MARIVELAS Bay, a bay on the W. coast of the island of Luçon, sheltered from all winds except those from S. to S.E.; with a clean bottom of stiff mud or clay, and sufficient depth of water for vessels of any size. It takes its name from that of the above-mentioned island. N. lat. 14° 30'. E. long. 120° 24'.

MARIUM, in *Ancient Geography*, a town of the island of Cyprus, upon the southern coast, very near the sea, between Amathus to the W. and Citium to the N.E.

MARIUPOL, in *Geography*. See **MARIANOPOLI**.

MARITZ, or **MARISEA**, in *Ancient Geography*, a river of European Turkey, which rises in a chain of mountains, called Balken (the ancient Hæmus), and passing by Philopoli in a direction towards the E. and S. falls into the Ægean sea in the gulf of Enos, after a course of 200 miles. This river was the ancient *Hebrus*; which see.

MARIUS CAIUS, in *Biography*, a famous Roman commander and head of a party, was born of an obscure family in the district of Arpinum. In early youth he was distinguished by size and strength of body, and roughness of manners. Having entered into the army at the military age, he soon gave proofs of great valour, and by his conduct on various occasions, attracted the notice of his general, Scipio, who foretold his future greatness. In the consulship of Metellus and Cotta, in the year 119 B.C. he became a candidate for civil honours, and obtained the office of tribune of the people. In performing the duties of this office he obtained great reputation, and was regarded by the people as their most determined protector against patrician tyranny. He had many antagonists, and was unsuccessful in his application for the edileship; but in the year B.C. 116, he acquired the office of prætor. In the following year he was appointed to the government of the farther Spain. In this station he conducted himself with great equity, and, by his vigour, cleared the province of the banditti who infested it. At the expiration of his office he returned to Rome, where his want of birth, of fortune, and eloquence, checked his farther advancement, and, for some years, he remained idle and undistinguished. At length, in the year 109 B.C., when the consul Metellus was sent into Africa to conduct the war against Jugurtha, he offered Marius the post of one of his lieutenants, which the latter gladly accepted. The field of ambition was now open before him, and he resolved to cultivate it by all the means in his power. He ingratiated himself with the soldiery by partaking of all their hardships and dangers, and he felt neither the principles of duty or gratitude operate upon him so as to restrain him from injuring his patron Metellus in the public estimation. His success in repulsing Jugurtha, who had made an unexpected attack upon him, gave him lustre in the eyes of the army, and he did not fail to make invidious comparisons between his commander and himself. What he said was communicated by the soldiers to their friends at Rome; this prepared the way for those exertions in his favour upon which he relied for the attainment of his objects. Being determined to stand candidate for the consulship, he publicly asked leave of absence of Metellus for that purpose, who haughtily said to him, "It will be time enough for you to think of that honour when my son shall be old enough to be your colleague." After some time he was allowed to leave the army for Rome, and by his great activity and vast exertions obtained the consulship by a great majority. This was in the year 107, and the next object

of his ambition was to supplant Metellus in the command, for which purpose he did not scruple to make use of the basest means that a servile mind could invent. He obtained his object, and on his arrival in Africa with the supreme command, Metellus declined an interview, and leaving his army to be delivered up by a lieutenant, embarked for Italy. Marius spent the summer in disciplining his new levies, and in watching the motions of the two kings, Jugurtha and Bocchus. At length his gloomy heart suggested to him that the city of Capua might afford him a fit object of enterprise: he suddenly marched and surrounded it, and having forced it to surrender, he cruelly put to death all the adult males, selling the other inhabitants for slaves, and then levelling the place with the ground. This unfortunate city was situated in the African desert, and its almost instant destruction struck such terror into every place to which the knowledge of the fact could extend, that deputies came in from all sides making submission and offering him those supplies for his army which the country afforded. He next invested Mulucha, a fortress situated upon a high and insulated rock that had been deemed impregnable: after much time being spent, and various attempts to storm it had failed, he had given orders to abandon the enterprise, when a Ligurian soldier accidentally discovered an accessible part in a cleft of the rocks: by this they made themselves masters of the place, and found in it an immense quantity of treasure, so that the army were enabled to march back to the sea-coast laden with booty. On their return they were surprized by the united forces of the two kings, and brought into imminent danger, from which they were extricated by the skill and exertions of Marius, and his quæstor Sylla, who now began to distinguish himself. The Numidians, in repeated attacks, were repulsed with great slaughter, and the Roman army gained their winter-quarters in safety. In the following year overtures of peace were made by Bocchus, who agreed, as part of the conditions, to betray Jugurtha into the hands of the Romans, which was effected by the management of Sylla. By this event the war was brought to a conclusion, with no less honour to Sylla than to Marius. Owing to some sudden and unexpected danger which threatened the city Marius returned, was a second time elected consul, and obtained a triumph in consequence of his successes, at which Jugurtha and his two sons were led chained before his chariot. The war against the Gauls and Cimbri was entrusted to him, and he continued in his career of success: he was a strict disciplinarian, kept his soldiers in the most perfect obedience, and did himself honour by the equity with which he administered justice among them. An instance of this kind is mentioned, in which he not only pardoned, but rewarded a youthful soldier who had killed his nephew for an infamous attempt on his person. Thus preserving his reputation entire, and also on account of the services which he yielded his country, he was elected a third and a fourth time consul. When it was proposed to confer that high honour upon him a fifth time, he accepted it only as an obligation to free the republic from its remaining foe, and declined a triumph till his victory should be complete. In the mean time the Cimbri had poured into Italy such immense numbers of troops, that an universal panic and consternation were experienced, till Marius with his army made a junction with them, and he himself took the supreme command. A most bloody battle succeeded, and the Romans, by the superior skill of their generals, rendered the field of battle a scene of mere carnage. Almost the whole nation of the Cimbri, with their wives and children, fell in the action, or were made prisoners, while the loss of the Romans was

so small, as scarcely to be credited. The Roman soldiers were disposed to give their plebeian hero all the honour of the day, yet it was not possible to deprive Catullus of his share of the victory. Each chief built a temple which he had vowed during the action; that of Marius was consecrated to Virtue and Honour, and on the day of its dedication he gave games to the people after the Grecian manner; but being himself ignorant in such sports, he wisely withdrew as soon as they were commenced. He was now too much habituated to power to acquiesce in the condition of a private citizen, and declared himself a candidate for a sixth consulate: being, though not without the grossest corruption, elected to the office on which he had set his heart, he sought that employment for his talents at home which the reduction of foreign enemies left him no opportunity of exercising abroad. He determined to oppose himself to the rising power of Sylla, which was the foundation of the civil war. Sylla refused to deliver up the command of the forces with which he was empowered to prosecute the Mithridatic war, and he resolved to oppose the authors of the demand, which he considered as arbitrary and improper. He advanced to Rome, and Marius was obliged to save his life by flight. Unfavourable winds prevented him from seeking a safer retreat in Africa, and he was left on the coasts of Campania, where he was soon discovered, hidden in a marsh, by the emissaries of the enemy. He was violently dragged from his vile retreat, and hurried to the neighbouring town, and before magistrates entirely devoted to the interests of Sylla, who, without the smallest hesitation, passed sentence of death on their prisoner. A soldier was sent to put him to death: the man entered the apartment with a drawn sword, when he saw a light beam from the stern countenance of the illustrious captive, and heard a voice exclaiming "Tunc, homo, audes occidere Caium Marium? Dareis thou, man, to kill Caius Marius?" Overcome with terror, he rushed out, dropped his sword, and declared himself incapable of so base an action. An adventure so uncommon awakened the compassion of the people, who considered it as a divine interference in behalf of Marius, and they accordingly not only released Marius from prison, but favoured his escape into Africa. Here he joined his son Marius, who had been exciting and arming the princes of the country in his cause. Marius landed near the walls of Carthage, and received some consolation at the sight of the venerable ruins of a once powerful city, which, like himself, had been exposed to calamity, and felt the cruel vicissitude of fortune. This place of his retreat was soon known, and the Roman governor, willing to conciliate the favour of the prosperous Sylla, sent an officer to warn him to leave the province. The noble minded exile replied to the man, "Go tell thy master, that thou hast seen the banished Marius sitting on the ruins of Carthage." He soon found it necessary to seek a place of safety in a neighbouring island, where he heard that Cinna had embraced his cause at Rome; animated with this intelligence, he set sail to assist his friend and advocate, at the head of a thousand men only. His army gradually increased after he had landed in Tuscany, and he was enabled to march into Rome like a conqueror. Cinna, by his own authority, invested Marius with the title of proconsul, and would willingly have aligned him attendants belonging to that dignity; but Marius, affecting the humility of an exile worn down by age and grief, declined the honour, and appeared in squalid attire, unaccompanied, and walking slowly, with downcast looks, while a sudden ferocity broke through and struck the beholders with terror. After various actions the senate thought it necessary to treat with Cinna; he was restored to the consu-

lar dignity and invited into the city. The chiefs began their march, but Marius halted at the gate, observing, that he was a banished man, and prevented, by the laws, from entering till the sentence against him was repealed. This was speedily done, but scarcely was the decree reversed, before he began to take a most signal revenge on his enemies. Rome was filled with blood, and he who had once been called the father of his country, marched through the streets of the city, attended by a number of assassins, who slaughtered all those whose salutations were not answered by their leader. Such was the signal for murder. When Marius and Cinna had sufficiently gratified their resentment, they made themselves consuls; but Marius was already worn out with old age and infirmities, and lived but sixteen days in possession of the consular dignity with which he had been invested for the seventh time. He died in the year 86 B.C., and was thus saved from the disgrace and sufferings which awaited his party from the hand of the victorious Sylla. Marius had rendered himself conspicuous by his conquests, and infamous by his cruelties. He was unquestionably one of the greatest, and most fortunate of the Roman generals, and had, in his character, some features of rude grandeur. Rome seemed to rejoice at the fall of a man whose ambition had proved fatal to so many citizens. His chief qualifications were those of a great general, and with these he rendered himself the most illustrious and powerful of the Romans, because he was the only one whose ferocity seemed capable of opposing the barbarians that would have laid waste the empire. His son, Caius Marius was as cruel as himself, and shared his good and his adverse fortune: at the death of his father and Cinna, he became the leader of the party: he made himself consul when he was but twenty-five years of age, and he murdered all the senators who opposed his ambitious views. He was defeated by Sylla, and fled to Præneste, where he killed himself. Plutarch. Univer. Hist.

MARIUS, LEONARD, a Dutch theologian, who flourished in the 17th century, was born at Goes, in Zealand, but in what year is not known; nor have we any material facts relating to him till we find him created a doctor of divinity at Cologne. He was elected professor of theology in that university, and was afterwards chosen president of the Dutch college in that city. He was afterwards appointed vicar-general of the chapter of Haarlem, and pastor at Amsterdam. He died in the year 1628, leaving behind him a considerable character for talents and learning. He was profoundly skilled in the Greek and Hebrew languages, and in the knowledge of the sacred scriptures. He was author of "Commentarius in Pentateuchum," which is regarded as a work of great merit: "Hierarchiæ Ecclesiasticæ Catholica assertio," intended as a refutation of the famous treatise of Mark Antony de Dominis "De Republica Ecclesiastica;" and of a variety of controversial pieces in the Dutch language. Moreri.

MARK, POPE, and a saint in the Roman calendar, probably a native of Rome, and successor to pope Sylvester in the year 336. There is nothing recorded of him or of his pontifical acts that can claim the attention of our readers. Some authors say that he occupied the papal chair between two and three years, but others, and those the most worthy of credit, state that he died within nine months of his election. Moreri. Bower.

MARK, among *Bowlers*. See **BOWLING**.

MARK, in *Matters of Commerce and Manufacture*, a certain character struck, or impressed, on various kinds of commodities, either to shew the place where they were made, and the persons who made them; or to witness they have been

viewed

viewed and examined by the officers or magistrates charged with the inspection of that manufacture; or, lastly, to shew that the duties imposed thereon have been regularly acquitted.

Thus are cloths, leathers, cutlery-ware, paper, plate, weights, markures, &c. to be *marked*.

The mark on goods also is what ascertains the property or goodness thereof, &c. And if one man shall use the mark of another, to the intent to do him damage, action upon the case lieth. A penalty is inflicted in this case, by the stat. 23 Eliz. cap. 8.

MARK is also a particular sign or character, known only to the trader who pitches on it; whereby, being fixed to any commodity, he recollects the price it cost him.

These marks, otherwise called *numeros*, are taken according to the fancy of those who use them; but, ordinarily, they are chosen from among the letters of the alphabet, each having a relation to some particular number of figures. They are of so much use in trade, that the reader will not take it amiss, if we insert a little table to serve as a model for their construction:

A	B	C	D	E	F	G	H	I	K	L	M
0	1	2	3	4	5	6	7	8	9	10	20

One example will give the whole use of this table. Suppose, *v. g.* I would put on a piece of stuff, that it cost 37s. 6d. *per ell*. I put an M for 20s. an L for 10s. an H for 7s. and a G for 6d. so that the several letters written after each other (observing always to separate shillings from pounds, and from pence, by points) will make this mark M.L.H.G. equal to 37s. 6d.

Note, the mark may be diversified infinitely, by adding other figures to the letters, in lieu of these.

Ordinarily some word of a proper number of letters, all different ones, is chosen, that no relation may be traced among the letters, which may be done in the table here given.

MARK, *Marc*, or *Marco*, also denotes a weight used in several states of Europe, and for several commodities, especially gold and silver in France; where it was introduced under Philip I. about the year 1080.

The mark is divided into eight ounces, called the "poids de marc;" the ounce being subdivided into eight gros, 20 esterlins, 24 deniers, 40 mailles, and 80 felins, or 576 grains. A French mark weighs 509.4 Dutch ascs, or 3778 English grains. Thus 60 oz. poids de marc are nearly equal to 59 oz. troy; or more accurately, 4608 French grains = 3778 English grains. Diamonds are weighed by the ounce of 144 carats, each carat weighing four grains, poids de marc, or 3.279 English grains.

The poids de marc was likewise, till the revolution, the legal weight for merchandize at Paris, and in most other parts of France; the livre or pound being divided into two marks, or 16 ounces; and the ounce into eight gros, 24 deniers, or 576 grains; a quintal = 100 lb.; and a charge, three quintals; 100 lbs. poids de marc = 108 lb. avoirdupois. The apothecaries' weight in Paris was the common poids de marc, and the pound contained 16 ounces; but the ounce was divided into three duelles, four sciliques, six sextules, eight drachms, 24 scruples, or 576 grains. In other parts of France, the pound of apothecaries' weight was 12 ounces,

and was therefore three quarters of the Paris apothecaries' pound.

At Amsterdamb, the fineness of gold under the old system is expressed in carats and grains; the mark being divided into 24 carats, and the carat sub-divided into 32 parts. The fineness of silver is expressed in deniers and grains, the mark fine being 12 deniers, the denier 24 grains. According to the new system, the fineness of gold and silver is expressed by supposing it to be divided into 1000 parts, called milliemes; thus 41½ milliemes answer to a carat of gold, that is the 24th part; and 83½ milliemes to a denier of silver, or the 12th part. (See MONEY.) Nineteen marks Dutch troy weight of fine gold answer to 164 ounces of standard gold in London; and 37 marks troy of fine gold in Amsterdam are equal to 2665 ducats of gold in Hamburg. The fineness of silver is expressed in pennyweights and grains; the mark being divided into 12 pennyweights, and the pennyweight into 24 grains. A mark of fine silver, in bars, is worth 25 florins 16 silvers current, more or less; a mark of English silver coin is worth 25 fl. 12 ct. current, more or less; a mark of French silver, about 10 dwts. 21 gr. fine, is worth 23 fl. 8 st., more or less. Wrought silver must be 10½ dwts. fine, and is stamped with two crosses and a crown. Gold, silver, and coins, are weighed by the mark troy; a mark troy being divided into eight ounces, and the ounce into 20 engels, or 640 ascs. This weight is the same in all parts of Holland; 10,000 ascs are equal to 7417 grains, English troy weight; hence, two marks, or a pound, Dutch troy weight = 15 ounces, 16 pennyweights, 11 grains, English troy weight, or 7595 grains; and 90 ounces, Dutch troy, weigh 89 ounces, English troy; or 135 lbs. Dutch troy, 178 lbs. English troy weight. In weighing pearls and diamonds, the mark troy is divided into 1200 carats, so that one engel, or 32 ascs, is then equal to 7½ carats; these are subdivided into halves, 4ths, 8ths, 16ths, 32ds, and 64th parts. The assaying weight contains 12 pennyweights, of 24 grains each, to the mark; and at the mint, one engel is divided into four vierlings, eight troykens, or 16 dueskens. In the commercial weight, 1 lb. contains 2 marks, 16 ounces, 32 loots, or 128 drams, and weighs 10,280 ascs, Dutch troy weight, or 7625 English grains.

At Cologne the pound is divided into 2 marks, 16 ounces, 32 loths, 128 quints, or 256 pfenings. This weight is the same as that with which gold and silver are weighed in Hamburg, particularly at the bank; and, by an edict of the emperor Charles V. of 1524, the Cologne mark was made the standard weight for coin all over the empire, and still continues the same. The Cologne mark must weigh 3608 English grains, 4400 French grains, 4352 Cologne eichen (a division used in Hamburg) or 4864 Dutch ascs; and in the valuation of coins, it is divided into 65,536 parts, called richtpfenings, each Cologne pfening containing 256 such parts; 480 marks Cologne weight = 451 ounces English troy; and 100 lbs. Cologne weight = 103 lbs. avoirdupois.

At Dantzic, the mark of fine gold is divided into 24 carats, and each carat into 12 grains; the mark of fine silver into 16 loths, each of 16 pfenings; wrought silver is from 12 loths 12 pfenings, to 13 loths fine; a mark, gold and silver weight, is divided into 8 ounces, 16 loths, 24 schotts or carats, 64 quintlins, or 256 pfenings; and weighs 3974 Dutch ascs, or 2947½ English grains. Hence 30 oz. of Dantzic gold and silver weight = 23 oz. English troy nearly; or 45 marks of Dantzic = 23 lbs. troy.

At Geneva, the ounce of fine gold is reckoned at 24 carats, subdivided by some into 32, by others into 24 parts. The mark of fine silver is reckoned at 12 deniers; and the

denier subdivided into 24 grains. The carat of fine gold is worth $48\frac{1}{2}$ sous current, or the ounce, 58 livres 4 sous, more or less; the denier of fine silver, $54\frac{1}{2}$ sous; or the mark, 32 livres 14 sous, more or less.

The mark with which gold and silver are weighed is generally considered the same as the French mark; some writers, however, state that 100 marks of Geneva are equal to 100 marks 1 oz. 13 deniers 22 grains, French poids de marc, the difference being $\frac{2}{3}$ per cent. In this case, 450 ounces of Geneva gold and silver weight answer to 451 ounces French, or $443\frac{1}{2}$ ounces English troy weight.

At Hamburgh, the fineness of gold is expressed in carats and grains; the mark fine (that is, the mark of fine gold) being reckoned at 24 carats, or 288 grains. Gold is sold by ducats; and $23\frac{1}{2}$ carats, or 282 grains of the Cologne mark of fine gold, are valued at 67 such ducats: hence 47 Cologne marks (or 353 ounces 5 dwt. 16 gr. English troy) weigh 3216 ducats, each valued at 96 shillings banco, more or less; 47 Cologne marks of Portugal gold, 22 carats fine, are reckoned at 2948 ducats; and 43 such marks of gold, $21\frac{1}{2}$ carats fine, at 2692 ducats. Light ducats are sold by the mark; and for each full ducat weight, about $96\frac{1}{2}$ shillings banco are given. The fineness of silver is expressed in loths and grains; the mark fine being reckoned at 16 loths, or 288 grains. The Cologne mark of fine silver, in bars, is sold at about 27 marks 10 or 12 shillings banco; the mark of fine silver, in pieces of eight, that is, Spanish dollars, valued at $14\frac{2}{3}$ loths fine, is commonly a few shillings lower. But as the dollars coined since 1772 are at most only $14\frac{1}{2}$ loths (that is, 10 oz. $17\frac{1}{2}$ dwt.) fine, it occasions a difference in the price; because 88 marks of fine silver, in dollars valued at $14\frac{2}{3}$ loths fine, contain, in reality, only 87 marks of fine silver. In former times, for 2 marks of old but not worn-out dollars, 17 pieces were reckoned; and such a piece was sold for 48 shillings banco, more or less: whereas 1000 new rix-dollars now weigh 115 marks 4 to 8 loths; and 12 such marks are reckoned for 11 marks of fine silver.

Gold, silver, and coins, are weighed with the Cologne weight. The pound contains 2 marks, 16 ounces, or 32 loths; the ounce, 2 loths, 8 quintins, 32 pfenings, 544 eschen, or 8192 richt-pfenings. The Cologne mark weighs 3608 English grains; so that 480 ounces, Cologne weight, are equal to 451 ounces English troy weight. Pearls and diamonds are weighed by the carat of 4 grains; the carat being divided into 8, 16, 32, and 64 parts: 71 such carats weigh half an ounce, Cologne weight; hence a carat = 3.176 English grains. In the commercial weight, the pound is divided into 2 marks, 16 ounces, or 32 loths; the ounce into 2 loths, 8 quintins, 32 pfenings, or 630 asen. This pound answers to 33 loths $2\frac{1}{2}$ pfenings, Cologne weight; that is, $96\frac{1}{2}$ pounds Hamburgh weight answer to 100 pounds Cologne weight; and 103 pounds Hamburgh weight = 110 pounds avoirdupois weight.

At Leipsic, gold and silver are weighed with the Cologne mark. The mark of light ducats is worth about 190 rix-dollars current; the mark of light louis-d'ors, or pistoles, 172 rix-dollars, more or less; and the mark of fine silver, 13 rix-dollars, more or less, all in the new Saxon currency. The mark of wrought silver, in Saxony, is 12 loths (or $\frac{1}{12}$ ths) fine. In the commercial weight, the pound is 2 marks, 16 ounces, or 32 loths; and the loth, 4 quintins, 16 pfenings, 32 bellers, or 240 grains: 102 pounds of the Leipsic heavy weight, or a centner of 110 pounds of the common weight, answer to 113 pounds avoirdupois nearly; or 35 pounds of Leipsic common weight = 36 pounds avoirdupois. The

commercial weight of Leipsic is the standard weight all over Saxony.

At Milan, gold and silver are weighed by the mark of 8 ounces; the ounce being 24 denari, or 576 grani. The mark of Milan weighs 7 ounces 16 deniers 10 grains, French poids de marc, or 3629 English grains: hence 192 marks of Milan answer to 121 pounds English troy, or 128 ounces of Milan to 121 ounces English troy.

At Mantua, the weight for gold and silver is the same as in Milan; but the commercial weight of Mantua is about 2 per cent. lighter, or 100 pounds of Mantua = $63\frac{1}{2}$ pounds avoirdupois.

For further particulars, see the names of the several countries and principal towns in this dictionary; and for a fuller account, see Kelly's Universal Cambist., vol. i.

MARK is also used among us for a money of account; and, in some other countries, for a coin.

The English mark, formerly in circulation, is two-thirds of a pound sterling, or 13s. 4d.; and Matthew Paris observes, it was of the same value in 1194. The ancient Saxons, as many antiquarians have supposed, called the marc *mancus*, or *manusa*, and *mearc*; among them it was equivalent to thirty pence, *i. e.* to seven shillings and sixpence of our money. But Dr. Milles, dean of Exeter, has lately suggested that the mancus and mark were not the same. Mr. Clarke observes, that the Danish silver mark was 20s., or one hundred Saxon pennies; and that the gold mark was twelve times as much; whereas the French mark was 13s. 4d. or one hundred and sixty pence: and he has shewn, that the method of computing by the silver mark was introduced later into France, where it commenced between A. D. 1075 and 1093, than into England. He discovers traces of it in England from the Danish kings till after the time of Henry II. The gold coin struck from Edward III. to Edward IV. were divisions of the mark, as half-marks, quarter-marks, and half-quarter-marks, at 6s. 8d., 3s. 4d., 20d. each: but from Edward IV., when our connections with France ceased, the old way of computing by the pound came again into fashion; but, as that by marks was jointly used, angels, and angelots, or half angels at 6s. 8d. and 3s. 4d. each, passed sometimes as parts of them. However, about 40 years afterwards, this regard to the marks in our coins was quite laid aside, and all the principal gold coins were struck in proportion to the pound sterling. Connexion of the Roman, Saxon, and English Coins, &c. p. 307, &c.

The mark-lubs, or Lubec-mark, used at Hamburgh, is also a money of account, equal to $2\frac{1}{2}$ shillings Flemish, or 32 grotes; consequently the shilling or fol-lubs is 2 grotes or pence Flemish. The rix-dollar is 3 marks, 48 shillings, or 576 pfenings. The rix-dollar of exchange is 2 marks, 32 shillings, or 384 pfenings. The pound Flemish is $2\frac{1}{2}$ rix-dollars, $7\frac{1}{2}$ marks, 20 shillings Flemish, 120 shillings lubs, 240 grotes Flemish, 720 dreylings, or 1440 pfenings. Each mark is divided into sixteen fols lubs.

At Copenhagen, accounts are kept in rix-dollars of 6 marks, or 96 shillings Dansk or Danish; and this is the general way of keeping accounts throughout Denmark, except in the duchies of Holstein and Sleswick, where they are kept in rix-dollars of 3 marks, or 48 shillings lubs; and at Elsinour on the Sound, where they are kept in rix-dollars of 4 orts, or 96 skillings Danish. The base rix-dollar (stet-daler), an imaginary coin, is reckoned at 4 marks, or 64 skillings Danish. A mark is divided into 16 skillings or shillings; and a skilling into 2 fyrkes, 3 wittens, or 12 pfenings Danish. The Danish denominations of marks and shillings

shillings have only half the value of the same denomination in lubs or Hamburg money: thus, 2 marks Danish are worth 1 mark Hamburg, &c. In coins, the effective rix-dollar, in which the bank of Altona keeps its accounts, is reckoned at 6 marks Danish: in the Sundish specie, in which the tolls are paid by ships sailing through the Sound, this coin is about $2\frac{1}{2}$ per cent. worse than the former; or, more correctly, 472 rix-dollars Sundish specie = 459 rix-dollars specie: crown money is $15\frac{1}{4}$ per cent. lower than specie; Danish currency, in which the books of merchants and tradesmen are kept, which is $6\frac{1}{4}$ per cent. worse than crown money, and $22\frac{1}{2}$ per cent. worse than specie; and Holstein currency, in which accounts are kept in Holstein and Sleswick, is 25 per cent. below specie. The coins of Denmark are, in gold, ducats specie, which, as well as Dutch ducats, are worth 14 marks 12 shillings Danish currency, more or less; current ducats coined since 1757, at 12 marks Danish currency; Christian-d'ors, coined in Holstein since 1775, which are worth about 13 marks lubs, or 26 marks Danish currency. In silver, the specie rix-dollars pass for 7 marks 6 skillings Danish currency, and are commonly reckoned at 6 marks 12 skillings crown money, at the toll on the Sound; double, single, and half crowns, at 8, 4, and 2 marks crown money, or 8 marks 8 skillings, 4 marks 4 skillings, and 2 marks 2 skillings current; double and single pieces called Ebrœers or Justus Judex, at 28 and 14 skillings; rykforts at 24 skillings, and pieces of 15, 10, 8, 4, and 2 skillings currency. In copper, pieces of 1 skilling Danish; fyrkes or $\frac{1}{2}$ skillings; and dreylings or $\frac{1}{3}$ skillings. The new Holstein currency, coined since the year 1788, consists of specie rix-dollars, at 48 skillings specie, or 60 skillings Holstein currency; and pieces of 32, 16, 8, 4, and 2 skillings specie, or 40, 20, 20, 5, and $2\frac{1}{2}$ skillings Holstein currency. In this money, the Cologne mark of fine silver is coined into $9\frac{1}{2}$ rix-dollars specie, or 11 $\frac{9}{16}$ rix-dollars currency. Silver in bars is taken at the Danish banks at the rate of $9\frac{1}{4}$ rix-dollars per mark fine, provided it is not under 13 loths fine. Foreign gold coins in Denmark pass as follow: pistoles, Fredericks, and such like coins, for 12 marks 11 skillings lubs; carolins for 15 marks 9 skillings ditto; guineas for 15 marks 12 skillings ditto; old French louis-d'ors for 15 marks 7 skillings ditto; Portugal pieces of 6400 rees for 27 marks ditto; ducats for 7 marks 3 skillings ditto, or double the value in marks and skillings Danish: 67 of the ducats specie, coined by the king of Denmark as duke of Holstein, being of the same weight and fineness as those of the empire, should weigh a Cologne mark, $23\frac{1}{2}$ carats fine; $85\frac{1}{2}$ ducats currency must contain a Cologne mark of fine gold, and they are little more than 21 carats fine. From a Cologne mark of fine silver, $62\frac{1}{2}$ marks in crowns, or 68 marks in silver currency should be coined; and by a royal edict of 1776, $9\frac{1}{4}$ rix-dollars specie are to contain a mark of fine silver, each piece weighing 537,69 eschen, Cologne weight, or 447.9 English grains, and being 14 loths or $\frac{1}{4}$ ths fine; so that it contains 391.9 English grains of fine silver. The rix-dollar Danish currency, in current ducats or 12 mark-pieces, is equivalent to 28.48 German ases, or 21 $\frac{1}{2}$ English grains of fine gold; and the same rix-dollar, in silver currency, contains 429 ases, or 318 grains of fine silver: the rix-dollar in crowns may be valued at 467 ases, or 346 $\frac{1}{2}$ grains of fine silver; thus the proportion of gold to silver is as 15,85 to 1. See RIX-DOLLAR.

The pound, gold and silver weight, contains 2 marks, 16 ounces, or 32 lods; the lod, four quintins, 16 orts or penings, or 272 eschen. This is called Cologne weight,

but it is somewhat heavier, 608 marks of the Danish weight being equal to 611 marks of the Cologne weight; so that the Danish mark weighs 3625 English grains; 160 ounces Danish silver weight are equivalent to 151 ounces English troy weight; and 240 marks, or 120lbs. Danish silver weight = 151lbs. troy. The commercial weight is to the gold and silver weight as 17 to 16, and the pound has the same divisions; it weighs 7703 English grains; and 100lbs. of Copenhagen = 110lbs. avoirdupois. Kelly's Universal Cambiit. vol. i.

MARK, County of, in *Geography*, a principality of Germany, bounded on the N. by the county of Recklinghausen, and bishopric of Munster, on the E. by the duchy of Westphalia, on the S. by the duchy of Berg, and on the W. by the duchies of Berg and Cleves. The soil of this county is fertile; it has good meadows, and also arable land, which produces wheat, rye, barley, oats, buckwheat, peas, beans, rape, turnip seed, flax, and hemp, in such plenty as to supply neighbouring countries. It furnishes also all kinds of fruits and legumes. Its mountains yield coal, iron, lead, copper, and silver ores, and quarries of stone. It contains more than 20 towns; its inhabitants are partly Roman Catholics and partly Protestants, all of whom enjoy the free exercise of their religion. The manufactures of the country furnish commodities for exportation; and especially articles of wrought iron and steel. The ancient counts of Mark derived their origin from the counts of Altona; and this territory was transferred, after having been possessed by Adolphus V. count of Mark and of Cleve, together with Cleve, to the electoral house of Brandenburg. The capital is Hamm.

MARK Burgel, a town of Germany, in the principality of Culmbach; 13 miles N.W. of Anspach.

MARK Lenkarheim, a town of Germany, in the principality of Culmbach; 14 miles N. of Anspach.

MARK Mansee, a town of Austria; 10 miles N. of St. Wolfgang.

MARK Maffareen, a town of Syria, in the pachalic of Aleppo, containing about 150 houses; it is generally the halting place for the caravans between Scanderoon and Aleppo.

MARK Oldendorf, a town of Westphalia, in the bishopric of Hildesheim; six miles W. of Eimbeck.

MARK Schelken, a town of Transylvania; four miles N. of Stoltzenberg.

MARK, St., a town of the island of Hispaniola, situated on a bay, on the W. coast, to which it gives name. The chief productions of the vicinity are sugar, indigo, coffee, and cotton; 48 miles from Port Paix. N. lat. 19° 18'. W. long. 72° 42'.—Also, a river of East Florida, which runs into Apalache bay, a little below the town of St. Mark.—Also, a sea-port town of East Florida, near the mouth of the river just mentioned. N. lat. 30° 10'. W. long. 84° 36'.

MARK, Gospel of St., in *Biblical History*, a canonical book of the New Testament, being one of the four gospels. Mark the evangelist is mentioned in 1 Pet. v. 13, and Dr. Lardner supposes, for reasons which he has adduced, that he was the same with John Mark, whose name occurs in the Acts and in some of St. Paul's epistles, and accordingly that he was the fellow labourer of Paul, and Barnabas, and Peter. He was the son of Mary, a pious woman at Jerusalem, and an early believer, at whose house the disciples used to meet, and to which Peter frequently resorted. (Acts, xii. 12.) The deliverance of Peter recorded in this passage, happened in the year 44. At this time Mark, called in

Col. iv. 10, "sister's son to Barnabas," went from Jerusalem to Antioch with Paul and Barnabas; and soon after, he accompanied them to other countries as their minister (Acts, xiii. 5.); but declining to attend them during their whole progress, he returned to Jerusalem, and kept up an intercourse with Peter and the other apostles. When Paul and Barnabas settled at Antioch, after the termination of their journey, we find Mark with them, and disposed to attend them in their journies. At this time he went with Barnabas to Cyprus; and afterwards he accompanied Timothy to Rome, in consequence of the particular request of the apostle Paul, during his confinement in that city. (2 Tim. iv. 11.) From Rome he probably went to Asia, where he met with St. Peter, with whom he returned to this city, and where he is supposed to have written and published his gospel. Such are the outlines of the history of this evangelist, furnished by the New Testament. From Eusebius, Epiphanius, and Jerom we learn, that Mark, after he had written his gospel, went to Egypt, and founded a church at Alexandria, where, according to the last of these ancient writers, he died in the eighth year of Nero, and was buried. Some authors have asserted, that he died a martyr; but this fact is not mentioned by Eusebius, or other more ancient writers; and the expressions of Jerom seem to imply a natural death. Fabricius, in his account of St. Mark, says nothing of his having been a martyr. From various authorities cited by Dr. Lardner, it appears that the evangelist Mark was a companion of Peter in the latter part of his life, and that he had great advantages from that apostle's preaching for composing a gospel; and that he was well acquainted with Barnabas and Paul, and other apostles and disciples, who had been eye-witnesses of Jesus, besides Peter. Some have supposed, that he was one of Christ's 70 disciples; but whether this was the case or not, of which there is no decisive evidence, he was an early believer, and an early disciple and companion of the apostles, and intimately conversant with them, and thus, as well as by hearing Peter preaching in Judea, and other places, and lastly at Rome, he was well qualified for writing a gospel.

St. Mark wrote his gospel at Rome, where he accompanied St. Peter, in the year of Christ 64 or 65. Many of the most ancient writers assert, that St. Mark was no more than an amanuensis or interpreter to St. Peter, who dictated this gospel to him; others affirm that he wrote it after St. Peter's death. It is probable that it was composed long before Peter's death, and that it was not published, or did not become generally known, till after the death of Peter and Paul. This gospel appears, from the accounts given of it by the ancients, to contain the substance of Peter's preaching; and the gospel itself affords evidences of its being written according to that apostle's discourses, or according to information and directions given by him to this evangelist. Many circumstances tending to Peter's honour, and recorded by the other evangelists, are not mentioned in this gospel. (See Matt. xvi. 16—20. compared with Mark, viii. 29, 30. Matt. xvii. 24—28. compared with Mark, ix. 30—33. Luke, xxii. 31, 32. John, xiii. 6, &c. John, xviii. 10. compared with Mark, xiv. 47. John, xxi. 7. John, xxi. 15. John, xxi. 18, 19.) However, there are many things that occur in this gospel, which are omitted by the other evangelists, see Mark, i. 13. 20. 29. 33. 35, 36, 37. 45. ii. 2. iii. 5, 6. 17. 19. iv. 26—29. 34. 36. 38. v. 1. 19. vi. 13. vii. 2, 3, 4. 21, 22. 31. 37. viii. 22—26. x. 46. 52. xi. 13. xii. 41. 44. xiii. 3, 4. xiv. 51, 52. xv. 21. xvi. 7.; and this fact proves, that Mark was not an epitomizer of Matthew, as some have supposed, nor of any other author, and that he was well acquainted

with the things of which he undertook to write a history. He writes as an eye-witness, or as one who had full and authentic information at the first hand. Hence Lardner justly concludes, that St. Mark's gospel, though short, is a very valuable and masterly performance. The learned have been divided as to the language this gospel was wrote in, some affirming it was composed in Greek, which is the more general and probable opinion, others in Latin. Several of the ancient heretics received only the gospel of St. Mark: others, among the Catholics, rejected the twelve last verses of this gospel. But Dr. Lardner refers those who doubt the genuineness of this part of the gospel, for satisfaction, to Dr. Mill, and to the observations of Grotius, at the beginning of that chapter, and to Beza upon the ninth verse; and for explaining those twelve verses, and reconciling them with other evangelists, he refers to Grotius and other commentators. Lardner's Works, vol. vi.

MARK, *St.*, *Canons of*, a congregation of regular canons, founded at Mantua, by Albert Spinola, a priest, towards the end of the twelfth century.

Spinola made a rule for them, which was approved, corrected and confirmed, by several succeeding popes. About the year 1450 they were reformed, and followed only the rule of St. Augustine.

This congregation, which at first consisted of eighteen or twenty houses of men, and of some for women, situate in Lombardy, and the state of Venice, having flourished for the space of four hundred years, declined by little and little, and was at length reduced to two convents; and in 1584, that of St. Mark, at Mantua, which was the chief, was given, by the consent of pope Gregory XIII. to the Camaldulians; and so the congregation became extinct.

MARK, *St.*, *Knights of*, an order of knighthood in the republic of Venice, under the protection of St. Mark the Evangelist.

This order was instituted in the year 737, the reigning doge being always grand master: it was always in great esteem, being only conferred on those who had performed signal services to the commonwealth. The badge of the order is a medallion of gold richly chased, with a winged lion sejant, the wings elevated, holding in his sinister paw a sword erect, the dexter resting upon a book open; upon it are these words, "PAX TIBI, MARCE, EVANGELISTA MEUS:" on the reverse, the portrait of the reigning doge, with the image of St. Mark, delivering a standard to him. The medal is worn at the breast, pendant to a chain of gold.

MARK, in *Law*, is the sign of the cross affixed by the illiterate vulgar, to deeds, &c. when unable to write their names. See SEAL.

MARK, in the *Manege*. A horse marks, that is, he shews his age by a black spot, called the bud or eye of a bean, which appears, when he is five and a half, in the cavity of the corner teeth, and is gone when the horse is eight years old. After that age he ceases to mark, and is said to have razed. See AGE in *Horsemanship*, and EYE of a Bean.

MARK, in *Rural Economy*. See LAND-mark.

MARK, *Sea*, in reference to *Navigation*, &c. See BEACONS.

MARK, *Letters of*. See LETTERS and MARQUE.

MARK-*Statutes*, are graduated stakes or posts to shew the rise or fall of water in a river, canal, or reservoir.

MARKAN, or MARKHAN, in *Geography*, a town of Grand Bucharia; 70 miles N.W. of Balk.

MARKARYD, a town of Sweden, in the province of Smaland; 50 miles S.W. of Wexio.

MARK.

MARKDORF, or MARCHDORF, a town of the duchy of Baden; nine miles N.E. of Constance. N. lat. 47° 45'. E. long. 9° 22'.

MARKEN, a small island on the west side of the Zuyder see, near the coast of Holland; two miles E. of Monikedam.

MARKERSDORF, a town of Saxony, in the circle of Neustadt; six miles E. of Weyda.

MARKESDORF, a town of Bohemia, in the circle of Leitmeritz; four miles S. of Kaumitz.

MARKET, a public place in a city or town, where provisions are exposed to sale.

The word is formed from the French, *marché*, which signifies the same.

MARKET is also used for a liberty or privilege, either by the king's grant, or by long and immemorial usage and prescription, which presupposes such a grant, whereby a town is enabled to keep a market.

If any person set up a fair or market so near mine that he does me a nuisance, it is a nuisance to the freehold which I have in any market or fair; but in order to its being a nuisance, it is necessary, 1. That my market or fair be the elder, otherwise the nuisance lies at my own door; 2. That the market be erected within the third part of 20 miles from mine. For sir Matthew Hale (on F. N. B. 184.) construes the *dieta*, or reasonable day's journey, mentioned by Bracton (l. 3. c. 16.) to be 20 miles; as it is usually understood, not only in our own law (2 Inst. 567.), but also in the civil (Ff. 2. 11. 1.) from which we probably borrowed it. So that if the new market be not within seven miles of the old one, it is no nuisance; for it is held reasonable, that every man should have a market within one-third of a day's journey from his own home; that, the day being divided into three parts, he may spend one part in going, another in returning, and the third in transacting his necessary business there. If such market or fair be on the same day with mine, it is *prima facie* a nuisance to mine, and there needs no proof of it, but the law will intend it to be so; but if it be on any other day, it may be a nuisance; though whether it is so or not, cannot be intended or presumed, but I must make proof of it to the jury. Blackst. Com. book iii. See FAIR.

In former times, it was customary to have most fairs and markets kept on Sundays, and in the church-yard, so that matters of business and devotion were transacted all at the same place and time; which custom, though prohibited by several kings, particularly 13 Ed. I. stat. 2. cap. 6. was yet held up till the reign of king Hen. VI. when it was effectually suppressed, 27 Hen. VI. cap. 5. In many places they are still kept in the church-yard.

In the country, things sold in the markets, are to be in the usual place appointed for the sale; and market overt is only held on the special days, provided for particular times by charter or prescription; but in London every day, except Sunday, is market-day (Cro. Jac. 68.), and every shop is a market overt, for such goods as are put there, to be sold by the trade of the owner (5 Rep. 83. 12 Mod. 521.); though if the sale be in a warehouse, and not publicly in the shop, the property is not altered. Sale upon a Sunday, though in a fair market, will not alter the properties of the thing sold. If my goods are stolen from me, and sold, out of market overt, my property is not altered, and I may take them wherever I find them.

Persons that dwell in the country, may not sell wares by retail in a market-town, except in open fairs; but countrymen may sell goods in gross there. (1 and 2 P. and M. cap. 7.) All contracts for any thing vendible in fairs or

markets overt shall be binding, and sales alter the property, if made according to the following rules. 1. The sale is to be in a place that is open, so that any one who passeth by may see it, and be in a proper place for such goods. 2. It must be an actual sale, for a valuable consideration. 3. The buyer is not to know that the seller hath a wrongful possession for the goods sold. 4. The sale must not be fraudulent, betwixt two, to bar a third person of his right. 5. There is to be a sale and a contract, by persons able to contract. 6. The contract must be originally and wholly in the market overt. 7. Toll ought to be paid, where required by statute. The Mirror informs us (c. 1. § 3.), that tolls were established in order to testify the making of contracts, for every private contract was discountenanced by law; inasmuch that our Saxon ancestors prohibited the sale of any thing above the value of 20 pence, unless in open market, and directed every bargain and sale to be contracted in the presence of credible witnesses. 8. The sale ought not to be in the night, but between sun and fun; though if the sale be made in the night, it may bind the parties. Sale of goods stolen in London, or within two miles thereof, to brokers, &c. alters not the property. 1 Jac. I. cap. 21.

In market overt, if the goods be the property of the king, such sale (though regular in all other respects) will in no case bind him; though it binds infants, feme coverts, idiots, or lunatics, and men beyond sea or in prison; or if the goods be stolen from a common person, and then taken by the king's officer from the felon, and sold in open market; still if the owner has used due diligence in prosecuting the thief to conviction, he loses not his property in the goods. (Bacon's Use of the Law, 158.) So likewise, if the buyer knoweth the property not to be in the seller, or there be any other fraud in the transaction; if he knoweth the seller to be an infant or feme covert not usually trading for herself; if the sale be not originally and wholly made in the fair or market, or not at the usual hours (according to the rules above specified); the owner's property is not bound thereby. (2 Inst. 713, 714.) If a man buys his own goods in a fair or market, the contract of sale shall not bind him, so that he shall render the price; unless the property had been previously altered by a former sale. (Park. § 93.) And, notwithstanding any number of intervening sales, if the original vendor, who sold without having the property, comes again into possession of the goods, the original owner may take them, when found in his hands who was guilty of the first breach of justice. (2 Inst. 713.) By which wise regulations, the common law has secured the right of the proprietor in personal chattels from being deprived, so far as was consistent with that other necessary policy, that purchasers, *bonâ fide*, in a fair, open, and regular manner, should not be afterwards put to difficulties by reason of the previous knavery of the seller. But there is one species of personal chattels, in which the property is not easily altered by sale, without the express consent of the owner, and those are horses. (2 Inst. 719.) For a purchaser gains no property in a horse that has been stolen, unless it be bought in a fair or market overt, according to the directions of the statutes 2 P. and M. c. 7. and 31 Eliz. c. 12. See HORSE.

A piepowder court is incidental to a market, as well as a fair. (See COURT.) Keeping a fair or market, otherwise than it is granted, as on two days, when only one is granted, or on any other day than that appointed, &c. is cause of forfeiture. And if a person erects stalls in a market, and does not leave room for the people to stand and sell their wares, so that they are thereby forced to hire such stalls, taking money for the use of them is extortion.

MARKET, *Court of the Clerk of the*. See *CLERK of the Market*.

MARKET, *Clerk of the*, in the king's household. See *CLERK*.

MARKET-towns. See *TOWNS*.

MARKET, in *Rural Economy*, the town or place where any kind of articles, whether for the purpose of consumption as food, or other means, are exposed to sale. The advantages of having these near and convenient, are of vast importance to the farmer in the disposal of his different products. And in this view it becomes the duty of every farmer, before renting a farm, to carefully ascertain its situation in regard to markets for the sale of agricultural productions. The markets in the more fertile and populous parts of this country, are in general, a late writer supposes, good, and by means of turnpike-roads, inland navigations, or sea-carriage, easy of access; but were the regulations which have been proposed to be adopted by government, respecting the sale of grain established, and one general standard for weights and measures fixed upon, they would be still more improved. The state of the markets in the remote parts of this part of the island, as well as Scotland, is very materially different; and while the proprietors of these districts remain so inattentive to their own interests, it is not probable that any material alteration will take place for the better. The loss and inconvenience which the Welsh and Highland farmers are often subjected to, by being obliged to dispose of their cattle on credit, are very great, and require the exertion of the chief proprietors in the particular districts, to apply with effect in order to remove them. In these districts, it is supposed, the cultivators of grain are as ill situated, in regard to markets, for the sale of the produce of their farms, as those who keep breeding stocks of cattle and sheep. The effects of the want of markets, as described in the Report of Pembrokeshire, applies very particularly to them. "The number of inhabitants, who live by handicraft business, or who buy their provisions, is but small in proportion to those employed in agriculture, which occasions the demand for corn and butcher's-meat in our markets to be small. Hence, those who grow a large quantity of corn, find a great difficulty in selling it. We have corn-dealers at the ports, who purchase corn during the autumn and winter months, at a price always much below what is sold at the same time in the open markets. When wheat is six shillings the bushel in the market, the dealers will hardly give five, and other grain in proportion. The reasons for this difference between the dealer's price and the market price are these; he buys with a design to export his corn to Bristol, or some other English port; he must take care in buying, to provide for store-house rent, portage, freight, insurance by sea, commission on sales at the port he sends it to; and, lastly, for his own trouble and capital employed. Besides all these expences, he runs another material risk: our corn is generally so damp, that it will not keep in the lofts without being laid thin, and turned at least once a-week. If, in going to a port, a vessel meets with contrary winds, and is delayed on her voyage, the cargo frequently heats to such a degree, as to reduce its price below prime cost, and then the dealers suffer a great loss by the venture." From this account of the state of the markets in the remote parts of this country, it is supposed, "may be inferred, the advantages which the proprietors of such districts would derive by establishing manufactures, whereby markets would be brought home, as it were, to every farm. Where that cannot be effected, inland navigations, where practicable, as being infinitely preferable to turnpike-roads for the carriage of corn to market, and for bringing manures in return,

ought to become the next object of the proprietor's attention. By these the possessors of distant corn farms, are often put nearly upon a footing with those in the more immediate neighbourhood of the best markets in the country. But it may frequently happen, that it would be impracticable to establish extensive manufactures, such as would have the effect of creating a market for the surplus produce of a district, and physically impossible to form canals, so as to open a communication with other distant markets; in such cases, good level well made roads are the only alternative. These, although an expensive mode of conveyance, are highly beneficial, particularly in inland districts remote from markets, and where it is impossible to form canals. Corn and meal are frequently carried in very great quantities from the southern counties of Scotland, to the Edinburgh and Glasgow markets, which, without turnpike-roads, would scarcely be practicable, at least the expence to the farmers would be so great as to amount almost to a prohibition, and would necessarily compel them to turn their attention to breeding and grazing, rather than the tillage system of husbandry, which, under such circumstances, would certainly turn out the most profitable." The degree in which the situation of a farm is, in regard to markets, must obviously influence both proprietors and tenants, in making choice of particular rotations or modes of cropping in preference to others. Where no exertions can approximate markets to a farm, which would otherwise be well adapted to the cultivation of grain, breeding and grazing cattle, or other species of live stock, is, it is supposed, the best method in which such farm can be occupied. These, if not sold in the district, can be carried to distant markets almost without roads, and at a comparatively trifling expence. Were the markets for the sale of cattle in the north of Scotland and in Wales, as well regulated as in other parts of this kingdom, the most beneficial consequences would ensue, as, except in these districts, scarcely any improvement can be suggested. The dealers in cattle residing in the various districts of Scotland, except those in the south and south-west, generally move their cattle southward at two seasons, August and October; at which periods, what may be called the two great national markets for the sale of black cattle are held at Falkirk in Stirlingshire. There it is not uncommon to see 30 or 40,000 black cattle exhibited for sale in one day; these being either purchased by dealers from England, or by some of the principal people in that line in Scotland, and thence driven forward to markets in the former part of the country. Probably nineteen out of twenty of the Scotch cattle enter this country by the way of Carlisle; and matters are so contrived, that there are cattle fairs, one succeeding another at proper intervals, during the whole course of the journey from the last place to the southern parts of Surry. From Carlisle to the southern parts of Yorkshire, the droves are conducted along the same line of road. They are then branched off from the great London road in different directions; some going through the eastern parts of the country towards Norfolk, Suffolk, and Essex; and the remainder through the western part of Nottinghamshire, Leicestershire, Northamptonshire, Buckinghamshire, &c.; and such as are not sold in these districts, are sent to Barnet in Middlesex, as a centre, and are there exposed to sale. When any of them remain unsold after Barnet fair, which, owing to a combination of unfavourable circumstances, sometimes happens, they are sent forward to markets in Surry, Dorset, &c. which also succeed each other in the same manner. "From this arrangement, were the farmers in the remote districts to receive ready money for their cattle when sold, it is presumable, that from the competition

competition which generally takes place among the dealers at the provincial fairs, they would receive a fair adequate price, considering the risk of lameness or death, bad sales, and the great expence attending driving cattle to such distant markets."

In the Agricultural Report of the West-Riding of Yorkshire, it is observed, that a "very considerable corn-market is held at Knaresborough in that county, where dealers from the western parts of the riding attend, and purchase grain from the farmers in that neighbourhood; a great part of which is re-fold at Shipton-market, in Craven, and carried still farther westward, where corn is scarce, and gives employment to a number of people who are concerned in this traffic. It is under circumstances of this kind that public markets for grain can be considered as advantageous to the growers or purchasers of corn. The first cannot get his commodity disposed of at home, hence willingly goes a stage to meet his merchant; and the latter being sure to meet with a supply, attends upon market day, with his horses and carts, for conveying it to the place where he is to use it, or dispose of it again. By this mode no time is lost, no unnecessary labour incurred; whereas, were all the grain in the kingdom to be sold in the public market, as some wild imaginations recently proposed, a great waste of both must necessarily happen. Let us just suppose, that such a law had been passed, and that the grain sold at Knaresborough was not to be drove to the west bounds of the riding, but that it was wholly to be consumed in the neighbourhood of that place; and say where would be the advantage arising from setting down the sacks in the market? It might happen that a baker or maltster purchased the very wheat or barley which was grown by his next door neighbour, but which, in consequence of such mistaken law, could not be sold without being first offered to sale in this public manner. Would not the trouble of driving it to market by the farmer, and of driving it back again by the baker or maltster, be just so much lost labour to them, without affording the smallest advantage, nay, rather occasioning a positive loss to the public consumer, upon whom every expence of this kind must necessarily fall in the end?" And Mr. Donaldson very justly concludes on the subject of grain, from what has happened in the scarcities of this article in France during the administration of M. Neckar, and more recently in this country, that "while every person must agree, that the regulation of the public markets of the country falls naturally and properly under the direction of the legislature, it is believed there are none who suppose that, during an impending scarcity in this island, it is either a prudent measure, or one likely to alleviate the evil, that the servants of the crown should become the national importers. The unfettered speculations of the merchant are the only resource to be depended upon, under such circumstances, for an abundant supply of the markets. See *CORN LAWS*, and *BOUNTY*."

Mr. Middleton remarks, in respect to the causes that increase the price of animal food in the markets, that "a scarcity of vegetable food for the fattening of cattle, from whatever cause it may arise, whether from a drouthy summer, or a severe winter, uniformly produces full markets, and a consequent fall in the price of the cattle thus prematurely forced to them;" but that "this temporary great supply and low price is, as certainly, quickly followed by a corresponding dearth of fat cattle, and considerable advance in the price of animal food. This circumstance, therefore, though it first lowers the price to below, and then advances it to above par, has a tendency, *on the whole*, to

Vol. XXII.

augment the prices, because, at such a time, the beasts and sheep are sent to market with much less beef and mutton on their bones than they ought to have. Hence a dry burning summer glutts the market with cattle less than half fat; four or five months later the markets are very thinly supplied, and then, of course, the prices rise to an extraordinary height. Every sudden and great advance in the rate of animal food may primarily be traced to this cause. There are, of course, other causes which tend to produce this effect, but they are of slow operation; such as the increasing prosperity and opulence, which enables a greater number of individuals to live on butcher's meat than formerly; while, in the opinion of some people, the present war has greatly increased the number of persons who subsist principally on animal food. But that a prosperous peace would have advanced the price much more, by means of general industry, and the consequent increase of wealth, by such means.

Mr. Marshall, in his excellent work on the landed property of England, states, that "when we consider how much the value of farm lands depends on their locality with respect to markets, it becomes an object of high importance to their proprietors to meliorate their situation in this respect. And he suggests, that there are three methods of improving the value of them in what respects markets, as by the facilitating the conveyance of the produce to distant markets; through the means of roads, railways, or water-carriage; by establishing new markets, in situations where inhabitants have increased, since the establishment of those which are now frequented; and by an artificial increase of inhabitants; by drawing together the consumers of produce; by encouraging manufactures upon, or in the vicinity of them. For while a manufactory continues to flourish, the value of the lands around it cannot fail to be increased." But that, "before an adventurous scheme of this kind can be prudently carried into effect, the evil as well as the good which it may bring to the estate requires to be calculated. A populous manufactory, even while it flourishes, operates mischievously in an agricultural district: by propagating habits of extravagance and immorality among the lower order of tenantry; as well as by rendering farm-labourers and servants dissatisfied with their condition in life. And the more it flourishes, and the higher the wages it pays, the more mischievous it becomes in this respect. Moreover, lands bear a rental value in proportion to the rate of living, in the district in which they lie; so that while a temporary advantage is reaped by an increased price of market produce, the foundation of a permanent disadvantage is laid. And whenever the manufactory declines, the lands of its neighbourhood have not only its vices and extravagance entailed upon them; but have the vicious, extravagant, helpless manufacturers themselves to provide for. This, however, only applies to particular kinds of manufactories." In this country, we have "instances of manufactories being highly beneficial to agriculture. The linen manufactory of Yorkshire, and the woollen manufactory of Devonshire are so; and have been so during a length of time. And "the most intimate connection between them is, where the grower manufactures his own produce. And this pristine connection is still found in the island. In North Wales, the character or callings of sheep-farmer and woollen manufacturer are joined in the same person. The wool is carded and spun, and the yarn woven, under the roof of the grower. If the farmer himself does not throw the shuttle, he employs a labourer or labourers, who assist alternately, and, as the seasons or circumstances require, in the works of agriculture and manufacture." And that "a similar kind of reciprocal benefit

M A R K E T.

arises from the cotton manufactures of this country, where not only the spinners, but the weavers, assist occasionally in the works of husbandry;—in weeding, hay-making, and harvest-works: an advantage which, in an hazardous season, is at once a private and a public good. And add to this another advantage of village manufacturers. When, in the uncertainty of commercial concerns, the demand flags for a time, the country finds, that, instead of having a load of enfeebled artificers, mere manufacturers, to support in idleness, it thereby acquires an additional supply of useful hands, enured to the works of the field, to forward its cultivation, and assist in its improvements. While at all times the increase of inhabitants which this valuable species of manufactory supplies, increases the demand for marketable produce in the immediate neighbourhood of its growth." This can, however, only be the case of a few instances, as manufacturing labourers are seldom useful for farm-business. This is much the case in Lancashire, and other large manufacturing districts.

In the Rural Economy of the Midland District, it is stated, "that markets ought to be adapted to the mutual advantage of the producers and consumers at large, but particularly to those of the peculiar town or neighbourhood. And, therefore, that hucksters may be injurious to such markets, both by being too freely admitted, as well as by being wholly excluded, as mere market towns mostly depend for their supplies upon the market day, when, in a time of scarcity, such dealers may in a very short time clear the market, and leave the inhabitants destitute of the week's provisions; while, on the contrary, when totally precluded from even purchasing the surplus, the market itself, as well as the inhabitants, must be injured, as the producer will, of course, endeavour to find another market where he can sell his produce with certainty, without the risk of having it to bring home again, or disposing of it at an under price to the monopolizers of the town; in consequence of which, the market becomes indifferently supplied, and the articles of inferior quality and more expensive." It would, therefore, it is supposed, be a regulation of great utility, as has been found in actual practice in this district, for the market to open at a stated time, and to permit no huckster to become a buyer till an hour afterwards; as by such means the inhabitants are certain of a supply, without the market sustaining any injury. And Mr. Middleton states, in his Report of the State of Agriculture in the County of Middlesex, that, "in regard to the markets, there are in the country part of the district nine weekly ones held, namely, at Barnet, on Monday morning; at Brentford, on Tuesday; at Southall and Finchley, on Wednesday; at Uxbridge, Hounslow, and Edgware, on Thursday; at Staines, on Friday; and at Enfield on Saturday. That at Uxbridge market a great deal of corn is sold, and there is a large public granary over the market-place, for the purpose of depositing it from one week to another. And at Hounslow market there is a considerable show of fat cattle; such of which as are not disposed of there are sent on to Smithfield-market, in the city of London, which is famous for the sale of bullocks, sheep, lambs, calves, and hogs, every Monday; and again, though in a less degree, on Friday. On the latter day there is also a market for ordinary horses." And "that this is the only public market within the bills of mortality for the sale of live cattle." He gives the following statement of the number of black, or neat cattle, and sheep, annually brought for sale to this market, from the year 1731 to 1795, being 63 years, which he has divided into seven averages of nine years each, namely,

Years.	Cattle.	Sheep.
1732	76,210	514,700
1733	80,169	555,050
1734	78,810	566,919

The writer, however, "has not been able to procure an account of the number brought to Smithfield in 1795 and 6, but he is pretty sure it must be greater than that of the preceding year, on account of the unusual advance in the price of animal food having occasioned a very large quantity of lean cattle to be prematurely sent to market." But "in the above account it may be seen, that the supply has been advancing with some degree of regularity both in the number of cattle and sheep during the last forty-five years. The number of cattle now sent to market is more, by 26,881, than it was twenty-five years ago; and of sheep 147,565. And as it is a matter of general notoriety, that the cattle and sheep of England have also been gradually and progressively increasing in their individual weight, owing partly to the attention paid of late years to the improvement of the breed, and partly to their being much better fed now than formerly, and indeed much better than they could possibly have been before the introduction of turnips and clover; it is not perhaps an unreasonable, or unfounded conjecture, to suppose that the increase, in point of weight, has kept pace with the advance in respect to numbers, during the aforesaid period. If so, it will follow," it is conceived, "that, including number and weight, the annual increase in forty-five years is, in neat cattle, upwards of 72 per cent. and in sheep near 53. Upon the whole, he can safely affirm, that including all the other supplies of animal food, and considering that they also, as well as cattle and sheep, come to market much better fed, and consequently much increased in weight, above what they were forty-five years ago, the consumption of the metropolis is at this time full one-half more than it was then." And since this last period the increase has gone on in a progressive manner.

The following is given as a comparison between the weight of bullocks, &c. as it was one hundred years ago, and as it is at the present time, viz.

Animals.	100 years ago.	Now, close of 1794.
Bullocks, average, weight of	370 lbs.	800 lbs.
Calves, ditto	50	140
Sheep, ditto	28	80
Lambs, ditto	18	50

It is therefore concluded, that at the end of the above year the annual consumption of London was somewhere about 110,000 head of neat cattle and 777,000 sheep: and "that any person, possessing some degree of judgment in cattle, and at the same time the desire of looking at a great variety of live stock, cannot perhaps spend a few hours more satisfactorily, than in examining the market at Smithfield. He will there very soon discover, that, for want of a greater attention to the excellence of breed, both in neat cattle and sheep, a very large proportion of the produce of the soil of this kingdom is wasted in producing bones and offal, instead of meat." It is indeed astonishing, "that men, at least in the present day, should with so much difficulty be prevailed on to breed beef and mutton, in preference to horns, skins, and bones." Since this statement was made much correction in this respect has taken place.

But besides these markets there are others, as Leadenhall-

market, which is the greatest in London, for the sale of country-killed meat, and is the only skin and leather market within the bills of mortality: and Newgate-market, which is the second great place for country-killed meat; and at both these markets pigs and poultry killed in the country are sold, together with fresh butter, eggs, &c. to an astonishing amount. These last and many other markets are held daily, and almost constantly well supplied with most sorts of animal food, &c.

And "the three markets of Smithfield, Newgate, and Leadenhall, supply the butchers round London almost entirely, and to the distance of twelve miles; partly indeed to twenty miles. It is a general opinion among the butchers, that they can buy live cattle in Smithfield cheaper than at any other place. The cattle exposed for sale at this market have been drove until they are empty, weary, wasted, and foot-fore, and consequently shew to a great disadvantage; so much so, that graziers who have followed their cattle, especially sheep, to Smithfield, frequently do not know their own stock, and when they have been shewn to them, they were shocked at their deteriorated appearance. If they should not then be sold and slaughtered, the wasting would continue so much, that it would require several weeks of rich food to raise them to their former fatness." And "the bullocks and sheep drove to these markets are not only over-heated by the journey, but they are also often most savagely beaten with bludgeons, goaded with darts, and hocked about their legs in the market during, perhaps, ten hours, and then drove to the slaughter-house (if they have the good luck to escape thieves in the characters of bullock-hunters), and knocked down while their blood is yet in that inflamed state, and their flesh bruised. Such meat must, it is conceived, be very detrimental to the health and longevity of man. Much better is that which is killed in the country without driving, when the animal is in full health, and sent to Newgate and Leadenhall in clean and cool packages. If this could be done by all, it would remove a great nuisance from London, would probably improve the health of its inhabitants, and certainly prevent many, and sometimes fatal, accidents." Besides, there is a fish-market, which is held every morning at Billingsgate, where all the dealers are served very early: first, those who keep shops in various parts of the town; and next, the hawkers, who, during the forenoon, cry them through the streets. This market receives a considerable portion of its supply of fresh fish by land-carriage, from every distance within the limits of England and parts of Wales. Much is also brought from the sea up the Thames in boats, some even from Norway and Newfoundland, as well as intermediate distances, packed up in ice. The quantity of dried and pickled salmon, of cod, herrings, and shell-fish, is also very great. The whole, probably, amounts to about one-sixteenth of the beef and mutton.

And there is likewise one corn-market, which is held at the corn-exchange, in Mark-lane, principally every Monday, but in a less degree every Wednesday and Friday. In this market an immense quantity of grain is disposed of, but no statement of the exact amount has been hitherto given. The whole seems a sort of monopoly of a most important and necessary article, which should not, by any means, be suffered to continue.

And in addition to these there are also three public markets for hay and straw in this county, namely, Whitechapel, Smithfield, and St. James's; all of which are held every Tuesday, Thursday, and Saturday. And London is likewise in part supplied with the same articles from a market held every Monday, Wednesday, and Friday, in Southwark

And "the barracks on Hounslow-heath furnish a ready market to the farmers in that neighbourhood for their hay, straw, and oats, as well as a fund from which to obtain a supply of manure. In this neighbourhood, some farmers sell their hay and straw to jobbers, who take it at the barn door, alter the weight of the trusses, draw it away in their carts, and re-sell it." In these markets "hay is all fold by the load of 36 trusses, each truss weighing 56 lbs. except new hay which weighs 60 lbs. till the 4th day of September, and afterwards 56 lbs. only; by which regulation a load of new hay, till the 4th of September, yearly, weighs a ton, and after that day only 18 cwt. It is fold daily in large quantities at the different hay-markets, and a regular book kept by the clerk of each market, for the inspection of the public, mentioning the names of the feller, the buyer, the salesman, and the price of each load. This seems to have been intended to secure a fair and honest dealing; but it fails, almost entirely, in effecting so good a purpose; great impositions being practised.

"The best meadow hay, is principally bought for the feeding of gentlemen's saddle and coach horses at from four to six guineas *per* load; the more ordinary, by the livery-stable keepers, coach-masters, and retailers, at from three to five guineas. And the hay of rye-grass and clover, mixed, is generally bought by coach-masters, &c. for ordinary draught horses. The sainfoin and clover hay is generally bought for the brewers, distillers, and carmen's horses, for the rack, and for cutting into chaff, at from five to six guineas and a half the load.

The straw from different kinds of grain brought to the London markets, is likewise fold by the load, which consists of 36 trusses, of 36 lbs. each. Wheat straw is generally used in the stables, for bedding of horses. The rye straw is used by brick-makers, to cover their bricks, by collar-makers, and for packing. The barley straw for packing, and by gardeners. The oat straw is also used for packing, and the winter support of cattle, as saddle horses in straw yards, &c. The bean straw serves to litter farm-yards, and farmer's stables. And the pea straw and tare straw to feed farmers' horses in the stables, and saddle-horses in straw-yards. There are the same regulations at the different markets with respect to straw as hay, and the price of each sort for some time past, has been from 25s. to 45s. *per* load of 11½ cwt. and 9 lbs. It has been lately considerably higher in general.

The coal-exchange or market is in Thames-street, "where the dealers buy and sell. But the consumers are not permitted to buy there, owing to the dealers having obtained a completely infamous monopoly of the market. The annual quantity sold is about 600,000 chaldrons. A chaldron of coals, as delivered to the consumer, is thirty-six heaped bushels, but it is much larger measure between the ship owner and the dealer, and even to such consumers as buy five or more chaldrons at a time; an allowance is then made in the term *ingrain*, which increases the chaldron to full forty bushels."

It must be extremely evident that the due regulation and establishment of suitable and convenient markets must be of the greatest importance to the success and improvement of the agriculture of the kingdom, as by such means a proper stimulus or encouragement can only be held out to the farmer to extend his means of cultivation. The inconvenience of the want of markets, may in many instances be considerably lessened by the forming of canals and the constructing of railways. See CANAL and RAILWAY.

MARKET Bosworth. See BOSWORTH.

MARKET Deeping. See DEEPING.

MARKET Harborough. See HARBOROUGH

MARKET Hill, a post-town of the county of Armagh, Ireland. It is a thriving town, the neighbourhood of which may be considered as classical ground. Gosford castle, the residence of sir A. Acheron, the friend of Swift, (whose descendant is now lord Gosford,) adjoins the town, and near this is Draper's hill, a name given to a farm taken by the dean, on which he intended to build, and which was so called that

"When none the *Draper's* praise shall sing,
His signs aloft no longer Iwing;
His famous letters made waste paper,
This hill may keep the name of *DRAPER*;
In spite of envy flourish still,
And *DRAPER'S* vie with *COOPER'S* hill." Swift.

Market hill is 58 miles N. by W. from Dublin.

MARKET Lavington. See LAVINGTON, *East*.

MARKET Raisin. See RAISIN.

MARKET Weighton. See WEIGHTON.

MARKHL, a town of Bavaria; seven miles N. of Burkhaußen.

MARKING-YARN, in ships of war, is white yarn spun the wrong way, and put into all cordage of three inches and upwards, as the king's work. Blank. Nav. Expof. p. 103.

MARKLAND, JEREMIAH, in *Biography*, a learned critic, son of the Rev. Ralph Markland, known as author of a work entitled "The Art of Shooting Flying," was born in 1693. He received his early education in Christ's hospital, from whence he was elected to Peter-house, Cambridge, of which, in due time, he became a fellow, and a tutor, but refused to enter into holy orders. He lived much in retirement, and his course is distinguished by few events. In the year 1743 he resided at Twyford, and in the following year he went to Uckfield in Suffex, where he resided till 1752, when he removed to a farm-house at Milton near Dorking, in which he lived till his death in 1776, when he had attained to the great age of eighty-three. He shunned company, and was seldom seen beyond his garden. His circumstances were narrow, but his heart was liberal, and his hand at all times ready to afford assistance to the needy, to the utmost extent of his means. By espousing the cause of an oppressed widow with whom he lodged at Milton, he involved himself in an expensive lawsuit, which reduced him almost to indigence. His works are as follow: "Epistola Critica," addressed to bishop Hare, and published in 1723. In 1728 he published an edition of the "Sylvæ" of Statius; and in 1740 "Notes on Maximus Tyrius," which are said to have done great credit to his critical powers. He displayed great sagacity likewise in his "Remarks on the Epistles of Cicero to Brutus; with a dissertation upon four orations ascribed to Cicero." In 1761 he published an excellent grammatical tract "De Græcorum quinta declinatione imparisylabica, et inde formata Latinorum tertia," which was annexed to an edition of the "Supplices Mulieres" of Euripides; published in 1763, and reprinted in 1775. He assisted Dr. Taylor in his editions of *Lycias* and *Demosthenes*; Dr. Musgrave in his *Hippolytus*, and Mr. Bowyer in an edition of *Sophocles*, and also in his conjectures on the New Testament, in which the passages illustrated by this critic are marked with an R. Gen. Biog.

MARKOV, in *Geography*, a small island of Russia, in the Frozen sea. N. lat. 71° 50'. E. long. 138° 14'.

MARKOVO, a town of Russia, in the government of Irkutsk; 56 miles S.W. of Kirensk.

MARKOW, a town of Lithuania, in the palatinate of Wilna; 60 miles E.S.E. of Wilna.

MARKOWISKA, a town of Poland, in Volhynia; 24 miles E. of Lucko.

MARKOWITZ, a town of Moravia, in the circle of Olmutz; 18 miles S. of Olmutz.

MARKS, LAKE OF, called also *Shikkah el Low-deah*, a large lake of Africa in Biledulgerid, reaching near 60 miles from E. to W. and about 18 miles broad, interspersed with several small islands, one of which, however, is large, and though uninhabited, well stocked with date trees. These trees are, by a fabulous tradition of the Arabs, ascribed to the stones of dates, which the Egyptians brought with them for sustenance, when they invaded this country; whence the circumjacent territory is denominated "Babyra Pharaoune," or the Plains of Pharaoh. The situation of this lake, with regard to the sea, the Syrtes, and the river Triton, has induced some writers to take it for the "Palus Tritonis" of the ancients, and to consider the above-mentioned island as the Cherfoneus of Diodorus Siculus and the Phla of Herodotus. Moreover, Pallas, who, with Libyan women, attended Sesostris in his Asiatic expedition, and who was supposed to have owed her origin to this lake, might have resided in this island. N. lat. 33° 50'. E. long. 8° 50'.

MARKT BIBART, a town of the duchy of Wurzburg; 24 miles S.W. of Bamberg.

MARKT Hobenluben, a town of Saxony, in the county of Reufs; eight miles N.W. of Greitz.

MARKT Offingen, a town of Bavaria, in the principality of Oettingen Wallerstein; eight miles W.S.W. of Oettingen.

MARKT Einersheim, a town of Germany, in the lordship of Limburg; 16 miles E.S.E. of Wurzburg.

MARKTL, a town of Austria, on the Trafen; 12 miles S. of St. Polten.

MARKUTCHOE, a town of Bengal; 42 miles N.N.E. of Ramgur.

MARKUWKA, a town of Poland, in the palatinate of Braclaw; 36 miles S.E. of Braclaw.

MARKWOTIZ, a town of Bohemia, in the circle of Boleslaw; 12 miles E. of Jung Buntzel.

MARLBOROUGH, a market town and borough, consisting of two parishes, situated in the hundred of Selkey, and county of Wilts, England. Its name is supposed to be descriptive of its position; being seated at the foot of a chalk hill, the term marle having been anciently used to denote that earth, as well as the peculiar species of clay, to which it is now distinctively applied. The origin of this town is wholly involved in obscurity, for the opinion that it was the Roman station, Cunetio, is certainly erroneous. Whether it was known in the time of the Saxons is equally doubtful, as no vestiges of antiquity, calculated to induce such a belief, can at present be discovered; and Domesday-book mentions it in so slight and cursory a manner, that it is impossible to determine from that work any thing concerning its extent or condition. Probably, however, it was then merely a trifling village, and of course did not become of importance till some time after the Norman conquest; when a castle was built, some remains of which are still visible, near the inn originally erected by lord Hertford, and from its situation denominated "the castle." The great mound which appears in the gardens behind this house has been regarded by some as an immense tumulus or barrow, but that idea is successfully combated by Mr. King, who shews it to have been the foundation of the principal keep of the castle; such works being found to constitute part of the construction of all similar edifices, raised by the early Normans. In the reign of Richard I. this castle was of great strength, and was one of those seized by

his brother John, (who afterwards ascended the English throne,) with the view of obtaining possession of the kingdom during that monarch's unfortunate captivity in Austria. Having failed, however, in his ambitious project, chiefly through the firmness of his mother, he was compelled to fly to the continent, leaving Marlborough castle to be defended by one of his adherents, but after the return of Richard, it was quickly reduced by Hubert, archbishop of Canterbury.

From this period to the year 1267, no transaction of moment seems to have taken place here. In that year, being the 52d of Henry III. a parliament was held in the castle, when a number of laws were enacted for the suppression of tumults, &c. and these acts are still known under the appellation of "the statutes of Marlbridge."

Marlborough was first incorporated by charter in the reign of king John, about the year 1204, but it also claims the privilege of having been a borough by prescription for a century previous to that era. Several other charters have been granted by succeeding monarchs confirming and extending the various rights and immunities of the corporation. The government of the town is confided to a mayor and two justices, assisted by a council, and an indeterminate number of burgessees. The mayor and justices are empowered to hold quarterly sessions of the peace. An annual court for the county is likewise held in the court room over the market place, where are also a council chamber and an assembly room. This edifice stands at the east end of the principal street, which runs from east to west, and constitutes the chief part of the town. The buildings are in general irregular, and present an appearance of great antiquity; some of them being constructed of wood, and having their fronts very curiously carved. Part of one side of this street is adorned with piazzas, which project from the houses forming an agreeable promenade for the inhabitants, and afford them shelter from the effects of rain. At the same end with the market house, or town hall, is the old church of St. Mary. The door way to the belfry is decorated with zigzag ornaments in the Saxon style. The tower is built of free-stone. A plot of ground near this church is supposed, by Dr. Stukeley, to have a strong resemblance to the site of an ancient temple. A short way to the south stood an hospital, or priory, dedicated to St. John the Baptist, and said to have been founded by John Goodwin and William Ramsbeck. The meat market is placed about the middle of this principal street, and on the south side, at some little distance, is a private house, which formerly was part of a priory, belonging to some regular canons of St. Augustine, and conjectured by Gough to have been first erected in the reign of king John. St. Peter's church forms the chief ornament of the west division of the town. It has a lofty square tower surmounted with battlements and pinnacles: the roof is supported by light columns.

The manufactures carried on in this town are comparatively inconsiderable: indeed it may justly be regarded as deriving its main support from its advantageous situation on the high western road, and the consequent extent and superiority of its market, which is held on Saturday, and has been long celebrated for the excellence of its corn, butchers' meat, and cheese. The population, according to the parliamentary returns of 1801, was estimated at 2367 persons, who inhabited 464 houses.

To the south of Marlborough, at the distance of a mile, lies the extensive forest of Savernake, the property of the earl of Ailesbury. This forest contains a vast profusion of noble trees, some of which are exceedingly large and majestic: one, called by way of pre-eminence the *king oak*, overspreads an area of at least 60 yards in diameter. A

variety

variety of charming walks is disposed in different directions, eight of which diverge like rays from a common centre, placed in a spacious opening near the middle of the forest. No natural scenery can be imagined more picturesque or beautiful than that displayed in various parts of this umbrageous district, where the diversity of hill and dale, wood and lawn, frequently presents to the eye of the painter various interesting views.

In this forest stands a modern mansion, called Savernake-*lodge*, appropriated for the temporary residence of lord Bruce, son to the earl of Ailesbury; and immediately adjoining to its eastern boundary is Tottenham-park, the seat of the noble owner himself. The house, a square building of brick, with two wings at each end, stands on the site of the ancient palace of the duke of Somerset, who so much distinguished himself in the cause of the house of Stuart. In the state rooms are several very excellent pictures; and the library contains a very "curious horn, or elephant's tusk in the shape of a horn," which is particularly described in the third volume of the *Archæologia*. Opposite to the north front of the house stands a lofty column, one side bearing an inscription in commemoration of the recovery of his majesty in 1789. The remains of Wolf-hall are the seat of sir John Seymour, whose daughter lady Jane, unhappily for herself, attracted the notice of king Henry VIII., who put to death his former queen Ann Boleyn, and espoused this new favourite, who was destined to suffer the fate of her predecessor. It is said that the marriage was solemnized, and the supper served up in a detached building, which is now used as a barn. The town of Great Bedwin, situated in this neighbourhood, was distinguished as the scene of a battle between Wulfhere, king of Mercia, and Æscuin, a Saxon nobleman, in the year 675. (See *BEDWIN, Great*.) Littlecote-park, which lies on the south bank of the Kennet, about eight miles from Marlborough, would seem, more probably than that town, to have been the position of the Roman station, Cunetio. This suggestion is founded upon the fact, that this spot agrees better with the relative situation in which Cunetio is said by Antoninus to have stood, with regard to Verucio (Heddington) and Spinis (Speen). It further derives support from the circumstance of a Roman tessellated pavement having been discovered within the park which surrounds the house. Here, also, it is known that two Roman ways intersect each other at a point called Cross-ford. The entrenchment named Chisbury-castle, lies somewhat more than two miles to the south-east of this intersection. On Martinsall-hill, at nearly the same distance south of Marlborough, is another extensive fortification. Barbury-castle is placed several miles to the north; and at Avebury are the remains of a very large and singular British structure, which has been already described under that article. (See *AVEBURY*.) Britton's *Beauties of Wiltshire*, vol. ii.

MARLBOROUGH, a township of America, in Grenville county, Upper Canada, north of Oxford, watered by the Radeau.—Also, a district on the Great Pedee river, South Carolina; 25 miles long and 19 broad.—Also, a post-town, both ancient and wealthy, in Middlesex county, Massachusetts, (the "Okommakamest" of the Indians,) incorporated in 1660, and containing 1735 inhabitants; 28 miles W. of Boston. A mode of manufacturing Spanish brown, from a kind of earth or loam resembling bed ore, but not impregnated with particles of iron, has been lately discovered in this town.—Also, a post-town in Windham county, Vermont, containing, in 1790, 629 inhabitants.—Also, a post-town in New Hampshire, incorporated in 1776, and containing 1185 inhabitants; 26 miles from Ash-

burnham, in Massachusetts.—Also, the name of three townships in Pennsylvania, the one in Marlborough county, and East and West Marlborough in Chester county.

MARLBOROUGH, New, a township of Berkshire county, Massachusetts, on the Connecticut line, containing 1848 inhabitants; incorporated in 1759; 135 miles W. of Boston.—Also, a township in Ulster county, New York, on the west side of Hudson's river, north of Newburgh; containing 1848 inhabitants.

MARLBOROUGH, Lower, a town of Maryland, in Calvert county, on the east side of Patuxent river; 24 miles S.E. of Washington; containing about 60 houses. The river is navigable for some miles above the town for ships of burthen.

MARLBOROUGH, Upper, the chief town of Prince George's county, in Maryland, on the south-west side of Hatavist, one of the two chief branches of Patuxent river, containing about 120 houses; 47 miles S.S.W. of Baltimore.

MARLE, in *Mineralogy*, an intimate mixture of lime and clay, which having all the characters of a simple fossil, is properly considered as an object of oryctognosy. It is, by Werner and most other mineralogists, subdivided into 1. Earthy, and 2. Indurated marle.

1. *Earthy marle*; *Erdiger mergel*, Wern.; *Mergel-erde*, Wiedenm. &c.; *Marne terreuse*, Broch.; *Mergel-lera*, aut. Suec.

Its colour is yellowish-grey, passing sometimes into isabel yellow; also greyish and yellowish-white. On the whole it may be said that its colours are lighter than those of the indurated marle. It is composed of dull dust-like particles, either loose or cohering, which soil a little, and are rather rough and meagre to the feel.

Spec. grav. 1.600—2.400, Kirwan.

It is found in Thuringia, near Eisleben, and Sangerhausen; also in Austria, near Vienna; in Bohemia and Salzburg; in Denmark, on Dronninggard, in Zealand, as also on Fühnen, in Jutland, &c.

It occurs as strata in stetz limestone and in sandstone, sometimes immediately under the vegetable earth.

The earthy and the indurated marles pass into each other; and the former is considered by many mineralogists as the product of decomposition of the latter: but the earthy kind is not always found accompanied with the indurated.

In Thuringia it is known under the name of the *Aschengebirge*.

2. *Indurated marle*; *Verhärteter mergel*, Wern.; *Argile calcarifere ou marne*, Haüy; *Steen-mergel*, Swed.

It is mostly smoke-grey, blueish and yellowish-grey, and presents in general all the colours of common compact limestone. It occurs massive, and sometimes, according to some authors, also in supposititious crystals of cubic and pyramidal forms.

Internally dull, sometimes glimmering, which is generally owing to admixed particles of sand or mica.

Fracture sometimes earthy, passing into uneven and splintery; sometimes slaty, particularly in those kinds that have but a small proportion of clay. Fragments indeterminately angular, blunt-edged, and sometimes laminar or slaty. It is generally without distinct separation, but also exhibits imperfectly cubic or columnar and globular concretions; which latter are sometimes composed of concentric layers.

It is opaque, sometimes faintly translucent at the edges of thin fragments.

It is soft enough to yield to the nail; streak greyish-white.

Not particularly brittle; easily frangible.

Spec. grav. 2.300—2.700, Kirwan.

The chemical and physical characters of marle (which, according as lime or clay preponderates, receives the name of calcareous or argillaceous marle) are the following: 1. When fresh it effervesces briskly with all acids; but the argillaceous marle with greatly predominating clay, is often very little affected by acids. 2. After burning it ceases to effervesce. 3. The argillaceous marle is apt to harden in the fire: the calcareous marle becomes more friable. 4. All kinds of marle are easily vitrified. 5. When burnt they attract moisture and crumble. 6. They generally feel meagre, and the indurated kind are rough to the feel. When rather greasy to the touch, this property is caused by very minute particles of mica. 7. In the bosom of the earth the marle is always rather moist, especially the argillaceous marle. 8. All sorts of marle, when exposed to the air, crumble sooner or later in proportion to the degree of their solidity; indeed there are some kinds that are not affected in this manner within the space of three or five years; but the generality are found to crumble, within a year or two, into a loose earth ready for use.

The principal localities of indurated marle are; Saxony, Dresden, Wehrau, Meissen, &c.; Austria; Bilin, Luftritz, Meronitz, and several other places of Bohemia; Bavaria; Moravia; the Palatinate; Thuringia; Hefia; England; Italy; France; and other countries where the fletz-trapp and coal formations occur.

It is chiefly found subordinate to fletz limestone, in which it sometimes forms considerable beds, alternating with compact limestone; it also occurs in coal countries, sometimes in entire beds; and it constitutes the cement of some sandstones. The circumstances under which it occurs in the fletz-trapp formation, have not yet been ascertained. That in Bohemia it passes into basalt, as has been affirmed by Reufs, is doubted by other mineralogists; but a transition of marle into limestone on one side, and into indurated clay on the other, is far from being a rare occurrence.

Indurated marle often contains iron pyrites, garnets (that of the Hiffelberg, at Meronitz, in Bohemia), copper azure, malachite (that of Thalitter), &c. Nor are petrifications less frequently observed in it, such as gryphitæ, belemnites, pectinites, chamites, ammonites, &c.; and sometimes also vegetable impressions.

A remarkable and beautiful variety of indurated marle, which by some writers is considered as a kind of compact limestone, is that known under the name of *Florence marble*, or *Ruin marble*, of which the following description is given by Brard. It presents angular figures of a yellowish-brown, on a base of a lighter tint, and which passes, in diminishing, to a whitish-grey. Seen at a certain distance, slabs of this stone resemble drawings done in bistre. One is amused to observe in it kinds of ruins; there it is a Gothic castle half destroyed, here it presents ruined walls; in another place old bastions; and what still adds to the illusion is, that in these sorts of natural paintings there exists a kind of aerial perspective, which is very sensibly perceived. The lower part, or what forms the first plane, has a warm and bold tone; the second follows it, and weakens as it increases its distance; the third becomes still fainter, while the upper part, agreeing with the first, presents in the distance a whitish zone, which terminates the horizon, then blends itself more and more as it rises, and at length reaches the top, where it sometimes forms, as it were, clouds. But approach close to it, all vanishes immediately, and those pretended figures, which, at a distance, seemed

so well drawn, are converted into irregular spots, which present nothing to the eye. This play of nature is owing to ferruginous infiltrations in the fissures of this marble, which otherwise is of dull fracture and very argillaceous; whence it is never used in architecture; they merely make slabs of it, which are framed like little pictures, and which are much esteemed in commerce when of certain dimensions. It sometimes occurs that the same slab is fawed in two, and the parts are set together in the same frame, so as to appear but as one piece; and the drawings on the right and left bear a resemblance which still further helps the illusion. There are some who, to outdo Nature, put painted figures at the bottom of these pictures; but this is an exuberance of the wonderful, which finishes by spoiling all.

Mr. Brard should have also mentioned the variety of the same Florentine marble, which, instead of the ruins, exhibits fine black dendritæ, arranged in such a manner as to represent, in the most deceptive manner, groups of trees, shrubs, &c. This is called *Landscape marble*.

To this indurated marle must also be referred the fine variety called *Cottam marble*, from being found at Cottam, near Bristol. It resembles, in many respects, the last mentioned variety of Florentine marble; its ground is ash-coloured or blueish-grey, with blackish-brown spots and veins, most of which have a dendritic form, representing assemblages of shrubs and trees, grottoes, &c. It is found in large oblong pieces.

The singular balls, known by the name of *Ludus Helmontii*, belong likewise to indurated marle. They are of various sizes, from one inch to nearly one foot and a half in diameter, and generally disposed in a regular manner in beds of marle. When broken in a direction parallel to one of the largest surfaces, their interior exhibits a number of fissures by which the whole mass is divided into perfectly distinct, and more or less regular prisms of from three to six or more sides; the fissures themselves being sometimes empty, but oftener filled up with another substance, which is generally granular limestone in a crystalline state. There can be no doubt that the singular conformation of the interior of these balls is the result of a kind of contraction produced by exsiccation; but it is difficult to account for the regularity of the fissures, their not extending to the surface of the balls, and their being still filled with substances, which it would be most natural to suppose injected from without. These balls are found in almost all countries where marle is not unfrequent. Those of Franconia and of Antwerpen are very regular in their internal structure; but the isle of Sheppey, in the county of Kent, produces the largest and finest of them. They are also found of considerable size, and of a blueish-grey colour, in Derbyshire. Those of Durham are divided into small hexahedral columns of a very regular form and equal size, while the narrow fissures separating the prisms from each other are filled with quartz. When the marle is disengaged from the quartz septa, these latter more or less represent the figure of a honey-comb.

The name of *Ludus Helmontii* is also given to those imitative figures, which solid pieces of indurated marle frequently assume; and which have received several other denominations, such as zingibritæ, or ginger stones, priapolites, &c.

There are also geodes of marle, which generally owe their origin to the decomposition of a nucleus originally lodged in their centre; they are either empty or drused over with crystals mostly of calcareous spar and quartz. They are found in Milan, and in various parts of France.

Use.—Some kinds of marle that contain but a small proportion

M A R L E.

portion of lime have been employed in pottery; but the most important use of marle in general is in agriculture.

MARLE, or *Marl*, in *Agriculture*, a soft, unctuous, heavy substance of the calcareous kind, found extensively in some situations, at different depths under the ground. It is found in different forms in different places, and distinguished, from its appearances, into *shell*, *clay*, and *stone* marle. The first is supposed to have had an animal origin, as being constituted of testaceous matters, in greater or less degrees of fineness, from the slow decomposition and attrition which they have undergone for a succession of ages, intermixed with a portion of earthy substances. This is generally found in such places as have at some time been covered with water, consequently are more or less pure, and contain greater or smaller proportions of the calcareous principle, according to the differences in the nature of the depositions of the muddy or other earthy matters, with which they are blended by the sediments of such waters. But in common they are found to contain a larger proportion than the ordinary kinds of lime.

In respect to the second sort, it has, in general, a large quantity of clay in union with the calcareous material; on which account, it has a greater power of absorbing and retaining moisture than most of the other sorts. Marle of this nature varies greatly in regard to its colour, being found of a brown, blue, red, and yellowish appearance. And the third sort is met with combined with sand, in different proportions to the calcareous and clayey materials, upon which the difference in its hardness depends. But when it has a thin, flaky, or laminated structure and appearance, it is termed *slate* marle. On account of the portion of clay that enters into the composition of these marles, they are capable of being softened in a gradual manner, by the operation of water upon them, and at last to fall down into a powdery form. Dr. Ainsley long since remarked, that all marles contained some portion or other of clay, in combination with their calcareous matter; while in lime, it is generally sand that is united with it.

It is stated, on the authority of Dr. Black, in the 21st volume of the "Annals of Agriculture," that "all marles effervesce or raise up frothy bubbles, when acids are applied to them; and as water alone frequently produces the same effects, when poured on dry clay, it may be necessary, in order to guard against mistake, in making trials upon substances suspected to be marles, to let them remain a little time in mixture with water, previous to their being subjected to the test of acids. The best or richest marles being such as contain the largest proportion of calcareous earth, it frequently becomes a matter of importance to farmers to be able to ascertain the quantities, (some being found so poor in this material as to have only a twentieth or thirtieth of their weight,) in order to decide on their advantage in preference to lime, chalk, or other substances to be brought from a distance. A simple and easy method, founded on the knowledge that this earth commonly contains about 40 per cent. of its weight of fixed air or carbonic acid, is proposed by the professor. It is merely by saturating the marle with muriatic, or some other acid, and marking correctly the loss of weight which it sustains by the extrication of the fixed air. Thus, if two hundred grains of marle be introduced into a vessel with a little water, and muriatic acid poured upon them until the bubbles cease to rise, the loss of weight being then found to amount to forty grains, the marle contains one hundred grains of calcareous earth. The proportion of calcareous earth contained in different marles may also be determined by dissolving it by means of

the muriatic acid, diluting the liquor with water, passing it through a filtering paper, and then precipitating the calcareous earth from the clear liquid by a solution of some fixed alkaline salt."

And the following simple methods have been suggested by Mr. Donaldson, tending to shew that such substances as are examined are marle; but they are not by any means so correct as the above.

First, by Air.—"If a lump of true stone or clay marle be exposed to the air, it will, in a short time, break into small pieces."

Secondly, by Fire.—"When a piece of real marle is dry, break it into as small particles as possible, and put a handful into a hot coal-fire: it will crackle in the same manner as if salt had been thrown therein."

Thirdly, by Water.—"Put a piece of dried marle into a wine glass, and pour gently as much water thereon as will cover it: if true marle, it will gradually dissolve into a liquid or foamy substance, and at the same time shoot up many sparkles to the surface of the water." But "the most certain criterion, by which to prove marle of all kinds, is to put a little in a wine-glass, and pour over it a small quantity of aquafortis, or some other strong acid: if it effervesce, it is a sufficient proof of its being marle; and the degree of the effervescence, at the same time, ascertains its quality."

It is obvious, however, that these simple, but imperfect, modes should only be had recourse to, when the means of a complete analysis are not capable of being put in execution, for want of proper convenience.

Though there are the above differences in the natural appearances of marles, they agree in being all capable of being reduced into a fine powdery state, by being exposed for some time to the effects of the atmosphere. By this means, they become ultimately capable of being blended minutely with the different materials of the soils upon which they are laid. But as this common property of falling down into powder, in consequence of the absorption of moisture and carbonic acid or fixed air from the surrounding atmosphere, is much greater in some sorts of marle than others, it may afford some difference in their utility when applied to lands as manures. See **MANURE**.

In the Farmer's Magazine, some moss-shell marles are stated to have been found to contain 84 per centum of pure chalk, or carbonat of lime, which is more than lime generally possesses, the refuse being chiefly peaty substances, which is a circumstance, it is said, that makes the refuse of them the more useful as a manure, than that of limestone, which is mostly sand or clay. These marles are also capable of being converted into quick-lime, by burning; and their solutions change vegetable colours to green, possessing all the other properties of caustic lime.

Marle is likewise further distinguished by its feeling fat and unctuous; and its looking, when dry, after having been exposed to the weather for some time, as if it was covered with a hoar-frost, or sprinkled with fine salt, and even when mixed with the land intended to be manured by it, the whole surface having a whitish appearance. The more marles effervesce with acids the more valuable they are as manures. In hot weather, good marle will flake with the heat of the sun like lime; especially when rain follows a hot day or two.

Good marles of different kinds abound in most parts of Lancashire, and are in very extensive use in many places, having been found to answer well in different proportions and different kinds of land. See **MARLING of Land**.

The

The farmers in Staffordshire consider the soft blue marle, which is commonly found under clay, or low black ground, at the depth of seven or eight feet, the best for arable land, and the grey sort the best for pastures. But that which is of a brownish colour, with blue veins in it, and little lumps of chalk or limestone, generally lying under stiff clays, and very hard to dig, is most esteemed in Cheshire. The marle which is usually found at the depth of about two feet, or a yard, on the sides of hills, and in wet boggy grounds, which have a light sand in their composition, is very fat and close, and reckoned the strongest; for which reason it is particularly useful on sandy lands. It is often called *peat-marle* or *delving-marle*. What is sometimes called *paper-marle* frequently lies near coals, and flakes like leaves or pieces of brown paper, being of a somewhat lighter colour. That which some call *clay-marle* is very fat, and sometimes mixed with chalk-stones. There is another sort of marle which breaks of itself into square cubical bits. These two last kinds generally lie under sand or clay; sometimes about a yard deep under the former, but often much deeper under the latter. The stone, slate, or flag marle, which is a kind of soft stone, or rather slate of a blueish colour, is generally allowed very good. It easily breaks down and dissolves with frost or rain, is found near rivers and on the sides of hills, and is a very lasting sort when used as manure.

In a variety of districts of this kingdom marle discovers itself to the most negligent eye; particularly on the sides of broken hills, or deep hollow roads. Many rivers are bordered with a vast treasure of this sort, which is plundered by every flood. Boggy lands frequently cover it; and in them it seldom lies above three feet deep. It is somewhat lower under stiff clays, and marshy level grounds. The lowest parts of most sandy lands abound with it sometimes at the depth of three feet, and sometimes at seven, nine, or more. The depth of the marle itself can seldom be found; for when the upper crust of the earth is removed, all that can be seen or dug, is marle, to so great a depth, that there are few if any instances of a pit's having been exhausted of it.

But the manner in which this earthy material is found, is probably different in different sorts and situations.

In the Perthshire Report, shell-marle is stated to be found for the most part in small lakes, or in land-locked bogs and mosses, where there had been formerly a lake or pond, during the multiplication of the animals. The wilks, which produce the marle, it is said, live only one year, and multiply prodigiously. They are often found to adhere to the long grass, which grows in pools, where they breed; and when the grass decays, it is laid in horizontal lamina on the marle bed, by the weight of the animals. These lamina ascertain the number of years in which the marle bed has been forming, in the same manner as rings of trees denote their age. When the wilks happen to generate in springs or other small collections of water, which are in moors or other high ground, they are frequently carried down in the wet season, to the first still water; but if the stream is not able to carry them to a pond, they are sometimes left in the face of the hills, and form beds of marle in that situation. In Glentilt, a property belonging to the duke of Athol, there is, it is added, marle collected in this manner, on the declivity of a hill, to the depth of thirty feet, which, at a distance, has the appearance of a white rock. And according to some, not only wilks but bivalves produce shell marle. These wilks are of a blackish colour, and about the size of a pea; and are found in rills or springs in the months of May and June, sticking to stones and grass.

VOL. XXII.

Wherever the wilks are observed in lakes, bogs, or meadows, it will be proper to bore for marle; or if they be found in spouty land, or in rills of water that flow into lakes or into marshes that stagnate, it may also be proper to bore for marle in these lakes or stagnant water. Marle is found under most sorts of substances, but more commonly under moss, soft mud, and sand; more rarely under clayey strata.

Discovering of Marle.—This material is commonly sought for and discovered by means of boring with a tool for the purpose, somewhat in the manner employed for coal and other similar substances. A boring rod for this purpose is thus described in the Perthshire Survey. "It is made of iron, in pieces of about four feet long, which screw into each other. In the undermost or first piece is a kind of tube, about two and a half feet long, pointed sharp, open on one side, and one of the edges raised higher than the other, like a gimblet; so that when turned round, it may fill itself with the substance which surrounds it. Into this tube, which is open at the top, is put a piece of wood, as long as the tube itself, and of a conical shape, corresponding exactly to its figure. To this piece of wood is fastened a rope, of the size of one's little finger, and longer than the whole rod when all the pieces are put together. This piece of wood must stick so fast as not to come out, when the rod is pushed down into the earth or moss, below which marle is expected to be found; but must not be so firmly fastened, as not to be easily drawn out by the rope to which it is fixed." When it is wished to bore, the piece of wood is put into the tube; screwing "the piece of the rod which is fitted to the screw on the top of the iron in which the tube is formed; then pushing down the rod into the earth or moss, allowing the rope to go down with the rod, without twisting round it; and when the two first pieces of the rod are pushed down their full length, screw on the upper piece of the rod, which ought to fit the screws of all the other pieces, and must have a hole in the top of it, large enough to admit of a piece of timber, two inches diameter and four feet long, with which you are to turn round the rod three or four times, having previously drawn up with the rope the piece of wood which had been put into the tube. When the tube is thus turned round, it will be filled with the substance next it; and when drawn up, will shew what that substance is. You can bore deeper and deeper, by screwing on more pieces of the rod, below the piece into which the handle is received that turns it round; but for facility in unscrewing, there should be a hole in every piece of the rod, that will admit of a piece of iron, of the thickness of a man's thumb and eighteen inches long. It will be necessary to have two of these pieces of iron, so as to hold the rod steady with the one, while you screw or unscrew any of the pieces with the other; and this must always be done, in putting down and taking up, when a great length of the rod is required, as it cannot be managed in either of these cases, all in one piece." See *BORING Augre*.

Marle is very common in Ireland, where it often lies not above a foot or two below the surface of the soil. But in France, though they have marle in many places, they are often obliged to dig very deep for it. In many districts of this country there are also pits of this sort of great depths. But where the marle lies at such great depths, it can in very few cases be raised for the purposes of manure. In most situations where it is employed in this intention, it is found only a few feet or yards below the surface, and it is usually raised by digging pits, and where there is much water draining them either in the common way, or by the use of pumps. When they are not very deep, the best and

most ready method for getting out the marle is to open a sloping mouth, sinking the pit gradually, wide enough for a cart to drive in and out; and to work the marle away circularly, keeping the pit ten or fifteen feet deep, by which means the expence of filling the carts will be much lessened. And in cases where it is raised from below loughs or ponds, it may sometimes be necessary to have recourse to boats for conveying it to their borders, in order to its being conveyed upon the lands.

In first opening the pits upon the land, it will be necessary that they be made as convenient as possible for carriage and draught, and that the least possible injury be done by them to the grounds. Attention should likewise be paid to the facility of laying them dry. When large pits are dug, masses of considerable size are often let down by undermining, and forcing large piles in above them. In these cases great care should be taken, as they are very apt to give way suddenly, and cause accidents.

Marle is a substance that may be made use of on most sorts of soil, that are of a sufficiently dry quality to admit of its being applied. It has been found highly useful on those of the sandy, gravelly, and moory kind; upon the more heavy sorts it may likewise be found beneficial in many cases, where the calcareous principles are wanting. This would at least seem to be the case with shell-marle, which Dr. Robinson says, of all others, abounds most in his district, containing more oil than any of the other kinds. In common with them, all he supposes pulverizes the soil, and prepares the vegetable food for being absorbed by the roots of plants: in common with them also, it communicates to the soil the power of attracting the fertilizing influence of the air; but it surpasses them, by adding mucilaginous matter of its own to the soil, being the *exuvia* of animals, and thereby increases in no small degree the quantity of vegetable food. Most of the common marles, however, seem to act more in a mechanical manner upon the soils, than by adding any thing of a nutrient principle to them.

In digging for the marle they use in manuring their lands in Ireland, they meet with fossil horns, and other curious fossils. The marle always lies in the bottoms of low bogs. It is never met with in any other places, and is found by boring with augers made for that purpose. It usually lies at five, seven, or nine feet depth. The obtaining it in many places is attended with very considerable expences, in draining off the water. The manner of digging it is this: they employ six able labourers, and a supernumerary; and these cut up a hole of twelve feet square, which is supposed a pit that this number of men can manage in one day. Two men dig, two throw it up, and two throw it by, and the supernumerary man supplies defects on all occasions. For the first three feet they dig through a furzy earth, fit for making of turf or fuel. Under this lies a stratum of gravel, of about half a foot. Under this often, for three feet more, there is a more kindly moss, which would make better fuel. This lower stratum of turf is always full of fossil wood, which is usually so soft, that the spade cuts as easily through it, as through the earth it lies in. Under this, for about three inches, is found a series of leaves, principally of the oak; these appear very fair to the eye, but fall to pieces on touching; and this stratum is sometimes interrupted with vast heaps of seed, which seem to be broom or furze-seed. In some places there appear berries of different kinds; and in others, several pieces of sea-plants, all lying in the same confused manner as the oak-leaves. Under this vegetable stratum there lies one of blue clay, half a foot thick, and usually full of sea-shells. This

blue clay is not so tough as common clay, but is thrown carefully up, and used as marle in some places. Under this always appears the right marle; the stratum of this is usually from two to four feet thick, and sometimes much more. Phil. Trans. N^o 394, p. 122.

This marle looks like buried lime, and is full of shells, which are usually of a small size, and of the perriwinkle kind; but there are several other sorts, at times, found among them. Among this marle, and often at the very bottom of it, are found great numbers of very large horns of the deer-kind, which are vulgarly called elks' horns. These, where they join to the head, are thick and round; and at that joining there grows out a branch, which is about a foot long, and seems to have hung just over the creature's eyes; it grows still round for about a foot above this, and then spreads broad, and terminates in branches, long and round, turning with a small bend.

The labourers are obliged to work in a hurry in all these pits, so that they seldom bring them out whole. There are also at times found the leg-bones, and other parts of the skeletons of the same beasts: but these are more rarely only a few together, and but in few places.

MARLE, in *Gardening*, a sort of fossil earthy substance, which is sometimes made use of for rendering stiff adhesive garden lands more open and light in their qualities.

This material varies much in its nature, some being nearly of the nature of fuller's-earth, and of a fat enriching quality, of which there are blue, grey, yellow, and red coloured; but the blue is esteemed the best in this intention. In other cases, it has the appearance of a kind of soft stone, or rather slate, of a blueish or grey colour, called stone or slate marle, being found commonly near river sides, and the sides of hills, &c. and though hard when dug, easily dissolves by rain and frost. There are likewise calcareous, or shell and clay marles, the latter resembling a fat sort of clay or loam. The last sort is accounted good manure for improving light, loose, sandy, garden lands. See MANURE, and MARLE, in *Agriculture*.

MARLE, in *Geography*, a town of France, in the department of the Aisne, and chief place of a canton, in the district of Laon; 13 miles N.N.E. of Laon. The place contains 1616, and the canton 9967 inhabitants, on a territory of 257½ kilometres, in 23 communes.

MARLE Dice, in *Husbandry*, a name given by the people of Staffordshire to a reddish marle, that breaks into small square pieces like dice, or else into thin flakes, in the manner of lead-ore, and looks smooth on the surface. This is a good manure, and the way of judging which of it is best, is to expose it to the air in rainy weather, or to put it in water. That which moulders soonest to powder in the air, and breaks quickest in the water, is sure to be the best, and proves very beneficial to land.

MARLE-Slate, *Bituminous*;—*Bituminous marlite*, Kirw.; *Bituminöser mergel-schiefer*, Wern.; *Schiste marno-bitumineux*, Broch.; *Koppar skifaver*, Swed.

Its colour is partly greyish, partly brownish-black, and also of an intermediate colour; seldom blueish-black.

Occurs massive, and is frequently marked with impressions of fishes and marine plants.

Fracture slaty (sometimes rather indistinctly so), partly straight, partly undulated slaty.

The planes of separation always shining; the planes of fracture of the straight are slaty, rough, and generally dull, or at best, glimmering; those of the curved slaty are smooth and glistening.

Fragments generally slaty.

Retains its colour in the streak, which is glistening.

It is opaque; soft; rather mild; easily frangible.

In large flat pieces it is rather sonorous.

It is meagre to the feel; and moderately heavy.

Spec. grav. 2.361—2.442, Kirw.

It effervesces with acids. Before the blowpipe it first burns with a small flame, giving out a bituminous odour, and afterwards fuses into a black slag.

It is found at Eisleben, Sangershausen, &c. in Thuringia; at Riegelsdorf, in Hessia; in the county of Mansfeld; in Switzerland, at Aigle and Bex, &c.

The varieties rich in copper are often regularly wrought as ores of this metal: no other use is made of bituminous marle slate, which, when decomposing in the air, forms an earth injurious to vegetation.

Bituminous marle slate is subordinate to the stetz limestone formation, in which beds are sometimes formed by it. Its lowermost stratum, which rests on the old sandstone, is generally rich in copper ores, whence it has received the name of copper slate: these ores are copper pyrites, vitreous copper ore, variegated copper ore, more seldom copper azure, copper green, malachite, and still more rarely native copper. Besides these also some galena and carbonated iron is found in it; and its rifts are sometimes coated with selenite.

In this slate are frequently found the impressions and remains of fishes converted into coal, and which, by the convulsed and contorted attitudes in which they are seen, appear to indicate a sudden catastrophe, by which whole shoals of them perished. Nor is it less singular that impressions of the same species are generally found together. Of this description is, among others, the well known marle slate from Monte Bolca, of which, and the impressions contained in it, a detailed account has been given under the article ICHTHYOLITE. The quantity of fishes in the marle slate of Thuringia, is generally proportionate to the quantity of copper it contains; sometimes the whole of these remains is converted into copper pyrites. In the bituminous marle slate of Richelsdorf, in Hessia, Mr. Ries has discovered some remarkable impressions which he considers as produced by the bones of a child's hand; but, according to professor Blumenbach, the bones belonged to animals of another order of mammalia.

The bituminous marle slate passes into indurated marle; sometimes also into stinkstone.

MARLHEIM, in *Geography*, a town of France, in the department of the Lower Rhine; nine miles W. of Straßburg.

MARLHES, a town of France, in the department of the Rhone and Loire; 10 miles S. of St. Etienne.

MARLIEUX, a town of France, in the department of the Ain; 10 miles S.S.W. of Bourg en Bresse.

MARLINE, on board a *Ship*, is a small line made of hemp untwisted, that it may be the more gentle and pliable: its use is to seize the ends of ropes from farding out. They use it also to seize the straps at the arse (as they call it) or lower end of the block. See **HOUSING**.

MARLING, in *Sea Language*, denotes the art of winding any small line, as marline, spun-yarn, pack-thread, &c. about a rope, so that every turn is secured by a sort of knot, so as to remain fixed in case all the rest should be cut through by friction, &c.

Marline is commonly used to fasten slips of canvas, called parfling or parcelling, upon the surface of a rope, to prevent it from being galled by another rope that rubs against it, to attach the foot of a sail to its bolt-rope, &c.

MARLING a Sail, is when being so ript out of the bolt-rope, that it cannot be sowed in again, the sail is fastened

by a marline, put through the eye-let holes, made in it for that purpose, under the bolt-rope.

MARLING-Spike, is an iron pin, tapered to a point, and furnished with a large round head. It is principally used to penetrate the twists or strands of a rope, in order to introduce the ends of some other through the intervals, in the art of knotting or splicing. It is also used as a lever on any other occasions, about the rigging, particularly in fixing the seizings upon the shrouds, block-trops, clues of the sails, &c. Falconer.

MARLING of Land, in *Agriculture*, the operation of digging up and putting marle or some sort of material of this nature upon the ground, so as to effect its amelioration and improvement. In the application of all sorts of manures, the farmer must be regulated in a great measure by the quality of the soil, and the strength of the manure, in which experience is the surest guide. In marling, it is particularly necessary to find the true proportion which the land requires, and much better to err in laying on too little, than too much, as more may be added at pleasure; whereas by overdoing it, the first year's crop often fails, from the body of the marle not being sufficiently opened; and in that case, it will sometimes be three years before the ground comes to a proper state. The best directions that can be given the farmer in the application of this manure to light soils, is to lay on the quantity which will give the degree of cohesion wanted in those soils. A general rule cannot be laid down in this respect, as the quantity of marle requisite to effect the desired end must be different in proportion to the degree of lightness of the soil. But the quantities most commonly employed are from seventy to eighty loads. In Lancashire they have lately reduced the proportions of the sets, and found them to answer much better than the former larger ones. Upon lands of the sandy kinds, Mr. Young advises from fifty to sixty cubical yards *per acre*; but on those of the loose, wet, loamy sort, upon which this kind of manure produces great improvement, it should, it is suggested, be laid on to the amount of a hundred yards.

And in regard to the most economical method of doing this sort of work, it is, he imagines, that of contracting "for the whole job with some little farmer or horse keeper who works for hire." It is not uncommon in Suffolk to give 8*d.* a cubical yard for all expences whatever, except that of spreading, which those farmers that have attention to correct management do by the day, as it is of much importance to have it well performed; for where this is not the case, some parts of the field will have it in the proportion of two hundred loads, while others have not more than fifty. In the same county even 9*d.* and 10*d.* *per yard*, it is said, has lately been given to such small farmers for teams sufficiently strong for this sort of business.

The practice and success of Mr. Rodwell in this sort of work, as detailed in the second volume of *Communications to the Board*, hold out much encouragement.

On obtaining a lease of a farm, of 1400 acres, at 15*o/*. a-year, of the poor, dry, heathy kind of land, abounding with fern, gorse, and more particularly ling, of little value, and affording only a scanty support to ill fed sheep; his "operations were to inclose with thorn hedges, marle, or clay, and break up 300 acres of the heath; and in the first seven years of the lease he finished what he meant to improve in that term; he marled or clayed 600 acres, at 70 loads an acre, being 42,000 large tumbrel loads. In this work he employed three teams, two of his own, and one he hired, for several years. It is severe work, and the second year he lost nine horses, attributed to feeding on pea

MARLING OF LAND.

straw from the new broken heath, a circumstance that deserves the attention of improvers. In the 11th year of his lease he applied to his landlord for a renewal; on which the farm was valued again, and he took a fresh lease of 15 years to commence at the termination of his old one, at the rent of 400*l.* He immediately clayed and broke up 200 acres more, at 100 loads an acre, 40 bushels *per* load, inclosing all with quick hedges and ditches five feet wide and four deep; after this, he improved 300 acres more in the same manner. In the two leases of 28 years, he clayed or marled 820 acres; and he has clayed or marled so much over the second time, at 70 loads an acre, that the quantity he has carried in all, is very little short of 140,000 loads. Upon taking a third lease, he was, in 1798-9, particularly steady to this work, and in 49 weeks and three days carried 11,275 cubical yards, paying by measure of pits, and not by loads, which were filled and spread by four men and a boy, and carried by six horses and two tumbrils."

And "in this business of carrying clay or marle he has practised hand-barrowing; the men can make good earnings at 10*d.* a yard, wheeling it 30 rod; and down to 7*d.* a yard at shorter distances; and he is much inclined to think, that if we had workmen used to the operation, and handy at it, like those employed in navigations, that this method would be of all others the cheapest, especially on the heavier soils. But by far the greatest part he has done by tumbrils, the expence of which put out is 5*d.* a yard for team, and 2½*d.* a yard for labour, and paying for laying picks, wedges, &c. also for stones that rise, increase the whole expence to 8*d.* *per* yard, which is at least 2½*d.* *per* yard cheaper than he can do it with his own teams: the reason of which is, that the man who contracts with him drives his own horses, and looks after them; at 8½*d.* *per* yard, 140,000 yards have cost him 4958*l.* excepting the small proportion hired at ½*d.* *per* yard lower."

Here a few circumstances are mentioned which he hopes may tend to render this communication useful to others, not having the experience which he has acquired. He says, he shall use but few words, but they shall be founded on positive experiment or attentive observation. Clay is much to be preferred to marle on these sandy soils, some of which are loose, poor, and even a black sand. By clay is to be understood a grey clayey loam, some of it brick earth, and all has with vinegar a small effervescence. Marle is a white, greasy, chalky substance, that effervesces strongly with acids. He makes a universal rule, on a second improvement, to lay clay on the fields marled before, sometimes marle where clay was spread before; but this is not general, as clay answers best on the whole. On 90 acres, clayed 100 loads an acre, he has had after two crops, the one turnips, the other barley, cole-seed, and sold it on the ground for 1000 guineas; then turnips, a famous crop, followed by barley, on 75 acres, 16 coombs an acre; and by oats on 15 acres (poorer land), 10 coombs an acre. These crops are for the soil *great*; but in general his products have been highly to his satisfaction.

It is stated by Mr. Young, that the expence of this sort of work, where it is thrown from the mouths of sloping pits into the carts, will be, "upon an average, three-pence to three-pence halfpenny *per* cubical yard, the filling and spreading, and about four-pence halfpenny for the teams, carts, and drivers; in all eight pence *per* load, or cubical yard, or 3*l.* 6*s.* 8*d.* *per* hundred loads; which will be a proper quantity for an acre of land: the benefit will last for twenty years, and the land always be the better for it."

It is sufficiently obvious, that there must be considerable variations in the expence, from the circumstances of con-

veying it from different distances, as is shewn in the Survey of Lancashire.

The expence of marling upon marsh land, near Liverpool, about the year 1780, is stated as follows:

Expences.	£	s.	d.
Getting and filling, <i>per</i> rod of 64 cubic yards	0	10	0
Spreading	0	2	2
Carting, the average distance from the middle of the pit to the middle of the land, 60 rods	1	9	0
	2	1	2

In this estimate, there were six carts, five in motion, each going the distance of twelve rods, while one stood in the pit to be filled. The size of each cart was 20,736 inches (cubical), usually drawn by three horses; the weight of the load about 15 cwt. and two cubical yards of marle made about three loads. The number of workmen were six fillers and getters; usually two right-handed men at one wheel, and two left-handed at the other, with one filler behind: one getter is generally sufficient for the whole.

Expences.	£	s.	d.
Getting, filling, and spreading, to the acre of 64 yards to the rod, was	3	19	1
Cartage	9	8	0
Digging for the marle, clearing the head, expences at finishing, &c. <i>per</i> acre	2	7	0
	15	14	1

There were about 6½ rods laid upon the acre on this occasion. The men got 2*s.* 6*d.* and the carts 7*s.* 6*d.* *per* day. Getting and filling marle, it is said, is very laborious work, and requires the utmost exertion to obtain these wages; and that this work, after all, can only be effected by young men in their prime, cheered by the company of fellow-labourers, and frequent refreshments. Five working-days are reckoned equal to six at other work, for they usually begin at half-past four in the morning, and rest one hour at breakfast, from eight to nine; rest again from twelve till two, and then work till six; and generally get out nine rods *per* week.

The present price (1795) is—	£	s.	d.
For getting and filling, <i>per</i> rod	0	12	0
Spreading	0	2	6
Carting	1	13	0
	2	7	6

Since this period the expences have been very greatly increased, so as to render marling a very heavy charge to the farmer.

In the Middlesex Report it is stated to be this: "Four men digging and filling eighty cart loads, at 4*s.* a score, spreading included, is 16*s.* One man and four horses, two days, at 12*s.*—1*l.* 4*s.* Total expence *per* acre, 2*l.*"

An intelligent farmer, who has had considerable experience on a farm of twelve hundred acres, remarks, that, "from different trials of his own, at a very great expence, and the observations he has made on his neighbours' and the Norfolk farmers' manner of improving light sandy lands, by clay and marle, he is clearly convinced, that about seventy square yards, each of which contains about a cart load, is the properest quantity to be laid upon an acre of land, pole measure.

MARLING OF LAND.

measure. If more be laid on, the longer it will be before it incorporate with the soil, and, of course, the longer before any benefit can be received from it. He once saw an instance, where a farmer laid 120 loads, or square yards *per* acre, and gave this reason for it, that the land was so poor he was sure he could not hurt it. But the consequence of it was, that after an expence that would have purchased the fee simple of the land, he could not see, for many years, that he had done it any good, as it produced no better (if so good) crops, as land by the side of it that had not been clayed at all, but otherwise farmed the same. It has now, however, evidently the advantage of the other lands, having been done above twenty years. This trial was in the middle of a shiftable field, where, by the course of husbandry, two crops are taken to one summer tith; and where this is the case, claying, &c. seldom (or never he might say) answers the expence; for claying and marling being only a first, or beginning of improvement, by going on directly with a course of ploughing, which cannot well be avoided in shiftable fields, it is often buried and lost before it mix properly with the soil, especially if turned in too deep by the first earth, of which great care should be taken. He would therefore recommend claying or marling only upon inclosed lands, unless where large breadths lie together, that can be farmed in any manner the occupier pleases; and in that case (as well as in inclosures) he would advise that the lands should be laid down with clover, rye-grass, and trefoil, the spring twelvemonth before laying on the clay or marle, and to remain at least six months after it, that it may have time to sink and eat itself into the flag before it is ploughed up, and then there will be little or no danger of losing it, as it will already be in some measure incorporated with the soil." And, "no pains should be spared to break all the lumps, and get it fine by repeated harrowings and rollings, and having all the stones picked and carried away, that the grass may get through as soon as possible, for stock to be grazing upon it, which is the great and finishing improvement; for, as he observed above, claying or marling seldom or never answers where you go on immediately with a course of ploughing in the common way." Besides, "in his opinion, as much, or more, depends on the management of lands after claying or marling, as in the mere laying it on, which, however, is very expensive, and therefore a very persuasive argument in favour of that sort of management that will be the most likely to make it lasting." But "little need be said about the different quality of clay or marle, as every one must be content to use such as is found on his own premises, for he never heard of any in the counties of Norfolk or Suffolk that would answer long carriage. He has seen, however, in the county of Kent, a sort of marle that the Essex farmers buy, which, after being sent many miles by water, he is informed they find answers carrying five or six miles by land. Clay that is freest from sand, and marle that is soft and greasy, are certainly, in his opinion, the most valuable; and even blue clay, that is condemned by most farmers, he has found to answer very well on light sands, but they generally lie at too great a distance from each other to be prudently got together." However, "where there are different sorts of manure equally convenient upon the same premises, which is sometimes the case, *viz.* pure clay, white foamy clay marle, clay with much marle in it, loamy clay and cork; he should certainly prefer the former for light sandy lands; on sands of a stronger nature, that have a mixture of loam with them, he should choose the foamy-marle, or that mixed with clay-marle, whichever was most convenient; but any of the

inferior ones must be used, rather than submit to long carriage, especially on a large scale."

With regard to the expences, "the first is the *filling*, which, including spreading, is 25s. a hundred, or 2½*d.* a load, with an allowance by some farmers of 2s. 6*d.*, by others of 5s. for opening the pit, and 1s. a load for all the large stones they throw out at the time of filling; the farmer to find drifts and flakes for letting down what they call the *falls*." And with respect to "the team, it must consist of four strong trace horses, and two shaft horses, which, for such strong work, must have very high keeping. He cannot, therefore, lay their labour at less than 2s. a day each, and the carter 1s. 6*d.* a day, which, supposing they carry, one day with another (allowing for wet weather and hindrance by accidents, &c.), 30 loads a day, will be about 5½*d.* *per* load more, making in the whole 7¾*d.* a load for filling, carting, and spreading." Therefore, taking the quantity of marle which is necessary on a medium, at 75 loads *per* acre, the statement of the expences of this sort of work will stand thus:

Expences.	£ s. d.
Seventy-five loads, which, at 7¾ <i>d.</i> a load, is, <i>per</i> acre	2 8 5½
Harrowing and rolling several times, to pulverize and spread it equally on the surface, <i>per</i> acre	0 1 6
Wear and tear of carts and harness, including accidents, at a farthing <i>per</i> load, <i>per</i> acre	0 1 6½
Loss of seed, as it should always be laid upon a layer, and be some months before it is ploughed in, <i>per</i> acre	0 1 0
	2 12 5½

See Annals of Agriculture.

A late author states, that "in Lancashire they have abundance both of stone and clay marle: the former is applied to the strong clay soils, the latter to the light, loamy, and sandy lands. The medium quantity laid on the acre is about three cubic roods, of eight yards to the rood. The expence in a great measure depends on the distance of carriage; but generally runs between six and ten pounds the acre. It is commonly laid on grass lands, a year or two before they are broken up, although sometimes on lands in a course of tillage. In either case, great care is taken to spread it as equally as possible on the surface, and to break any lumps on which the weather has not had sufficient influence." And "the application of clay-marle to the light sandy soils in Suffolk, has been the means of greatly improving those soils; and the crops which they produce, after being marled, if the lands be not too severely cropped, are so superior, as fully to warrant the expence. The quantity laid on the acre is about eight loads, or nearly 2500 bushels; this has been fully shewn above. And in the Isle of Man, they lay on clay marle at the rate of nearly two hundred tons the acre."

But "it is to the county of Norfolk that we are to look for the wonderful effects produced by marle. There are so great, that lands which, forty or fifty years ago, did not rent at eighteen pence the acre, now give upwards of twenty shillings. There are two kinds of marle in that county; the one of a white, or rather yellow colour, consisting almost entirely of calcareous earth; the other may properly be denominated clay marle, but from the small quantity applied to the acre, it must be of a very rich quality, compared

MARLING OF LAND.

to other marles; otherwise it could not operate so powerfully on the soil. Of the first, from ten to fourteen loads are sufficient for the acre; and of the last, from thirty to forty. The mode of application varies. Sometimes it is used as a preparation for a crop of barley, or turnip; and is frequently laid on clover-ley, before being broken up for wheat; its use in this district will be more fully seen below."

Yet it is suggested that, "if the above county has been benefited by the marles above-mentioned, that of Forfar, in Scotland, has reaped as great advantages from shell-marle. Shell-marle, of a most excellent quality, has been for a good many years discovered in various parts of that county, and the improvements that have taken place, in consequence of the general and judicious use of that valuable manure, exceed perhaps any thing of the kind that ever happened in the same period in any other county in the kingdom. The average quantity laid on the acre, is about four hundred cubic feet; and in respect to the mode of application, it is in every respect similar to that mentioned above, as the practice in Norfolk. Great caution is, he thinks, necessary in using marle, and in adopting proper rotations of cropping after it is applied. If a large quantity be laid on at once, especially on light lands, or if the marle be laid on a second time in the course of a few years, and a number of severe crops afterwards taken, the lands will be greatly exhausted. This was experienced in many instances, when marle was first used as manure in Forfarshire; the tenants, for the most part, ignorant of the effects it would produce, laid on large quantities; which creating a great fertility, they went on sowing oats, and other severe crops, till the soil became little better than a dead substance. This alarmed the proprietors, and induced them to include certain covenants in their leases, so as to prevent any prejudicial consequences in future. These have been the means of establishing a more regular system of marling husbandry in that county, than perhaps is to be found in any other part of the island. When a field is marled, the tenant is bound to lay it out in grass, with the next or succeeding crop, and allow it to remain three or four years in pasture. When broken up for corn, a certain specific number of crops only are to be taken, before it is again laid out to grass; and so on, during the currency of the lease. The tenants are also debarred from laying on marle a second time on the same field, in the course of one lease, which is commonly for nineteen years, unless it be properly mixed with dung, or other substances. Thus the improper practice of overcropping the land after marling, and the no less injudicious custom of repeated marlings at short intervals, are both prevented; and under these restrictions, which are in general very steadily adhered to, marle is found in that district a most beneficial manure, and the lands continue in a progressive state of improvement. Although it appears doubtful whether marle, unless laid on in large quantities, be advantageously applied to strong clays, yet it seems universally agreed, that for all light, dry, sandy, and gravelly soils, it is the best manure yet discovered. That being the case, every occupier of such lands ought to be extremely attentive in searching for marle; and the proprietors and farmers in those districts where it has been lately discovered, will essentially promote their own interests, by bringing into general use a manure, which has been found in so many other districts a source of real wealth, and a means of substantial and extensive improvement."

It is stated in the survey, that "this substance, in Strathern, in Perthshire, is sold from eight to ten-pence the boll, being eight cubical feet. The ordinary allowance for an acre is from forty to sixty bolls. A gentleman on the Nairn estate, betwixt Perth and Dunkeld, told the writer that the farmers

in that district go even the length of one hundred bolls to the acre: but most of the land in that county is a deep strong loam. The most experienced improvers allow forty bolls for a second marling, after an interval of fourteen years. The interval now adopted in the Stormont is nineteen years, especially on the estate of Balharry and the country adjacent. On all light land its effects are powerful and immediate; but it requires to be managed with caution. Many places of the Stormont, and indeed in all Strathmore, have been almost laid waste by the excessive application of this stimulating manure and over-cropping the ground. At Bradiiton the soil lost all the power of cohesion, and became so light by this cause, that it has no sward; the surface and the soil were blown away with the winds, in the same manner as dust is raised from the roads; and dens were made in some instances to the depth of five or six feet. About Bakie, along the road from Coupar to Meigle, and in many other places, the same injury has been done to the soil, by the injudicious use of marle. He saw one field west of Blairgowrie, which had been so reduced, that after it had lain fourteen years or more in grass, it had scarcely gathered a decent sward. Mr. Smyth of Balharry, to whom he owes much of his information relative to that country, told him that the land of Fullarton had been marled every second year for a succession of ten or twelve years, which at length put the ground from carrying oats, but not from barley; which management and effect still continued in 1795. This fact seems to indicate that oats will exhaust marled land more than barley; or that the dung given to the barley crop, corrects the exhausting quality of the marle.

"But the marle discovered in Strathern has been applied very successfully to the lands in that neighbourhood, for a long time, because a succession of scourging crops is not allowed. No such consequences have followed as these in the Stormont. The expence of dragging it out of the loch amounts to three-pence the boll, and a stratum of moss, from nine to sixteen feet, must be removed, before the bed of marle in one end of the lake can be wrought. Sir William Murray showed him a field of thin gravelly moor laid down with marle alone, every acre of which, by such a dressing, was equal to the maintenance of four sheep. In some parts of the same moor which had not been ploughed at all, the heath was banished in three years by a top-dressing of marle, and succeeded by a fine close grass."

However, in the trials of Mr. Chatterton, made on a farm that had been marled at some very distant unknown period before, and had, in consequence, been altered in its soil from a weak sandy gravel to a rich loamy gravel, to the depth of ten or twelve inches, or such a depth as had been moved by the plough; on discovering a pond from which marle had been taken, the year after his entering upon the farm he began with the marle. The first piece to which he applied it was that of some old mowing ground, which was situated high, and was near a sharp gravel; it had but a very dry poor sward, producing only a small proportion of ordinary hay. He covered five or six acres with marle, laying about forty loads upon the acre, and after it was spread, was extremely attentive to seize a proper opportunity to harrow it small or fine, as it is seldom in a fit state for that work except upon a change of weather. The first year, the improvement did not make much appearance, but in the year following it was astonishingly great, both in the quantity and quality of the hay, and continued so as long as he remained upon the farm, which was about six years, being greatly increased in value. In the following year he applied the same quantity *per* acre, to a few acres in the middle of a field

MARLING OF LAND.

field that was under the plough, which was spread and ploughed in; after which oats were sown, and the crop upon the marled part was superior in strength and richness to the other part of the field: but it did not seem to have undergone so great a change as the portion of grass land just noticed. It is probable that the reason might be, that the piece sown with oats had never been marled before; while the other, from the strength and firmness of the soil, seemed to have had marle laid upon it at some time, as the top soil was much more free from pebbles, though underneath there was a very strong gravel. When the field was in the state of grass-seeds, after the oats, the colour of the grass was observed to be the strongest and richest in the place where the marle had been applied; but as the whole was pastured together, the difference in the quantity of produce could not be ascertained. It is added that several other fields were marled while in the state of tillage, with about the same number of loads *per* acre, all of which answered very well under the plough, were seeded well with grass, and became rich pastures; but that where the land was the most gravelly and sharp, the greatest change was produced. Vide Communications to the Board of Agriculture, vol. iv.

And in the practice of Mr. Kiddle, as stated in the same work, a vast superiority was found in the use of clay marle, in the proportion of sixty loads to the acre, over that of the chalky kind, on land of the new broken-up heathy kind, both in the turnips and crops which succeeded them, being nearly better by one half; which strongly shews the necessity of procuring, if possible, clay or marle of the clayey kind, for such sorts of soil, even if brought from some distance, as the land is by such means doubled in value; but that if it cannot be procured, and that of the chalky description presents itself, it must at all events be employed, "as without a staple manure such land will never admit of being converted into tillage with any advantage to the cultivator; without clay or marle, land of such quality acquires no firmness, and no turnips can be grown upon them, as in the early part of autumn they will be subject to the "angerberry," and after being infected with it, they never make any progress in their growth, or are of any use for the cattle, particularly those that are in a forward state."

Mr. Marshall, in his Rural Economy of Norfolk, states, that "marle has been so long in use in that district, that there are few farms without marle-pits upon, or near them; so that searching for marle is at present seldom requisite, and the art of discovering it not much studied. The herb colts-foot (*tussilago farfara*) abounding on the soil, is considered as an indication of a jam of marle being situated near the surface. But, whether this is, or is not, an infallible guide, time and accidents or intentional researches have not failed to discover beds of marle in almost every estate, and, in some places, on almost every farm, situated sufficiently near the surface to be worked with advantage. Of the quality of marles, the farmers in this district are, in a great measure, uninformed. That which falls most readily, and 'gets to work' the soonest, is in the best esteem; but, in general, the quantity of 'uncallow' (namely, the coping, or covering of earth, which lies upon the head, or jam) is more attended to than the intrinsic value of the marle. The depth of uncallow is generally very unequal; perhaps on the same jam of marle it will vary from one or two to six or eight feet deep, the surface of the jam usually rising into inequalities, termed heads." And "the depth of the jam is equally uncertain; he has seen one worked twenty feet deep; but in general, he believes, ten or twelve feet may be reckoned a middling depth. The bottom of the jam being generally a white absorbent sand, no pump or artificial drain

is requisite to free a Norfolk marle-pit from water, which no sooner touches the sand than it vanishes, as through the grate of an open drain."

It is suggested that in this county, "in working a marle-pit, the top soil is thrown back for manure; the remainder of the uncallow thrown to the bottom of the pit, and levelled for the carts to stand upon. When the jam is low, the marle is thrown immediately from it into the carts; but if it be too high for this operation, piles are driven in a row a few feet from the face of the jam; and, as soon as a crack is formed, water is poured into it, more especially when the marle is dry and stubborn; and by this means many loads are thrown down at once; either to the bottom of the pit, or on to a platform level with the body of the cart; into which the marle, in this case, is thrown with great ease. Taking up the bottom of the jam is the most difficult part of the operation; the marle being first to be cast up on to the bottom of the pit, and afterwards to be thrown into the carts. But by thus bringing up the bottom, two valuable things are obtained; a drain for the water, and a most convenient receptacle for the next line of uncallow. The labour bestowed on marle previous to its being put into the cart, whether it be incurred by throwing down, loosening by pecks, crows, &c. or fetching up the bottom, is termed 'casting'—the act of throwing it into the cart being called 'filling.'—The price of casting was then three-pence to sixpence a load, according to the circumstances of the pit (the uncallowing being generally done by the day); and the price for filling two-pence or two-pence halfpenny, according to the size of the loads carried. He has known three-pence a load given for filling and spreading large loads: the price of spreading, alone, is about one shilling an acre. The number of loads carried out in a day by one team, varies, of course, with the distance to be carried; when the pit happens to lie in or contiguous to the ground to be marled, thirty loads have been carried; but five and twenty is, he believes, considered as a good day's work." But these prices are nearly doubled at the present period.

The quantity set upon an acre here is "equally various; depending upon two things: upon the judgment of the person who marles, and upon whether the land has, or has not, been marled heretofore. It is known, from common experience, that land which has been recently marled, receives no apparent benefit from a second dressing of the same manure; but it is equally well known that, after some length of time has elapsed, a repetition of marling will generally answer. It is a notion pretty generally adopted, that, in this case, the quantity ought to be greater than it was the first or preceding time: and it being formerly the practice to set on a great quantity at once, seldom, perhaps, less than forty loads an acre, this notion has, probably, deterred many persons from doing that which would have been serviceable to themselves and their country. But there is not, it is believed, any general rule known, respecting either time or quantity: he has had frequent opportunities of making observations on a farm which affords a striking instance on this subject. Two or three different tenants had failed successively on this farm; though by no means high rented. The greatest part of it had within the memory of man been marled with not less, in all human probability, than forty loads an acre; and the tenants who failed despaired of reaping any benefit from a second marling after so short an interval of time; but this farm falling into the hands of a more judicious tenant, he has, by marling, (and by other good management) accumulated, in little more than twenty years, a farmer's fortune; during which time he marled upwards of one hundred acres; and has found, from long experience, that twenty-five loads an acre,

acre, notwithstanding the recent marling, a sufficient quantity. He does not mean to intimate that the same management would every where produce the same effect; but he will venture to say, that no man having marle upon his premises ought to neglect to try its effect, by accurate and repeated experiments, upon every piece of land in his possession, without being led away by any received notion, or general rule. The quantity set on, upon land which is not known to have been marled, or out of which the marle is worn, is, at present, less than formerly." But in the southern hundreds, to which marle is obliged to be fetched a great distance, ten or twelve loads are considered as a dressing; six or eight are frequently set on; while in the more central and northern parts of the district, where marle is common on almost every farm, twenty or thirty loads an acre are generally allowed, and sometimes forty loads. "And when it is known, from experience, or taken for granted without proof, that land, either through a recent marling, or other cause, is not improveable by marle alone, a small quantity is mixed up with dung; either by bottoming the farm-yard, or the muck-heaps, with it; or by mixing it layer for layer with the dung in the heaps. In either case, they are afterward turned up, and thereby mixed more intimately together. With this preparation, marle has been found to answer, where, in its natural state, it had no effect."

It is stated, in regard to the necessity of marling, that "the symptom, or indication, of a piece of land requiring to be marled, is taken from the plants which prevail upon it. 'Buddle' (*chrysanthemum fegetum*, corn-marigold) is considered as a certain intimation that the land it abounds upon requires to be marled. 'Smart-weed' (*polygonum pennsylvanicum*, pale flowered perficari) is likewise an observable symptom. It is, it is believed, an undoubted fact, that marle, in a manner, extirpates these plants from the soil; and that 'quicks' (*triticum repens*) are considerably checked by it."

It may be noticed that in this work three-wheeled carts are of vast utility, from their great ease and convenience to the cattle or teams, that are made use of in performing it. See MANURE.

MARLINS, in *Artillery*, tarred white skins, or long wreaths or lines of untwisted hemp, dipped in pitch or tar, with which cables and other ropes are wrapped round to prevent their fretting and rubbing in the blocks or pulleys through which they pass. The same serve in artillery upon ropes used for rigging gins, usually put up in small parcels, called skins. See MARLINE.

MARLITE, BITUMINOUS. See MARLE-Slate, *Bituminous*.

MARLO, in *Geography*, a town of Mecklenburg, on the Trebel; four miles E. of Rostock. N. lat. 54° 12'. E. long. 12° 42'.

MARLOE, CHRISTOPHER, in *Biography*, an early English poet, was born in the reign of Edward VI. and educated at Cambridge. He appeared upon the stage in the reigns of Elizabeth and James I., and was, like his contemporary Shakspeare, both an actor and a writer of plays. He composed seven tragedies, which were highly applauded, and which, according to Mr. Warton, manifest traces of a just conception, but they abound in tedious and uninteresting scenes, or with such extravagances as proceeded from a want of judgment and the barbarous ideas of the times. He translated many classical pieces, among which were some of "Ovid's Elegies;" and the first book of "Lucan's Pharsalia." He is the author of an elegant sonnet entitled the "Passionate Shepherd to his Love," printed in Percy's *Reliques*. Marloe possessed much fancy, and sometimes writes

in a vein of pure poetry, with smooth versification. He is charged with irreligion and infidelity, and was licentious in his manners. His end was tragical; having quarrelled with a footman about a young woman of no reputation, he was stabbed with his own sword, that he had drawn upon his rival. This was about the year 1593. Moreri.

MARLOW, GREAT, in *Geography*, a borough, market-town, and parish in the hundred of Debsborough, Buckinghamshire, England, is situated near the banks of the river Thames, 17 miles distant from Aylesbury, and 31 from London. The manor, called in Domesday book Merlaw, belonged, previous to the Norman conquest, to the earls of Mercia, but, being seized by king William, was given by him to his queen Matilda. Henry I. who inherited it from his mother, bestowed it on his natural son Robert de Melhent, afterwards earl of Gloucester, from whom it passed with that title to the Clares and Despencers, and from the latter, by female heirs, to the Beauchamps and Nevilles, earls of Warwick. It continued in the crown from the time of Richard III's marriage with Anne Neville, till queen Mary granted it to William lord Paget, in whose family it remained more than a century. From the Pagets it passed through several intermediate possessors to sir William Clayton, who purchased it in the year 1736. It is now the property of his descendant sir William Clayton, bart. who has a handsome seat, called Harleyford, at a short distance from Marlow.

The town of Great Marlow has been supposed, from the denomination Chipping Marlow, which occurs in ancient records, to have been a market-town in the time of the Saxons. It now consists of two principal streets, and three smaller. The High street is spacious, on a gradual descent, and contains many good houses. The whole town has been recently much improved. Its prosperity has been increased by the department of the Royal Military college, which has been provisionally established here. The college consists of two departments respectively appropriated to the senior and junior classes of pupils. The first class is settled at Wycomb, and is for the instruction of officers in the duties of the general staff; the second, at Marlow, for those who, from early life, are intended for the military profession, and who, by these means, may be grounded in the science previous to their attaining the age that enables them to hold commissions. The whole college will shortly be removed to Blackwater, where extensive and appropriate buildings are now erecting from designs of John Sanders, esq. architect.

The church of Marlow, which is a spacious and ancient structure, consists of a body and two aisles, with a transept dividing it from the chancel. From the tower rises a wooden spire, erected in the year 1627. The nave is separated from the chancel by a screen of chalk decorated with tracery. The altar is of oak, curiously carved. The old bridge, which crossed the Thames at Marlow, is of very remote origin; among the patent rolls in the Tower are grants from Edward III. and two succeeding monarchs, allowing the bailiffs to take toll of all goods and merchandize passing over or under the bridge; the receipts to be expended in repairs. This structure becoming ruinous and unsafe, the present bridge was erected by private subscription in the year 1789. The principal charitable institutions in the town are two free-schools, one for twenty-four boys, and the other for the same number of girls, founded by sir William Borlase about the year 1624; and alms-houses for poor widows, endowed pursuant to a deed of trust from John Briokhurst, esq. dated July 20th, 1608. The rents of the estates appropriated to their support now amount to forty-two pounds yearly; which have enabled the trustees to add two persons to the establishment,

blishment, which originally consisted of only four. Some faint traces of a corporation are discovered in the records concerning the town, but it does not appear that any charter for its government was ever obtained; the last mention of the mayor and burgeses occurs about the end of the fourteenth century. The first return for the borough was in the twenty-eighth year of Edward I. when Richard le Mouner and Richard le Veel were chosen as its representatives in the parliament held at Lincoln. It continued to send members till the second of Edward II. after which no returns were made for 314 years, till the twenty-first of James I., when, on a petition to the house of commons, the privilege was restored. The right of election is in the inhabitants paying scot and lot; the number of voters being about 200. A market is held on Saturdays, and two fairs annually. The population survey in 1801 stated the parish to contain 643 houses, occupied by 3236 persons. At a short distance from the town are the Temple mills, where extensive works are carried on in copper and brads.

About two miles eastward is the village of Little Marlow, which contains 128 houses, and 728 inhabitants. A benedictine nunnery was founded here about the time of Henry II.; but scarcely any part of the conventual buildings is now standing, the principal materials having been used in the construction of a farm-house.

On the south side of the Thames, nearly opposite to Great Marlow, is Bisham abbey, which appears to have been erected by William Montacute, earl of Salisbury, in the year 1338, for canons of the order of St. Augustine. It is now the seat of N. Vanfittart, esq. M. P. Lysons's *Magna Britannia*, vol. i. 410. Beauties of England, vol. i.

MARLOW, a town of America, in Cheshire county, North Hampshire, containing 543 inhabitants.

MARLSHAND, an island of Sweden, near the W. coast, in the North sea. N. lat. $57^{\circ} 53'$. E. long. $11^{\circ} 29'$.

MARLY, *Machine of*, in *Hydraulics*, is a very complex machine for raising water at Marly, about ten miles N.W. of Paris, the primum mobile whereof is an arm of the river Seine, which, by its stream, furnishing a fall of water of three feet, turns fourteen large wheels, which work the handles, and these with pistons raise the water into the pumps, and with other pistons force it up in pipes against the ascent of a hill to a reservoir in a stone tower. The basin of the tower, which receives the water raised from the river, is 610 fathoms distant from the river, and 500 feet higher than the lower end of the sucking pipes of the lower engines of the machine. The basin supplies an aqueduct of thirty-six arches; whence the water is separated into different conduits which lead it to Marly, and formerly led it to Versailles and Trianon. The number of pipes in this machine is 253; and the quantity of water raised by it amounts to 3258 tons in twenty-four hours, or near 220 tons *per* hour, or $3\frac{1}{2}$ tons *per* minute; but the London-bridge water-works, with four wheels only, raise 11,724 tons in twenty-four hours, which is almost twice and a quarter as much. Some of the largest of our fire or steam-engines used in England, will raise as much water as that of Marly to the same height, and not cost above 10,000*l*.

This machine, which began to work in 1682, and is said to have cost above four millions of pounds sterling, was made by one Rannequin, a common mechanic of Liege, and has a great many excellent contrivances; but yet does not raise all the water that it might have done, because the maker did not know how to give the river Seine all the advantages of which it was capable. Hence appears the necessity of a mechanic's being well acquainted with mathematics; or that able mathematicians should apply themselves

to mechanics more than they do, and not think it below them to direct workmen. See Defagul. *Exper. Philos.* vol. ii. p. 442 to 449.

According to Dan. Bernouilli's computation, the effect of the machine of Marly is not more than $\frac{1}{8}$ of its absolute force; that is, there is a loss of $\frac{7}{8}$ of that force. Dan. Bernouil. *Hydrodyn.* p. 182.

MARLY-LA-MACHINE, in *Geography*, a town of France, in the department of the Seine and Oise, and chief place of a canton, in the district of Versailles, situated near the Seine, and celebrated for its water-works; four miles N. of Versailles. The place contains 1227, and the canton 12,397 inhabitants, on a territory of 90 kilometres in 17 communes.

MARMAGNE, a town of France, in the department of the Cher; four miles W. of Bourges.

MARMALADE, a confection made of the juice or pulp of some fruit, as plums, apricots, quinces, boiled with sugar to a consistence.

The marmalade of quinces is the most frequent: it is sub-astringent, and grateful to the stomach.

MARMANDA, in *Geography*, a town of France, and principal place of a district, in the department of the Lot and Garonne; situated on the Garonne. The place contains 5598, and the canton 14,385 inhabitants, on a territory of $172\frac{1}{2}$ kilometres, in 15 communes. The trade of the town, which is considerable, consists in corn, wine, and brandy. N. lat. $44^{\circ} 30'$. E. long. $0^{\circ} 15'$.

MARMARICA, in *Ancient Geography*, an extensive country of Africa, bounded on the E. and W. by Egypt and Cyrenaica; on the S. by the Sahara, or deserts of Libya interior, and on the N. by the Mediterranean. After passing the Glaucum Promontorium, Cape Deris, the port Leucaspis, and other inconsiderable promontories and harbours, we come to Parætonium, called by Strabo Ammonia, a city of considerable note. Florus styles this city and Pelusium the two horns of Egypt; whence it appears that he considered Marmarica as part of Egypt, and Parætonium as a fortress of great strength. At some distance from Parætonium, towards the frontiers of Cyrenaica, stood Apis, a town so denominated from the Egyptian deity of that name. Triferchis, Zagylis, and other places on the sea-coasts, enumerated by Ptolemy, are so inconsiderable as not to merit attention. The principal Libyan nations inhabiting this region were the Adymachidæ and Ammonii. Some authors seem to make the Marmaridæ a nation inhabiting a particular territory contiguous to the greater Catabathmus; but others incline to the opinion, that all the Libyans of Marmarica were comprehended under this appellation. Father Calmet thinks that Marmarica was first peopled by the descendants of Lehabim, the son of Mizraim, mentioned by Moses. Herodotus assures us that there was a great affinity betwixt them and the Egyptians, in the most important points.

MARMARIUM, a town of Greece, in the island of Eubœa.

MARMARO-PROSERA, in *Natural History*, is a species of stones forming continued strata, bright and beautiful, of very lively colours, and of a constitution so fine, that they will take a good polish; in all which particulars they agree with the genus of marbles, but differ from them in that they are never calcareous, nor do they ferment with acids. To the same class belong the granites and the porphyries.

The marmaro-prospera are stones of a compact, uniform texture, like that of marbles; some of them are vitrifiable, others not and some are of such hardness as to strike fire

with steel. Of this kind is the basalt. Da Costa's Hist. Foss. p. 252, &c.

MARMARUOLO, in *Geography*, a town of Italy, in the department of the Mincio; eight miles N. of Mantua.

MARMARYGÆ, a word used by the old writers in medicine, to express sparks of fire, or the appearance of such flashing before the eyes in some disorders.

MARMIGNAC, in *Geography*, a town of France, in the department of the Lot; nine miles S.W. of Gourdon.

MARMOL CARAVAJAL, LUIS DE, in *Biography*, born in the sixteenth century, at Granada, was taken prisoner by the Moors of Barbary, and carried to Morocco. Here he collected all the materials he could get for an account of the country, which, when he escaped from the house of bondage, he published under the title of "La Description General de Africa." The French translation of this work by M. D'Ablancourt is very highly esteemed. Gen. Biog.

MARMONTEL, JOHN-FRANCIS, a distinguished French writer, was born in 1723. His father was in low circumstances, and obliged to exercise great frugality in bringing up his children. His early education presented him with few literary advantages, but from his mother, whose language and sentiments were much superior to her station, he derived much benefit with respect to mental cultivation, by which he soon distinguished himself among his contemporaries. Through her influence he was sent to the Jesuits' college of Mauriac, where, with the practice of strict economy, he was enabled to go through the studies of the place. At the age of fifteen his father placed him with a merchant at Clermont; but he had a mind ill adapted to trade, and took the first opportunity of quitting it after his arrival, and hiring a garret, with a few livres that he took with him, wrote to his father that he felt a vocation for the ecclesiastical profession. He was allowed to follow the bent of his inclination, and was admitted at once into the philosophical class in the college of Clermont. His wants were few, and these he readily supplied by undertaking the office of instructing others in their earlier studies. The death of an affectionate father, in the second year of this occupation, was a very severe stroke upon him, but his heart was adapted to the exigency, and he instantly took upon himself the paternal charge with respect to an almost destitute family. He engaged as teacher of philosophy in a seminary of the Bernardines, and his talents almost immediately gave him a marked distinction in the society of monks, and prospects of greater celebrity soon opened upon him. He wrote an ode as one of the competitors for the prize given by the academy of "Floral Games" at Toulouse. The award was given against him, but being dissatisfied with the decision he sent his performance to Voltaire, who returned it with many commendations, and at the same time presented him with a copy of his works. He regarded this testimony of regard from so great a man as much superior to the prize for which he had been striving, proceeded with ardour in his career of studies, and obtained the prizes of several successive years. His scholars rapidly increased, and in the same proportion his gains were augmented, which he applied to the support of the family chiefly dependant on his labours. He sent for one of his brothers to be educated at his own expence and under his own eye. About this period he formed a resolution to quit his studies that he had been pursuing to fit him for the ecclesiastical profession, and by the advice of Voltaire he determined to try his fortune at Paris as a man of letters: he obtained as an introduction the patronage and protection of M. Orri, the comptroller-general of the finances. Scarcely,

however, had he reached the great city, when he found that his friend had been dismissed from the ministry. He was now encouraged by Voltaire to write for the stage; he made the attempt, but in this and other efforts of a different nature he was completely unsuccessful, nor could with all the application of which he was master save himself from a state of indigence, and he was glad to undertake the education of a youth to improve his circumstances. This gave him admission to a select and agreeable society, and by putting him out of the reach of want his mind was free for any exertion. He accordingly set about a tragedy, which he finished, under the title of "Denis le Tiran:" it was acted in 1748, and obtained very general applause. From this moment money and fame poured in upon him: he attracted general notice, "was feasted and complimented, and at once fell into the vortex of Parisian fashion." He did not, however, neglect the art to which he was indebted for his reputation, and in 1749 he brought forward a second tragedy, entitled "Aristomene." Voltaire sat with him in his box, and cordially joined in the applause which it received. His next piece was the tragedy of "Cleopatra," which was finished and acted in 1750: this was probably written in a hurry, and its success was very indifferent; and the "Heraclides" which soon followed absolutely failed. This disappointment seemed to rouse him into action, and made him attentive to future fortune. He obtained the place of secretary of the royal buildings by the influence of Madame Pompadour, and under her brother M. de Marigny. He immediately took apartments at Versailles, and "here," says he, "thank heaven terminate the errors and deviations of my youth." In his literary capacity he was connected with d'Alembert and Diderot, and was their coadjutor in the *Encyclopédie*. His services to persons in power procured him a pension upon the privileged work called the *Mercurie François*. In this he published his "Alcibiades," composed at a single sitting, and which was received with so much applause that he followed it with "Soliman II." the "Scruple," and others; this was the origin of the "Contes Moraux," which became so popular throughout Europe. In 1758, he quitted his office at Versailles, and went to Paris, where he became an associate with all the men of letters and artists in that capital. His happiness was, however, soon interrupted, by refusing to give up the author of some severe verses which he had imprudently repeated in company. They were accordingly attributed to him, and he was committed to the Bastille. His confinement was short, and his treatment in it was of the mildest kind. After his liberation, he made a tour through the southern provinces of France, in which he paid a visit to Voltaire, and then wrote his "Épître aux Poètes," for the prize offered by the French Academy, and obtained the object of his ambition. In 1763 he was admitted a member of that body. His next literary production, and that which has conferred the greatest celebrity on his name, was his "Belisaire." The liberal sentiments which he had put into his hero's mouth concerning religious toleration, and the unimportance of controverted theological tenets, excited the resentment of the Sorbonne, which proceeded to a censure of the whole work, but it could not stop its career: very large impressions were dispersed over France and all Europe. On the death of Duclos, in 1772, Marmontel was appointed, without any solicitation on his part, to succeed him as historiographer of France. He prepared himself to exercise the duties of his new office by collecting materials for the reign of Louis XV.; he also engaged in the composition of the Supplement to the *Encyclopédie*. After he had attained to the age of fifty-four he married a young lady of eighteen,

eighteen, and it is said that this union, so very unsuitable in point of years, was the source of much real felicity. About the same period he published another work, entitled "Les Incas, or the Destruction of the Empire of Peru," which united history and fiction, and which was evidently, like the *Belisaire*, for the purpose of inculcating liberal principles and enlightened sentiments. In 1783 he was, on the death of d'Alembert, elected to the post of perpetual secretary of the French Academy, and from this period his compositions were chiefly confined to eulogies and other pieces read before the academy, as well in verse as in prose. He also employed himself in a complete edition of his works, now become very voluminous. During the latter years of his life he had to witness the stormy scenes of the French revolution: his ideas of reformation went no farther than the concessions offered by the crown in 1788, and he contemplated with horror those constitutional changes which he saw meditated by the popular party. He was, nevertheless, chosen a member of the electoral assembly: but soon lost the confidence of his constituents, by opposing an unlimited liberty of the press, and he gladly retired to his country-house to remain a spectator rather than actor in the great revolutionary drama. In his retreat from the busy and noisy world, he employed himself in writing some additional "Contes Moraux;" and a "Cours Elementaire" for the instruction of young persons, consisting of short treatises on grammar, logic, metaphysics, and morals. He also drew up memoirs of his own life, addressed to his children. In 1797 he was brought forward again into public life, and chosen a representative of the department of Eure, and was, in the national assembly, particularly charged with the defence of the Catholic religion. He pronounced before the legislative body a discourse "On the free exercise of public worship," and he continued to discharge the functions of his office, till the decision which rendered null the elections of his department, with those of many others. He died, almost in indigence, in December, 1799, in the seventy-seventh year of his age; leaving a widow and two young children without support. As an author, Marmontel is characterized as warm and eloquent on grave and elevated topics, easy and lively on light ones, ingenious, inventive, and varied, full of good sense and animated with sentiment: he is almost equally successful in his addresses to the heart, the imagination, and the judgment. His "Contes Moraux" contain many fine stories, delightfully told, and scarcely has any work of the age been more popular: the morality of some of them is very doubtful, and hence the title "Moral Tales," as translated in our language, is not in all cases proper. They are fictitious narratives relative to life and manners, and in general they inculcate valuable and useful lessons. Since his death his own memoirs have appeared, and also "Memoirs of the Regency of the Duke of Orleans," printed from his manuscript, in 2 vols. 12mo.

Marmontel, after hearing the "Serva Padrona" of Pergolesi performed in 1751 at Paris, in Italian, and by Italians, was one of the first converts to the music of Italy in France.

This natural, easy, graceful, and pleasing intermezzo, which produced Rousseau's famous "Lettre sur la Musique Françoise," likewise opened the ears of Diderot and d'Alembert, the abbés Anauld and Morillet, Messrs. Suard and Grimm, who ever after continued hostile to the old style of French music.

Gretry, returning from Italy in 1767, new set, at Geneva, Favart's comic opera of "Isabelle et Gertrude," which succeeded so well, that, on the young composer's arrival at Paris, Marmontel furnished him with other musical

dramas; and they seem to have been constantly attached to each other ever after.

When Piccini arrived at Paris in 1778, Marmontel instantly became a Piccinist, and wrote a pamphlet "On the Revolutions of Music in France," which gave great offence to the Gluckists.

We have often observed, that the French talk and write on the subject of music better than the Italians; but it is all declamation. There is no part of music, vocal or instrumental, in which they are comparable to the Italians.

Marmontel's ideas about dramatic music are scattered through the *Encyclopédie*, which M. Laborde has collected and drawn to a focus, in his "Essai sur la Musique," published in 1780; and in Marmontel's "Revolutions," we have his *profession de foi musicale*, drawn up by himself.

But of all the reformers of French music, and partizans of the Italian, Diderot and Marmontel were perhaps the only two that were in earnest, and who seem to speak from feeling, not from system. "Woe to those," says Marmontel, "whose taste and ideas surpass their means of gratification! The partizans of Lulli and Rameau forgot their quarrels, and united in defending French music of every kind against the Italian." Marmontel fought stoutly for melody; for the simple, elegant, and graceful melody of Italy. "Gluck," he says, "not only gives less melody, but melody of a more vulgar and common kind, than Piccini, Sacchini, and Pergolesi."

The Greeks did not allow that any pain or grief should distort and deform the features in any one of the arts. In singing, Hæse tried his most difficult passages in a mirror; and the dying gladiator, the Niobe, and the Laocoon, make no frightful faces. A pathetic and passionate air in music is not to scream or howl. No passion should be expressed in music, that is not softened into pleasure by the sound, by exquisite musical tones and chords. "Melody without expression is of little effect: expression without melody is something, but not all we want. The union of melody and expression of the most perfect kind is the problem to be solved; and the melodies of Piccini, Sacchini, and Paesello, sung by a Pacchierotti or a Marchesi, is the solution. Vinci first revealed the mystery, by his natural, graceful, and flowing melodies, undeformed by complication in the accompaniments. Gluck has certainly not invented a new *genre*. He has, indeed, improved that of Lulli and Rameau by more movement and fire; but he has injured the Italian recitative, by loading it with harmony."

All Marmontel has said is true and reasonable; but he has not said enough. The root of the evil,—the grand, and, we fear, the invincible impediment to the introducing Italian melody on the French stage, is the *singing*. Gluck said to the complainants of want of air, of graceful, passionate, or spirited melody in his operas, that "they had no fingers to perform them." If the French themselves would allow this as an excuse for Gluck, and place his trivial airs to necessity, we should honour their taste and candour, and lament their privation of the delight which fine airs, well sung, afford true lovers and judges of music. But when we are told that these ballad airs are models for the rest of Europe, where good fingers can be found, we think it borders upon arrogance, very unbecoming a nation just emerging from barbarism in vocal music.

The serious dramas, written for music by Quinault, have increased in favour, as poetry, in spite of Boileau's four censures, ever since the death of the author. The airs, however, could not be set to modern melody in their original state. And when Piccini arrived in France, and requested

to be furnished with dramas to set, in which the songs were phrased and polished like those in the operas of Metastasio, the true models of lyric poetry, Marmontel, in order to preserve the admirable lyric tragedies of Quinault, modernized the airs, and retained all the original beauties of the dialogue. Encouraged to this undertaking by the most enlightened men of letters, to whose judgment he submitted his labours, he prepared for Italian music the poems of Amadis, Roland, Perseus, Proserpine, Atys, Phaeton, Isis, Theseus, and Armide; and on being applied to by the directors of the opera to let Piccini have one of them to set, he gave them their choice, which fell upon Roland, of which the fable was taken from the "Orlando Furioso" of Ariosto. Piccini was unacquainted with the French language: it was therefore necessary, in explaining the poem, to accompany him in his labour step by step; and Marmontel performed this task with as much zeal and solicitude as Quinault himself could have done. The Italian composer, from these instructions, became in a short time so well acquainted with the accentuation and musical expression of French words, that the most severe critics were unable to point out a single fault which he had committed against the prosody and genius of the language. "It is well known," says M. Laborde, "how complete was the success of this undertaking: he amply fulfilled the wish of Marmontel, and resolved the problem, whether the French language was capable of receiving Italian music." We still think it is not; as the music which Piccini and Sacchini have set to French words is very inferior to that which they have set to their own language.

The number of operas, serious and comic, which Marmontel produced for the several theatres of France, between the years 1747 and 1778, is prodigious. Very early in his life he furnished Rameau with operas for the Academie Royale de Musique; and besides his dramas that were set by others, he was author of the words of almost all the comic operas which were set by Gretry, during his long and successful career.

MARMOR, MARBLE. See **MARBLE**.

MARMORA, in *Geography*, a river of European Turkey, which runs into the Strimon, 6 miles N.W. of Emboli, in the province of Macedonia.—Also, a town of European Turkey, in Macedonia; 34 miles E.N.E. of Saloniki.—Also, an island in the straits of Constantinople, or sea of Marmora, about 12 leagues in circuit. It is lofty, mountainous, and tolerably fertile: it contains several towns or villages, rather populous; it has two harbours, which are by no means extensive, situated towards the south. Vessels surprised by a northerly wind, somewhat strong, repair hither for shelter. The inhabitants have a few flocks of sheep: they cultivate the vine, the olive-tree, and cotton, and gather various species of grain. Marmora formerly bore the names of Nevris, from νεβρις, the fawn of a doe; Elaphonnesus, from ελαφος, a stag, and νησος, island; and Proconnesus, from προς, προκος, signifying a young stag, and νησος, island. These latter names were given to it from the number of stags which were met with in it. But Olivier thinks that none exist there at this day, as the woods are destroyed, and the mountains are almost naked. This island has received its name Marmora from a white marble, a little veined with grey and blueish, which is furnished by it in great quantities. Although the grain of this marble is not fine, nor its colours beautiful and mixed, the Greeks esteemed it formerly, and made frequent use of it: they distinguished it by the name of "Cyzicus" marble, because that peninsula afforded some, probably, of the same quality,

or because the town of the same name served as an emporium for it. Fragments of it are found among the ruins of almost all the ancient cities: pillars of it are seen in various places, and particularly in the mosques of Constantinople. It is said, that the stately palace of Mausolus, at Halicarnassus, was lined with this marble. At the present day, it is only wrought for the sepulchral stones made use of by the Turks, the Armenians, and the Europeans: it is seldom employed in the construction of houses. N. lat. 40° 30'. E. long. 27° 33'.

MARMORA, *Sea of*, or *White Sea*, a gulf between the straits of Constantinople and the straits of Gallipoli; about 90 miles from east to west, and 33 from north to south. It takes its name from that of the island above mentioned.

MARMORA, a town of Asiatic Turkey, in Natolia; 33 miles E. of Magnisa. N. lat. 38° 43'. E. long. 28°.

MARMORA, *La*, a town of Naples, in Calabria Ultra; 16 miles W. of St. Severin.—Also, a town of France, in the department of the Stura; 19 miles W. of Conc.

MARMORICE, a town of Asiatic Turkey, on the south coast of the province of Natolia. The town is small, but situated in a bay with a narrow entrance, which is represented as one of the finest harbours in the world. N. lat. 36° 52'. E. long. 28° 30'.

MARMOROIDÆ, in *Natural History*, are stones, which in their nature, texture, appearance, and other properties, resemble marbles; and only differ from them, in that the bodies of this genus never form continued strata, but are only found in loose independent masses, lodged in strata of other substances. M. Da Costa subdivides these into marmoroidæ of a plain structure, and those which contain shells, corals, and other extraneous bodies. Hist. Fossils, p. 241, &c.

MARMOSA, in *Zoology*. See **DIDELPHIS Murina**.

MARMOSETS, in *Geography*, a harbour in the island of St. Domingo, lying between cape Rouge and Grand Port Berhagne.

MARMOT, **ARCTOMYS**, in *Zoology*, a genus of Glires in the class of Mammalia: the characters of which are, that the animals of this genus have two cutting teeth in each jaw, five grinders above and four below, on each side, and that they have collar bones. This genus is very properly separated from that of *Mus* by Dr. Gmelin, in imitation of Mr. Pennant. Most, if not all the species, hibernate, or become torpid, during winter: they wander in quest of food, and for other purposes, during the day, feeding on roots and grain: they are capable of climbing, and dig burrows in the earth for their habitation; their heads are generally round and convex, having either very short ears, or none; their bodies are thick, with short hairy tails; the fore-feet have each four toes, and a very short thumb, or fifth inner toe; and the hind-feet have each five toes. The cæcum, or blind gut, is generally very large.

The species are as follows:

A. **MARMOTA**, *Mus Marmota* of Linnæus, *Alpine* or *Mountain Mouse*, *Alpine Marmot* of Pennant, and *Marmotte* of Buffon. It has short round ears; the upper parts of the body are dusky brown, and the lower parts reddish. The body is thick and short; the head large and thick, flattened at the top; the nose thick and blunt, often carried erect when the animal sits; the two bones of the lower jaw are moveable on each other; the cheeks are covered and furrowed with long hairs; the muzzle has seven rows of whiskers; above and below each eye is placed a black wart, on which are hairs; the legs are short; the tail is straight, and covered with long hairs; the tip of the tail is very dark brown,

M A R M O T.

brown, almost black; the body and head measure sixteen inches, and weigh nine pounds; the tail is about six inches long. These animals inhabit the highest summits of the Alps and Pyrenean mountains, in dry places where are no trees; feed on insects, roots, and vegetables; are fond of milk, which they take by lapping with a murmuring noise; and drink very little. The Alpine marmots live in societies of from five to fourteen, bask in the sun, and place a sentinel, which whistles on the approach of danger, when they retire into their holes; and if they cannot escape, defend themselves boldly, and bite with great fury. They form burrows with numerous passages and entrances: at the end of September they resort to their subterraneous chambers, which are well lined with moss and dry grass, and stopping the entrance with earth, they remain here in a torpid state of hibernation till the month of March. If they chance to be dug up, and are brought into a warm atmosphere, they gradually revive. They are able to walk on their hind feet, and sit up on their haunches, carrying food to their mouths with their fore-feet. They are easily caught on plain ground, but with difficulty in their holes, as they dig deeper when in danger of being taken, except during their torpid state in winter. At this time, many of them are caught for the sake of their flesh, which is tender and delicate; partly for their skins; and partly for their fat, which the inhabitants of the Alps esteem to be medicinal: but they are chiefly taken by the Savoyards, with a view of exposing them as shows through various parts of Europe. In a tame state, they are very destructive to all kinds of provisions, clothes, linen, or furniture; and can hardly be prevented, even in warm climates, from falling into a state of torpidity in winter. They procreate in April or May; and the female, after six or seven weeks, produces, two, three, or four young ones.

A. *MONAX*, *Mus griseus* of Pallas, *Glis fuscus*, *Marmota Americana* or *American Marmot*, *Monax* of Edwards and Buffon, and *Maryland Marmot* of Pennant, has short rounded ears, blueish nose and cheeks, body of a deep brown colour, and longish tail, which is very hairy. The eyes are black and prominent; the feet and legs are black, with long sharp claws; the tail is half the length of the body. This animal is about the size of a rabbit, and feeds on vegetables: its flesh is very good, resembling that of a pig. It inhabits the warmer states of North America, and the Bahamas. In America, it forms holes in the clefts of rocks, and under the roots of trees, in which it passes the winter in a torpid state; but it is not certain that they hibernate in the Bahamas, where the climate is very mild.

A. *BOBAC*. See *BOBAC*.

A. *EMPETRA* of Pallas, *Canadian Marmot*, *Quebec Marmot* of Pennant, of a mixed grey colour on the upper parts of the body, the lower parts orange; with short rounded ears, and a hairy tail. This animal inhabits Canada, Hudson's Bay, and the other northern parts of America. It is rather larger than a rabbit, and the tail is about two inches and a half long. The cheeks are grey; the face dusky, and not black; on the back the hair is grey at the roots, black in the middle, and whitish at the tips; the belly and legs are of an orange colour; the tail is short, bushy, and of a dusky colour; the feet are black and naked, with four long, slender, divided toes, and the rudiments of a thumb on each fore-foot, and five similar on each behind, all armed with pretty strong claws.

A. *PRUINOSA*, *Hoary Marmot*, with very coarse, long, hoary fur, whitish cheeks, a black nose, and black legs; having short oval ears. Inhabits the northern parts of America; is about the size of a rabbit; with nose black at

the tip; the tail is black, mixed with rust colour; with four toes on each fore-foot, and five behind, all armed with dusky claws.

A. *SUSLICA*, *Souflik* of Buffon, *Casan Marmot* of Pennant, has the upper parts of the body of a yellowish-brown colour interspersed with numerous small white spots, very short ears, hairy tail about the length of the thighs. Inhabits Casan as far as Austria, dwells in the desert, digging holes in the black soil of the declivities of the mountains; which burrows are seven or eight feet long, winding, with several entries, having at the bottom several apartments, stored with corn, peas, linseed, hempseed, and other grains and seeds, in separate cells, and separate holes in which they live. This animal is about the size of a large rat: the tail is covered with short yellowish-brown hair; the fore-feet have four toes, armed with long claws, and a short thumb, or rudiment of a fifth toe; the hind-feet have five toes each, the two outer ones short, and the other three long.

A. *CITILLUS*, *Zifel* of Buffon, *earless Marmot* of Pennant, is of an uniform dark cinereous grey colour, has no external ears, a blunt nose, a long slender body, and a very short tail; inhabits Hungary, Austria, and Poland; burrows like the former, and is rather larger, being nearly a foot in length.

A. *ZEMNI*, *Zemni* of Buffon, *Podolian Marmot* of Pennant, *Zits-jan* of Le Brun, and *little Earth-dog* of Rzaczinski, is of a mouse-grey colour, has short rounded ears, five toes on all the feet, and very minute eyes concealed beneath the fur. Inhabits Russia and Poland; is larger, stronger, and more mischievous than the former. Its body is slender, covered with short, soft fur; the tail of a moderate size; the fore-teeth very large, projecting much from the mouth, the under ones being much longer than the upper; the feet are all divided into five toes, armed with crooked claws; about the size of a squirrel, and in disposition and manners resembling the *Zifel*. It bites cruelly, and feeds voraciously on grains, fruits, and pot-herbs, laying up magazines of provisions in its burrows, where it passes the winter. Gmelin includes the three last described animals under one description, supposing them to be of the same species; but they are separated by Buffon and Pennant. This species is represented as inhabiting the southern parts of Russia, as far as Kamtschatka, and the islands between Asia and America, in Persia and China, but rarely found in the rest of Europe. The male is easily tamed, but the female is fiercer; goes with young between three or four weeks, and brings forth from three to eight young ones about the beginning of May. The fur is very good in the spring, and the flesh is reckoned tolerable. These animals are preyed on by polecats, weasels, hawks, carrion-crows, and cranes. They vary considerably both in size and colour. Gmelin suggests that this animal may be the same with the "*Mus Ponticus*" of Aristotle and Pliny.

A. *GUNDI*, *Gundi* of Pennant, is of a brick-dust red colour, with wide open ears, which appear as if cropt, or cut off. Inhabits Barbary, near Massufa, towards mount Atlas. Its size is about that of a small rabbit; the tail is short; the upper fore-teeth are large and truncated, the lower ones slender and pointed; it has four toes, armed with claws, on all the feet, and uses the sole in walking as far as the heel.

A. *HUDSONIA*, *Hudson's Marmot*, *tailless Marmot* of Pennant, is of a brown-ash colour, with short external ears and no tail. Inhabits Hudson's Bay. It has two cutting teeth above, and four in the lower jaw; the hairs are tipped with white.

A. *MAULINA*, *Chilse Marmot*, is of a reddish-brown colour, with sharp ears, having five toes on all the feet. Inhabits

Inhabits the woods of the province of Maulé, in Chili. This animal agrees with the common marmot in the colour and length of the hair, but is nearly twice as large; the snout is long-shaped, having four rows of whiskers; the feet have all five claws; and the tail is furnished rather thinly with hair.

MARMOT, *German*. See *MUS Cricetus*.

MARMOT, *Lapland*. See *MUS Lemmus*.

MARMOTA. See MARMOT, *supra*.

MARMOTTE VOLANT. See *VESPERTILIO Nigruta*.

MARMOTTE. See *HYRAX Capensis*.

MARMOUTIER, in *Geography*, a town of France, in the department of the Lower Rhine, and chief place of a canton, in the district of Saverne; three miles S. of Saverne. The place contains 1999, and the canton 10,395 inhabitants, on a territory of 105 kilometres, in 25 communes.

MARNAY LE BOURG, a town of France, in the department of the Upper Saône; 11 miles W. of Besançon.

MARNE, a river of France, which rises in the department of the Upper Marne, about three miles to the E. of Langres, and after pursuing a course by several towns, joins the Seine at Charenton.

MARNE, a town of Persia, in the province of Khorasan; 210 miles N. of Herat.

MARNE, one of the ten departments of the N.E. region of France, composed of Remois and Perthois, with a part of Brie, bounded on the N. by the departments of the Aisne and Ardennes, on the E. by the department of the Meuse, on the S. by that of the Aube, on the S.W. by that of the Upper Marne, and on the W. by the departments of the Seine and Marne; about 33 French leagues in length and 30 in breadth; in N. lat. 49°. Its territorial extent is 8480 kilometres, or 405 square leagues, and it contains 310,493, or, according to Hassenfratz, 348,885 inhabitants. It is divided into five circles, 32 cantons, and 499 communes. The circles are Reims, including 105,472 inhabitants; St. Menchould, 30,840; Vitry-sur-Marne, 49,706; Chalons-sur-Marne, 37,062; and Epernay, 87,413. Its capital is Chalons-sur-Marne. Its contributions amount to 4,115,188 fr. and its expences for administration, justice, and public instruction, amounted in the 11th year of the French era to 320,103 fr. 33 cents. The soil of this department is indifferently fertile in grain, and yields good wine and pastures. There are some forests near the extremities of the department.

MARNE, *Upper*, one of the ten departments of the N.E. region of France, formerly Vallage and Bassigny, bounded on the N.W. by the department of the Marne, on the N.E. by the departments of the Meuse and the Vosges, on the S.W. by the department of the Upper Saône, on the S. and S.W. by the Côte d'Or, and on the W. by that of the Aube; 29 French leagues in length and 19 in breadth; containing in territorial extent 6540 kilometres, or 315 square leagues, and 225,350, or, according to Hassenfratz, 223,010 inhabitants. It is divided into three circles, 28 cantons, and 552 communes. The circles are Wassy, including 60,392 inhabitants, Chaumont, 75,134, and Langres, 89,824. Its capital is Chaumont. Its contributions in the 11th year of the French era, amounted to 2,315,762 fr., and its expences to 209,023 fr. 33 cents. In this department are many pleasant vallies, which yield grain, wine, and good pastures. The wooded hills contain iron mines and mineral springs.

MARO, or MARRO, a town of the principality of Oneglia; 9 miles N.W. of Oneglia.—Also, a town of Pegu, situated on an island formed by the mouths of the Ava; 120 miles S.S.W. of Pegu.—Also, a mountain of Portugal, in the province of Alentejo; 6 miles N.W. of Evora.

MAROBUDUM, in *Ancient Geography*, a town of Germany, which belonged to the Marcomani. Ptolemy.

MAROELAT, in *Geography*, a town on the N. coast of the island of Bouru. S. lat. 3° 10'. E. long. 127° 7'.

MAROGGIO, a town of Naples, in the province of Otranto; 17 miles S.E. of Tarento.

MAROGLIO, a river of Sicily, which runs into the sea, near Terra Nuovo, in the valley of Noto.

MAROGNA, a town of European Turkey, in Romania, near the Archipelago; 64 miles E. of Emboli.

MAROLLES, MICHAEL, in *Biography*, son of Claude de Marolles, famous as a champion of the league, in defence of which he killed Marivaut, the royalist champion, in single combat. The son had an extraordinary passion for study, and at the age of nineteen published a translation of Lucan. He was too eager in the pursuit of fame as an author, to attend much to elevation in the church. He applied himself chiefly to translation, and gave versions of Plautus, Terence, Lucretius, Catullus, Tibullus, Virgil, Horace, Juvenal, Persius, Martial, Statius, and the Augustan historians, Ammianus, Athenæus, &c. He began a translation of the bible; and he composed his own "Memoirs," which contain a vast number of anecdotes. An edition of them was published by the abbé Goujet, in three vols. 12mo: His last work was a "History of the Counts of Anjou," published in 4to. in 1681, the year in which he died at the age of eighty-one. Marolles was one of the first who collected prints: his collection amounted to 10,000, and his catalogues of them are much valued by the curious in that walk. Moreri.

MAROLLES, in *Geography*, a town of France, in the department of the Aube; 6 miles N. of Bar.—Also, a town of France, in the department of the North; 6 miles W. of Avesnes.—Also, a town of France, in the department of the Loir and Cher; 6 miles N. of Blois.

MAROLLES-les-Braux, a town of France, in the department of the Sarthe, and chief place of a canton, in the district of Mamers; 7 miles S. of Mamers. The place contains 1808, and the canton 13,993 inhabitants, on a territory of 160 kilometres, in 18 communes.

MAROMMES, a town of France, in the department of the Lower Seine, and chief place of a canton, in the district of Rouen. The place contains 1455, and the canton 14,760 inhabitants, on a territory of 142½ kilometres, in 19 communes.

MARONEA, MAROGNA, in *Ancient Geography*, a town of Ciconia, in Thrace, near the lake Ismaris; it is mentioned as the place of the retreat of the 10,000. Mela places this town on the bank of the Nestus; but Steph. Byz. erroneously near the Chersonesus. M. d'Anville properly fixes its situation on the coast N.W. of Stryma. According to Pliny it had formerly been denominated Ortageurea. As its territory produced excellent wine, it was regarded as being under the protection of Bacchus; and according to traditionary report, this wine had the perfume of nectar.

MARONI, in *Geography*, a river of Guiana, which runs into the Atlantic, N. lat. 5° 52'. W. long. 55° 14'.

MARONIA, in *Ancient Geography*, a town of Syria, placed by Ptolemy in Chalcidia, between Tolmideffa and Coara.

MARONITES, in *Ecclesiastical History*, a sect of eastern Christians, who follow the Syrian rite, and are subject to the pope; their principal habitation being on mount Libanus, or between the Ansarians to the north and the Druzes to the south.

Motheim informs us, that the doctrine of the Monothelites, condemned and exploded by the council of Constantinople,

MARONITES.

nople, found a place of refuge among the *Mardaites*, signifying in Syriac rebels, a people who took possession of Lebanon, A. D. 676, which became the asylum of vagabonds, slaves, and all sorts of rabble (see MELKITES); and about the conclusion of the seventh century they were called Maronites, after *Maro*, their first bishop; a name which they still retain. None, he says, of the ancient writers, give any certain account of the first person who instructed these mountaineers in the doctrine of the Monothelites: it is probable, however, from several circumstances, that it was John Maro, whose name they had adopted; and that this ecclesiastic received the name of Maro, from his having lived in the character of a monk, in the famous convent of St. Maro, upon the borders of the Orontes, before his settlement among the *Mardaites* of mount Libanus. One thing is certain, from the testimony of Tyrius, and other unexceptionable witnesses, as also from the most authentic records, *viz.* that the Maronites retained the opinions of the Monothelites until the twelfth century, when abandoning and renouncing the doctrine of one will in Christ, they were re-admitted to the communion of the Roman church. The most learned of the modern Maronites have left no method unemployed to defend their church against this accusation; they have laboured to prove, by a variety of testimonies, that their ancestors always persevered in the Catholic faith, in their attachment to the Roman pontiff, without ever adopting the doctrine of the Monophysites or Monothelites. But all their efforts are insufficient to prove the truth of these assertions to such as have any acquaintance with the history of the church, and the records of ancient times; for to all such, the testimonies they allege will appear absolutely fictitious and destitute of authority. Eccl. Hist. vol. ii.

Fauftus Nairon, a Maronite, settled at Rome, has published an apology for Maron, and the rest of his nation. His tenet is, that they really took their name from the Maron who lived about the year 400, and of whom mention is made in Chrysoftom, Theodoret, and the Menologium of the Greeks. He adds, that the disciples of this Maron spread themselves throughout all Syria; that they built several monasteries, and, among others, one that bore the name of their leader; that all the Syrians, who were not tainted with heresy, took refuge among them; and that, for this reason, the heretics of those times called them Maronites.

Volney traces the origin of the Maronites, called also *Marwardi*, at the end of the sixth age of the church, to a hermit named Maroun, who lived on the banks of the Orontes, and who, by his fasting, his reclusive mode of life, and his austerities, became much respected by the neighbouring people. It seems that, in the disputes which at that time arose between Rome and Constantinople, he employed his credit in favour of the western Christians. His death gave new energy to the zeal of his followers; and it was reported that miracles were wrought by his remains; hence many persons assembled from Kinefrin, Awafem, and other places, who built at Hama a chapel and a tomb, whence soon arose a convent, very celebrated in that part of Syria. As quarrels between the two metropolitan churches increased, a monk, named John the Maronite, about the end of the seventh century, obtained, by his talents for preaching, the reputation of being one of the most powerful supporters of the cause of the Latins, or partisans of the pope. Their opponents, who espoused the cause of the emperor, and were on this account called Melkites, or royalists, made at that time great progress in Lebanon. In order successfully to counteract them, the Latins sent among them

John the Maronite, who, having been presented to the agent of the pope at Antioch, and duly consecrated bishop of Djebail, was sent to preach in those countries. John, collecting his partisans, and augmenting their number, found it necessary to resist the force of the Melkites by force; and having assembled all the Latins, he settled with them at Lebanon, and there formed a society independent with respect to both its civil and religious government. John, having established order and military discipline among the mountaineers, and having provided them with arms and leaders, they employed their liberty in combating the common enemies of the empire and of their little state; and presently became masters of almost all the mountains as far as Jerusalem. A schism likewise took place among the Mahometans, which facilitated their conquests. After a variety of events, partly propitious and partly disastrous, about the year 1215 the Maronites effected a re-union with Rome, from which they were never widely separated, and which still subsists. William of Tyre, who gives this relation, observes that they had 40,000 men able to bear arms. The peace they enjoyed under the Mamlouks was disturbed by Selim II., but the time and attention of this prince being occupied about other objects, they joined the Druzes and their emir in making encroachments on the Ottomans; but these commotions issued unfortunately; for Amurath III., sending against them Ibrahim, pacha of Cairo, that general reduced them to obedience in 1588, and subjected them to the annual tribute which they still pay. Since that period, the pachas, desirous of extending their authority and extortions, have frequently attempted to introduce their garrisons and agas into the mountains of the Maronites; but being constantly repulsed, they have been compelled to abide by their treaties. The subjection of the Maronites, therefore, only consists in the payment of a tribute to the pacha of Tripoli, of whom they hold their country, which he annually farms out to one or more shaiks, that is, persons of eminence and property, who assign their respective shares to the districts and villages. This impost is levied chiefly on the mulberry-trees and vineyards, which are the principal, and almost the sole objects of culture. The form of government is founded, not on any express convention, but merely on usages and customs. This inconvenience would long ere this have produced disagreeable effects, if they had not been prevented by many fortunate circumstances. The principal of these is religion, which, placing an insurmountable barrier between the Maronites and the Mahometans, has precluded ambitious men from leaguuing themselves with foreigners to enslave their countrymen. The second is the nature of the country, which every where affording strong defences, enables every village, and almost every family, to oppose, by its single force, all usurpation of sovereign power. A third reason may be derived even from the weakness of this society, which having been always surrounded by powerful enemies, has only been able to resist them by maintaining union among its members, which union can only subsist by abtaining from oppressing each other, and by reciprocally guarding the safety of each others person and property. Thus the government preserves a natural equilibrium, and, customs supplying the place of laws, the Maronites are, to this day, equally strangers to the oppressions of despotism and the disorders of anarchy.

The nation may be considered as divided into two classes, the common people and the shaiks; by which must be understood the most eminent of the inhabitants, who, from the antiquity of their families, and the opulence of their fortunes, are superior to the ordinary class. They all live dispersed in the mountains, in villages, hamlets, and even detached

MARONITES.

tached houses; which is never the case in the plains. The whole nation consists of cultivators. Every man improves the little domain he possesses, or farms, with his own hands. Even the shaiks live in the same manner, and are only distinguished from the rest by a bad peliss, a horse, and a few slight advantages in food and lodging: they all live frugally, without many enjoyments, but also with few wants, as they are little acquainted with the inventions of luxury. In general, the nation is poor, but no one wants necessaries; and if beggars are sometimes seen, they come rather from the sea-coast than the country itself. Property is as sacred among them as in Europe, nor do we see there those robberies and extortions so frequent with the Turks. Travellers may journey there, either by night or day, with a security unknown in any other part of the empire, and the stranger is received with hospitality, as among the Arabs; it must be owned, however, that the Maronites are less generous, and rather inclined to the vice of parsimony. Conformably to the doctrines of Christianity, they have only one wife, whom they espouse frequently, without having seen, and, always without having been much in her company. Contrary to the precepts of that same religion, however, they have admitted, or retained, the Arab custom of retaliation, and the nearest relation of a murdered person is bound to avenge him. From a habit founded on distrust, and the political state of the country, every one, whether shaik or peasant, walks continually armed with a musket and poniards. This is, perhaps, an inconvenience; but this advantage results from it, that they have no novices in the use of arms among them, when it is necessary to employ them against the Turks. As the country maintains no regular troops, every man is obliged to join the army in time of war, and if this militia were well conducted, it would be superior to many European armies. From accounts taken in late years, the number of men, fit to bear arms, amounts to thirty-five thousand. According to the usual mode of computation, this would imply a population of about a hundred and five thousand souls; and, if we add the priests, monks, and nuns, dispersed in upwards of two hundred convents, and the inhabitants of the maritime towns, such as Djebail, Batroun, &c. we cannot suppose it less than a hundred and fifteen thousand.

This number, compared with the extent of the country, which is about a hundred and fifty leagues square, gives seven hundred and sixty inhabitants for each square league; which will not appear a small population, when we consider that great part of Lebanon consists only of barren rocks, and that the soil, even where it can be cultivated, produces very little.

In religious matters, the Maronites are dependent on Rome. Though they acknowledge the supremacy of the pope, their clergy continue, as heretofore, to elect a head, with the title of *Batrak*, or patriarch of Antioch. Their priests marry, as in the first ages of the church; but their wives must be maidens, and not widows, nor can they marry a second time. They celebrate masses in Syriac, of which the greatest part of them comprehend not a word. The gospel, alone, is read aloud in Arabic, that it may be understood by the people. The communion is administered in both kinds. The Host is a small round loaf, unleavened, of the thickness of a finger, and something larger than a crown piece. On it is the impression of a seal, which is eaten by the priest, who cuts the remainder into small pieces, and, putting them into the cup, administers to each person with a spoon which serves every body. These priests have not, as among us, benefices or stated revenues; but they subsist on the produce of their masses, the bounty of their hearers, and the labour of their hands. Some of them exercise

trades, others cultivate a small piece of land, and all are industriously employed, for the maintenance of their families, and the edification of their flock. Their poverty is recompensed by the great respect which is paid them; their vanity is incessantly flattered; whoever approaches them, whether rich or poor, great or small, is anxious to kiss their hands, which they fail not to present; nor are they pleased that the Europeans withhold this mark of reverence, so repugnant to our manners, though not thought humiliating by the natives, who are accustomed to it from their infancy. In other respects, the ceremonies of the Catholic religion are not performed more publicly, or with less restraint, in Europe than in the Kefraouan. Each village has its chapel and its priest, and each chapel its bell: a thing unheard of in any other part of Turkey. The Maronites are vain of this privilege, and that they may not be deprived of it, will not suffer a Mahometan to live among them. They assume to themselves, also, the privilege of wearing the green turban, which, except in their territories, would cost a Christian his life.

In the small country of the Maronites there are reckoned upwards of two hundred convents for men and women. These religious are of the order of St. Anthony, whose rules they observe with an exactness which reminds us of earlier times. The dress of the monks is made of brown coarse woollen stuff, and resembles that of the Capuchin friars in Europe. Their food is the same as that of the peasants, with this exception, that they never eat flesh. They observe frequent fasts, and make long prayers at stated hours in the night as well as the day; the remainder of their time is employed in cultivating the earth, or breaking the rocks to form the walls of the terraces which support their vineyards and mulberry plantations. Each convent has a brother shoemaker, a brother taylor, a brother weaver, a brother baker; in a word, an artist of every necessary trade. We almost always find a convent of women close to one of men; yet it is rare to hear of any scandalous report. These women themselves lead a very laborious life, and it is this activity, doubtless, which secures them against all the mischiefs attendant on idleness. So far, therefore, from being injurious to population, we may affirm that these convents have contributed to promote it, by increasing by culture every article in a proportion greater than its consumption. The most remarkable of the houses of the Maronite monks is *Kozhaia*, six hours journey to the east of Tripoli. There they exorcise, as in the first ages of the church, those who are still possessed with devils; for such persons are still to be found in these countries. From the account, says Volney, given me by intelligent observers, it appears that those possessed are no other than persons afflicted with idiocy, madness and epilepsies; and it is worth remarking, that possession and epilepsies are denoted by the same Arabic word, *kabal* and *kabat*.

The court of Rome, in affiliating the Maronites, has granted them an hospital, at Rome, to which they may send several of their youth, to receive a gratuitous education. It should seem that this institution might introduce among them the ideas and arts of Europe; but the pupils of this school, limited to an education purely monastic, bring home nothing but the Italian language, which is of no use, and a stock of theological learning, from which as little advantage can be derived; they accordingly soon assimilate with the rest. Nor has a greater change been operated by the three or four missionaries maintained by the French capuchins at Gazir, Tripoli, and Bairout. Their labours consist in preaching in their church, in instructing children in the catechism, Thomas à Kempis, and the Psalms, and in teaching them to read and write. Formerly the Jesuits had

had two missionaries at their house at Antoura, and the Lazarites have now succeeded them in their mission. The most valuable advantage that has resulted from these apostolical labours is, that the art of writing has become more common among the Maronites, and rendered them, in this country, what the Copts are in Egypt; that is, they are in possession of all the points of writers, intendants, and kiayas among the Turks, and especially of those among their allies and neighbours, the Druzes. Volney's Travels in Egypt and Syria, vol. ii.

Mosheim observes, that the subjection of the Maronites to the spiritual jurisdiction of the Roman pontiff, was agreed to with this express condition, that neither the popes nor their emissaries should pretend to change or abolish any thing that related to the ancient rites, moral precepts, or religious opinions of this people: so that, in reality, there is nothing to be found among the Maronites that favours of popery, if we except their attachment to the Roman pontiff, who is obliged to pay very dear for their friendship. For, as the Maronites live in the utmost distress of poverty, under the tyrannical yoke of the Mahometans, the bishop of Rome is under the necessity of furnishing them with such subsidies as may appease their oppressors, procure a subsistence for their bishop and clergy, provide all things requisite for the support of their churches, and the uninterrupted exercise of public worship, and contribute in general to lessen their misery. It is certain that there are Maronites in Syria, who still behold the church of Rome with the greatest aversion and abhorrence; nay, what is still more remarkable, great numbers of that nation residing in Italy, even under the eye of the pontiff, opposed his authority during the 17th century, and threw the court of Rome into great perplexity. One body of these non-conforming Maronites retired into the vallies of Piedmont, where they joined the Waldenses; another, above six hundred in number, with a bishop, and several ecclesiastics at their head, flew into Corsica, and implored the protection of the republic of Genoa, against the violence of the inquisitors. Eccl. Hist. vol. iii.

The Maronites have a patriarch, who resides in the monastery of Cannubin, on mount Libanus, and assumes the title of patriarch of Antioch, and the name of Peter, as if he seemed desirous of being considered as the successor of that apostle. He is elected by the clergy and the people, according to the ancient custom; but, since their re-union with the church of Rome, he is obliged to have a bull of confirmation from the pope. He keeps a perpetual celibacy, as well as the rest of the bishops his suffragans: as to the rest of the ecclesiastics, they are allowed to marry before ordination; and yet the monastic life is in great esteem among them. The monks are of the order of St. Anthony, and live in the most obscure places in the mountains, far from the commerce of the world.

As to their faith, they agree in the main with the rest of the Eastern church. Their priests do not say mass singly; but all say it together, standing round the altar. They communicate in unleavened bread; and the laity have hitherto partaken in both kinds, though the practice of communicating in one has of late been getting footing, having been introduced by little and little. In Lent they eat nothing, unless it be two or three hours before sun-rising: their other fastings are very numerous.

MAROO, in *Geography*, a town of Hindoostan, in the circar of Ruttunpour; 18 miles N.W. of Ruttunpour.

MAROON, *To*, in *Sea Language*, is to put one or more sailors ashore upon a desolate island, under the pretence of their having committed some great crime. This detestable expedient has been repeatedly practised by some inhuman

commanders of merchant-ships, particularly in the West Indies.

MAROONGAS, in *Geography*, a small island in the Sooloo Archipelago. N. lat. 6° 3'. E. long. 120° 58'.

MAROONS. See JAMAICA.

MARROOTS, ORAN IDAANS, or *Idabans*, people who inhabit the N. part of the island of Borneo, near and upon the skirts of the high mountain of Keneebaloo; called, in old maps, "St. Peter's Mount." These people believe that the deity is pleased with human victims. An Idaan or Maroot mult, once at least in his life, have imbrued his hands in a fellow-creature's blood. The rich are said to do it often, adorning their houses with skulls and teeth, to shew how much they have honoured their author, and laboured to avert his chastisement. Several in low circumstances will club to buy a Bifayan Christian slave, or any one that is to be sold cheap; that all may partake the benefit of the execution. Some also believe that those, whom they kill in this world, will serve them in the next. They are acquainted with a subtle poison, called *ippoo*, the juice of a tree, in which they dip small darts; and these they shoot through a hollow piece of wood, called by the Sooloos "Sampit," from which issues instant death, to any one who is wounded by them. The Idaaans pen hogs, and eat pork. They carry their rice, fruits, &c. to the sea-side, and buy salt from the Badjoos, who often manufacture it by gathering sea-weeds and burning them, making a ley of ashes, filtering it, and forming a better kind of salt in square pieces, by boiling it in pans made of the bark of the anebong. These pieces of salt are carried to market, whither both the Idaaans and Mussulmen resort, and pass as a currency for money. The Mahometans preclude Europeans, as much as they can, from having intercourse with the Idaaans and Maroots; but at Balambangan, and on the island Labuan, near Borneo, the Idaaans in their boats bring hogs, fruits, &c. and are glad to see the English eat pork like themselves. *Forest's Voyage*.

MAROS, a town on the W. coast of the island of Celebes. N. lat. 4° 47'. E. long. 120° 6'.

MAROS, a river of Hungary, which rises on the borders of Moldavia, and runs into the Theysse, near Zegedin.

MAROSTICA, a town of Italy, in the Vicentin, encompassed with walls, and containing several churches; 11 miles N. of Vicenza.

MAROTIC STYLE, in the *French Poetry*, denotes a peculiarly gay, pleasant, yet simple and natural manner of writing, introduced by Clement Marot, and since imitated by other authors, but with most success by De la Fontaine and Rousseau.

The difference between the Marotic and the burlesque style is thus assigned: the Marotic makes a choice; the burlesque admits of all. The first is the most simple; but its simplicity has its nobleness; and, where its own age will not furnish natural expressions, it borrows them from former times: the latter is low and grovelling, and borrows false and fustian ornaments from the crowd, which people of taste despise. The one resigns itself to Nature; but examines, first of all, whether the objects she presents be fit for its paintings, and takes nothing but what carries with it somewhat of delicacy and mirth: the other runs headlong into buffoonery, and affects every thing that is extravagant and grotesque. See BURLIQUES.

MAROTTI, in *Botany*, is a tall tree growing in Malabar, with leaves like those of the bay, bearing a round oblong fruit, including a very large, hard, and yellowish stone, containing ten or eleven kernels. The oil extracted from the seeds or kernels of the fruit, eases pains, and cures the

scabies and itchings, being rubbed on the parts: it is good also for eyes infested with salt humours; and, mixed with ashes, it is successfully applied to imposthumes and abscesses in cows, and other cattle, and beasts of burden. Raii Hist. Plant.

MAROUPOLE, in *Geography*, a town of Austrian Poland, in Galicia; 60 miles E.N.E. of Lemberg.

MAROWLY, a town of Hindooistan, in the circar of Gohud; 15 miles S. of Narwa.

MAROZZO, a town of Naples, in Abruzzo Citra; 20 miles S.E. of Lenciano.

MARPACH, a town of Austria; 6 miles E. of Steyr-ragg.—Also, a town of Wurtemberg, on the Neckar; 8 miles N.N.E. of Stuttgart. N. lat. 48° 58'. E. long. 9° 21'.

MARPESUS, the most lofty mountain in the island of Paros, situated W. of the harbour of Marmora, which furnished more particularly the marble obtained by the Greeks from Paros.

MARPESSUS, in *Ancient Geography*, a town of Phrygia, on mount Ida. Pausanias (l. x. c. 12.) places it among the Phocians, at 240 stadia from Alexandria of the Troade, in the vicinity of the river Ladon.

MARPURG, FREDERIC WILHELM, in *Biography*, an eminent and voluminous writer on music, and a composer, at Berlin, whose works on the theory and practice of the art may be justly said to surpass in number and utility those of any other author who has treated on the subject. He was, perhaps, the first German theorist who could patiently be read by persons of taste, so addicted were former writers to prolixity and pedantry.

This author's *coup d'essai*, as a musical writer, was a periodical work, entitled "The Musical Critic on the Spree, 1747." Then followed his "Art of playing the Harpsichord, in Three Parts," from 1750 to 1755. After which "A Treatise upon Fugue and Counterpoint," in German, 1753, and in French, 1756. This is the best book of the kind that is extant, except Padre Martini's "Saggio di Contrappunto," which, for vocal fugues, is perhaps superior; but for instrumental, M. Marpurg's work is still more useful. The historical part, however, is scanty and inaccurate: for, in the enumeration of organists of different countries, though M. Marpurg, who had been in France and civilly treated there, is very grateful, yet he mentions no English composer of any kind but the feeble and flimsy Felting, who, though a worthy man and much esteemed by his friends, was far from a great player or good composer. Among organists, he just mentions Stanley and Keeble; but of Handel's sublime oratorio choruses and manner of playing the organ he is wholly silent; nor does he ever seem to have heard of our Roseingrave, Magnus, J. James, Kelway, or Worgan, who, in 1756, was an excellent extempore fughist. And the examples of canon and fugue are too indiscriminately given to serve as models of excellence to young students. Indeed, M. Marpurg was so ingenuous as to confess to us, at Berlin, that he had injured his work by partiality to friends, whose productions he had frequently cited, against his judgment. About this time, 1756, fugues began to lose their favour, even in Germany, where their reign had been long and glorious; but Rousseau's "Lettre sur la Musique Françoise," and the beautiful melody, taste, expression, and effects of theatrical compositions, so much cultivated in Italy and in all the German courts, brought about a general revolution in music, which Vinci, Haffe, and Porpora began, and Pergolesi finished. In 1754, M. Marpurg began the publication of his "Historical and Critical Essays towards the Advance-

ment of Music;" this work was closed in 1762, and consists of five volumes octavo. These essays, with his "Critical Letters on the Art of Music," from 1760 to 1762, called the attention of Germany to musical criticism; which Hiller's weekly essays on the same subject continued from 1764 to 1770. The chief of M. Marpurg's works, theoretical and practical, which are very numerous, were published between 1749 and 1763, about which time he was appointed by the king of Prussia secretary of affize. After this he devoted his whole time to political calculations, except what he bestowed on musical ratios in an "Essay on Temperament," to which he added an appendix on Rameau's and Kirnberger's rules for accompaniment or thorough-bass, 1770, 8vo.

Of M. Marpurg's compositions in music, though much original genius may not be discoverable in them, they are clear and correct; and if they do not excite rapture by strokes of novelty, fire, or pathos, they can never offend. But he was surrounded at Berlin by musicians of the highest order; by the Grauns, the Bendas, Emanuel Bach, &c. and he had no chance of rivalling them in point of genius; but as a writer on musical subjects, he certainly surpassed all his predecessors and contemporaries in the German language, in clearness, elegance, and extensive acquaintance with the history and rules of the art.

MARPURG, in *Geography*. See MARBURG.

MARQUARTSBURG, a town of Germany, in the territory of Nuremberg; 9 miles N.N.E. of Nuremberg.

MARQUARTSTEIN, a town of Bavaria, on the Ache; 25 miles W. of Salzburg.

MARQUE, LA, a town of France, in the department of the Gironde; 18 miles N.N.W. of Bourdeaux.

MARQUE, *Law of*. See LAW.

MARQUE, *Letters of*, are letters of reprisal granted by a king or state, whereby the subjects of one country are licensed to make reprisals on those of another; by reason application has been made for redress to the government to which the aggressor belongs, three times without effect.

The first letter of marque, of which we have any account in the history of this country, was issued by Edward I. in 1295, against the subjects of Portugal.

These letters are grantable by the law of nations, whenever the subjects of one state are oppressed and injured by those of another; and justice is denied by that state to which the oppressor belongs: and with us it is declared by stat. 4 Hen. V. cap. 7, that if any subjects of the realm are oppressed in time of truce by any foreigners, the king will grant marque in due form, to all that feel themselves aggrieved. Which form is thus directed to be observed: the sufferer must first apply to the lord privy-seal, and he shall make out letters of request under the privy-seal: and if, after such request of satisfaction made, the party required do not, within convenient time, make due satisfaction or restitution to the party grieved, the lord chancellor shall make him out letters of marque, under the great seal: and by virtue of these he may attack and seize the property of the aggressor nation, without hazard of being condemned as a robber or pirate. Blackst. Com. vol. i.

They are so called from the German *marcke, limit, frontier*; as being *jus concessum in alterius principis marcas seu limites transcundi, sibi que jus faciendi*; as being a right of passing the limits or frontiers of another prince, and doing oneself justice. See LETTERS and REPRISALS.

In matters of insurance, if, after a policy is effected on a merchant-ship, letters of marque be put on board, and from a mere private trader, she is changed into a ship of war, with

power not only to defend herself, but to cruise and take prizes; this is such an alteration of the condition of the ship, that the risk must be materially changed from that which the underwriter took upon himself, and consequently the contract is thereby determined. Thus, a case occurs, in which a ship, insured as a private trader, afterwards takes letters of marque, without the consent of the underwriters, this discharges the underwriters, though no use be made of the letters of marque. In another case, letters of marque were taken out, but without the proper certificate, and only to entice seamen to enter, without any intention of cruising; this did not vary the risk, so as to avoid the policy, even though the captain, against his instructions, cruised and took prizes. When the seamen were procured, these letters of marque could have no legal effect, and thus it was the same as if no letters of marque had been on board. When no certificate of clearance is taken out, in pursuance of the stat. 33 Geo. III. c. 66, the letters of marque are declared void; and the captain is subjected to a penalty for departing without it.

MARQUESAS, LES MARQUISSES, or *Marquis of Mendocua's Islands*, a group of islands in the South Pacific ocean, first discovered in 1595 by Alvaro Mendana de Neyra; and visited by Capt. Cook in the year 1774, by Marchand in 1791, and by the Missionaries in 1797; of which we have an account by these several navigators, and also by Mr. George Forster, Mr. Reinhold Forster, Capt. Chanal, and surgeon Roblet. These islands are five in number, viz. La Magdalena or Madalena, at the distance of eight leagues to the south by east from the middle of the group, nearly in the latitude of $10^{\circ} 25'$, long. $138^{\circ} 50'$; St. Pedro or O-Niteio, about three leagues in circuit, and of a good height, lying south, $4\frac{1}{2}$ leagues from the E. end of La Dominica, not known by Capt. Cook to be inhabited; La Dominica or O-Hivahoa. (See LA DOMINICA.) Figueroa, in his account of Mendana's voyage, represents this island as exhibiting an enchanting aspect: according to him, vast plains displayed a smiling verdure, and divided hills, which rose with a gentle acclivity, and were crowned by tufted woods; while a numerous population announced the richness and fertility of the soil. However, after an interval of two centuries, that elapsed between the two voyages of Mendana and Cook, this island presented to Mr. G. Forster a very different appearance. He describes it as a high and mountainous island, of which the N.E. point is very steep and barren; but farther to the N. he observed some vallies filled with trees, among which was now and then discovered a hut. As the haze cleared away, "we saw," says this writer, "many craggy rocks like spires, and several hollow summits piled up in the centre of the island, which proves that volcanoes and earthquakes had been active there in changing the face of the country. All its eastern part is a prodigious steep and most perpendicular wall, of a great height, which forms a sharp ridge, shattered into spires and precipices." This difference of appearance, according to the descriptions of two writers, is ascribed by Marchand to the terrible effect of one of those great convulsions of nature, which totally disfigure the parts of the surface of the globe on which their ravage is exercised. The next island is Santa Christina, or *Christiana*, which see; and Hood's island, which is the northernmost, situated in S. lat. $9^{\circ} 26'$, and N. $13^{\circ} W.$, $5\frac{1}{2}$ leagues distant from the E. point of La Dominica. (See HOOD'S ISLAND.) These isles occupy one degree in latitude; and near half a degree in longitude, viz. from $138^{\circ} 47'$, to $139^{\circ} 13' W.$, which is the longitude of the W. end of La Dominica. The trees, plants, and other productions of these isles, says

Capt. Cook, so far as we know, are nearly the same as at Otaheite, and the Society Isles. The refreshments they afford are hogs, fowls, plantains, yams, and some other roots; likewise bread-fruit and cocoa-nuts, but of these not many. At first these articles were purchased with nails, beads, looking-glasses, and such trifles, which were so highly valued at the Society Isles, but were in no esteem here; and even nails, at last, lost their value for other articles far less useful. The inhabitants of these islands, collectively, are without exception the finest race of people in this sea. For fine shape and regular features, they perhaps surpass all other nations. Nevertheless, the affinity of their language to that spoken in Otaheite and the Society Isles, shews that they are of the same nation. The men are punctured, or curiously *tattooed*, from head to foot. The figures are various, and seem to be directed more by fancy than custom. These punctures make them appear dark; but the women, who are but little punctured, youths, and young children who are not at all, are as fair as some Europeans. The men are, in general, tall; that is, about five feet ten inches, or six feet; but none were observed fat and lusty like the "Earees" of Otaheite, nor were any seen that could be called meagre. Their teeth are not so good, nor are their eyes so full and lively as those of many other nations. Their hair, like ours, is of many colours, except red, of which Capt. Cook saw none. Some have it long, but the more general custom is to wear it short, except a bunch on each side of the crown, which they tie in a knot. They observe different modes in trimming the beard, which is, in general, long. Some part it, and tie it in two bunches under the chin; others plait it; some wear it loose, and others quite short.

Their clothing is the same as at Otaheite, and made of the same materials; they are neither so plentiful nor so good. The men have, for the most part, nothing to cover their nakedness, except the "Marra," as it is called at Otaheite; which is a slip of cloth passed round the waist and betwixt the legs. This simple dress is sufficient for the climate, and answers every purpose which modesty requires. The dress of the women is a piece of cloth, wrapped round the loins like a petticoat, which reaches down below the middle of the leg, and a loose mantle over the shoulders. Their principal head-dress, which appears to be their chief ornament, is a sort of broad fillet, curiously wrought of the fibres of the husk of cocoa-nuts. In the front is fixed a mother-of-pearl shell, wrought round to the size of a tea-saucer. Before that, another, smaller, of very fine tortoise-shell, perforated into curious figures. Also before, and in the centre of that, is another round piece of mother-of-pearl, about the size of half a crown; and before this another piece of perforated tortoise-shell, the size of a shilling. Besides this decoration in front, some have it also on each side, but in smaller pieces; and all have fixed to them the tail-feathers of cocks or tropic-birds, which, when the fillet is tied on, stand upright; so that the whole together makes a very sightly ornament. They wear round the neck a kind of ruff or necklace, made of light wood, the outer and upper side being covered with small red peas, which are fixed on with gum. They also wear small bunches of human hair, fastened to a string, and tied round the legs and arms. Sometimes, instead of hair, they make use of short feathers; but all the above-mentioned ornaments are seldom seen on the same person. Their ordinary ornaments are necklaces and amulets made of shells, &c. None were observed with ear-rings, and yet all had their ears pierced. Their dwellings are in the vallies, and on the sides of the hills, near their plantations. They are

MARQUESAS.

built like those of Otaheite; but much meaner, and only covered with the leaves of the bread-tree. Most of them are built on a square, or oblong pavement of stone, raised some height above the level of the ground. They have also such pavements near their houses, on which they sit to eat and amuse themselves. In their mode of eating, these people, says Capt. Cook, are not so cleanly as the Otaheiteans. In their cookery they were also dirty. Pork and fowls are dressed in an oven of hot stones, as at Otaheite; but fruit and roots they roast on the fire, and after taking off the rind or skin, put them into a platter or trough with water, out of which men and hogs eat at the same time. Capt. Cook could not say, whether it was the custom for men and women to have separate messes.

They seemed to have dwellings, or strong holds, on the summits of the highest hills. Their weapons are clubs and spears, resembling those of Otaheite, but somewhat neater. They have also slings, with which they throw stones with great velocity, and to a great distance, but not with a good aim. Their canoes are made of wood, and pieces of the bark of a soft tree, which grows plentifully near the sea, and is very tough and proper for the purpose. They are from 16 to 20 feet long, and about 15 inches broad; the head and stern are made of two solid pieces of wood; the stern rises or curves a little, but in an irregular direction, and ends in a point; the head projects out horizontally, and is carved into some rude resemblance of a human face. They are rowed by paddles, and some have a sort of latteen sail made of matting. Hogs were the only quadruped seen by our navigators; and cocks and hens the only tame fowls. However, the woods seemed to abound with small birds of a very beautiful plumage, and fine notes; but the fear of alarming the natives hindered their shooting so many of them as they might otherwise have done. For further particulars relating to the disposition and manners, &c. of the Mendocans, we refer to captain Marchand's account, given under the article *Santa CHRISTIANA*. We shall here add some relations, that serve to correct or to enlarge the account of these people furnished by Capt. Cook. Capt. Chanal, cited by Marchand, is very far from confirming the reproach of filthiness, which Capt. Cook has applied to these islanders; he says, on the contrary, that, having repeatedly been present at their meals, for which men, women, and children of the same house assemble twice a day, at noon and before night-fall, he was surprised at the great cleanliness which prevailed, and which is observable in their whole habitation; he adds, that he has seen the inhabitants of La Madre de Dios, in the island of Santa Christiana, make very frequent use of water for washing themselves. Surgeon Roblet also says, that both men and women pass whole days in the water. To their frequent use of water, is ascribed their freedom from cutaneous diseases, pimples, ulcers, &c. which are common in the burning climates of the torrid zone. It is affirmed, that in various respects they are more cleanly than the inhabitants of Otaheite, extolled by Capt. Cook. Their diet, it is observed, is more vegetable than animal. From the cocoa-nut they extract an oil, which is probably employed in the seasoning of their dishes; and which is principally used to anoint their whole body; and the women especially consume a great quantity of it for maintaining the gloss and beauty of their hair. Their common drink is pure water, and, occasionally, cocoa-nut milk. As they have the pepper-root, and make use of it as a sign of peace, it is supposed, that they may also prepare the same dainty beverage from it, with which the other islanders intoxicate themselves. Capt. Chanal presumes, not without reason, that they procure a strong liquor from the root of ginger,

rather than from that of pepper. This beverage, however, they use with moderation, for Marchand says, that no individual was seen here, who manifested the slightest appearance of intoxication. Their mode of building their houses on stone platforms, and their use of stilts, the structure of which is particularly described by Marchand, indicate that the island of Christina must be exposed to inundations. Of these stilts, curiously constructed, the natives of this island make a very dextrous use; and it is said, that in a race, they would dispute the palm with the most experienced herdsman of France.

It does not appear that in Santa Christina, they have either laws or chiefs; strength being every thing, and the weak obeying the strong. Of their religion, we have no better information than of their government. During the stay which the French made in this island, they saw nothing which could make them think, that its inhabitants paid any worship to a supreme being; pleasure, says Marchand, is the divinity of the country; no superstition, no ceremony, no priest or juggler. In the Missionary voyage, we have the following account of the customs and manners of the people about Resolution bay, more especially as they relate to religion, and they are different from the account given by the French voyagers. "Their religious ceremonies resemble those of the Society islands. They have a *Morai* in each district, where the dead are buried beneath a pavement of large stones, but with such exceptions, as in the case of the chief *Hōnoo*. They have a multitude of deities. Those most frequently mentioned are *Opoamane*, *Okeco*, *Oenamoe*, *Opepeetye*, *Onooko*, *Oetanow*, *Fatu-ait-poo*, *Onoetye*; but none who seem superior to the rest, though the extent of my information (says the Missionary) is small on this head. They only offer hogs in sacrifices, and never men. The chief *Tēnae* presides over four districts, *Ohitahoo*, *Takeway*, and *Innamei*, all opening into Resolution bay, and *Onopoho*, the adjoining valley to the southward. He has four brothers; but none of them seem invested with any authority; and *Tēnae* himself with less than the Otaheitean chiefs. There is no regular government, established law, or punishment; but custom is the general rule."

As to their food, we are informed that they have no regular meals, but eat when they are hungry. When they have a hog, they eat of it five or six times a day; and when without animal food, they use the roasted bread-fruit, fish, mahie, pudding made of it and other vegetables, ahee-nuts, and a palle made of a root resembling the yam; and this they often do through the day. The women are not allowed to eat hog, and are probably restrained by other prohibitions as at Otaheite, and seem much more servile to the men, and harshly treated. They are employed in making cloth and matting, but not in cookery, except for themselves. "I have never observed (says one of the missionaries) any of the men, from the chief to the toutou, at work, except a few old persons making cords and nets: the rest idle about, and bask in the sun, telling their stories, and beguiling the time." As far as concerns the persons, dress, canoes, &c. of these people, the missionaries found them exactly as they are described in Cook's second voyage.

As to the population of these islands, we have no satisfactory account. The number of inhabitants, says Mr. G. Forster, cannot be very considerable, on account of the small size of the islands which they occupy. Such spots as are fit for culture in these islands are very populous; but as they are all very mountainous, and have many inaccessible and barren rocks, it is to be doubted whether the whole population of this group amounts to 50,000 persons. From Marchand's voyage, and the statement which it contains, it appears

appears that it would be granting much to the island of Santa Christina to give it 1000 inhabitants for every league of coast, and in all, 7000; to suppose 6000 in La Dominica, which Mr. Forster, on account of the sterility of the greater part of its soil, rightly presumes not likely to present a population so numerous as that of S. Christina: and to admit 6000 for La Madalena, whose circuit is six leagues: the total number of the inhabitants of the three large islands might then amount to 19,000 individuals, which might be extended to 20,000, if we allow a few inhabitants to the small islands San Pedro and Hood's island. This result is very wide of that of 50,000 individuals according to Mr. Forster's statement; and yet this is supposed by the French voyager to be exaggerated. Cook's Second Voyage, vol. i. Marchand's Voyage, vol. i. Missionary Voyage.

MARQUETRY, *Inlaid Work*; a curious kind of work, composed of pieces of hard fine wood of different colours, flattened, in thin slices, on a ground, and sometimes enriched with other matters, as tortoise-shell, ivory, tin, and brass.

There is another kind of marquetry made, instead of wood, of glasses of various colours; and a third, where nothing but precious stones, and the richest marbles, are used: but these are more properly called *mosaic work*. The art of inlaying is very ancient, and is supposed to have passed from the east to the west, as one of the spoils brought by the Romans from Asia. Indeed, it was then but a simple thing; nor did it arrive at any tolerable perfection till the fifteenth century, among the Italians. It seems finally to have arrived at its height in the seventeenth century, among the French.

Till John of Verona, contemporary with Raphael, the finest works of this kind were only black and white, which are what we now call *morelcos*; but that religious, who had a genius for painting, stained his woods with dyes, or boiled oils, which penetrated them. But he went no farther than the representing of buildings and perspectives, which require no great variety of colours. Those who succeeded him, not only improved on the invention of dyeing the woods, by a secret which they found of burning them without consuming, which served exceedingly well for the shadows; but they had also the advantage of a number of fine new woods of naturally bright colours, by the discovery of America. With these assistances, the art is now capable of imitating any thing; whence some call it, the *art of painting in wood*. The ground, whereon the pieces are to be arranged and glued, is ordinarily of oak or fir, well dried; and, to prevent warping, it is composed of several pieces glued together. The wood to be used, being reduced into leaves of the thickness of a line, is either stained with some colour, or made black for shadow: which some effect by putting it in sand extremely heated over the fire; others by steeping it in lime-water and sublimate; and others, in oil of sulphur. Thus coloured, the contours of the pieces are formed according to the parts of the design they are to present.

The last is the most difficult part of marquetry, and that wherein most patience and attention are required. The two chief instruments used herein are the saw and the vice; the one to hold the matters to be formed: the other to take off from the extremes, according to occasion. This vice is of wood, having one of the chaps fixed, the other moveable, and is opened and shut by the foot, by means of a cord fastened to a treadle. Its structure is very ingenious, yet simple enough, and will be easily conceived from the figure, *Plate XXIII. Miscellany, fig. 3.* The leaves to be formed (for there are frequently three or four of the same kind formed together) are put within the chaps of the vice, after being glued

on the outermost part of the design, whose profile they are to follow: then the workman, pressing the treadle, and thus holding fast the piece, with his saw runs over all the outlines of the design. By thus joining and forming three or four pieces together, they not only gain time, but the matter is likewise the better enabled to sustain the effort of the saw; which, how delicate soever it may be, and how lightly soever the workman may conduct it, without such a precaution, would be apt to raise splinters, to the ruin of the beauty of the work.

When the work is to consist of one single kind of wood, or of tortoise-shell, on a copper or tin ground, or *vice versa*, they only form two leaves on one another, *i. e.* a leaf of metal, and a leaf of wood or shell: this they call sawing in counter-parts; for by filling the vacuities of one of the leaves by the pieces coming out of the other, the metal may serve as a ground to the wood, and the wood to the metal.

All the pieces, thus formed with the saw, are marked, to know them again; and the shadow being given in the manner already mentioned; they veneer or fasten each in its place on the common ground; using for that purpose the best English glue. The whole is then put in a press to dry, planed over, and polished with the skin of the sea-dog, wax, and shave-grass, as in simple veneering; with this difference, however, that in marquetry, the fine branches, and several of the most delicate parts of the figures, are touched up, and finished with a graver.

They are the cabinet-makers, joiners, and toy-men, among us, who work in marquetry; and the enamellers and stone-cutters who deal in mosaic work: the instruments used in the former are mostly the same with those used by the ebonists. See **EBONY**.

MARQUIE, or **MARQUEE**, Fr. corrupted from *Marquise*, signifies a tent or cover made of strong canvas or Russian duck, which is thrown over another tent, and serves to keep out rain.

MARQUION, in *Geography*, a town of France, in the department of the Straits of Calais, and chief place of a canton, in the district of Arras. The place contains 608, and the canton 14,293 inhabitants, on a territory of 137½ kilometres, in 17 communes.

MARQUIS, or **MARQUESS**, *Marchio*, a title given to a person in possession of a considerable demesne erected into a marquisate by letters patent; holding a middle place between the dignity of a duke and that of an earl or count.

The word, according to some authors, comes from the *Marcomanni*, an ancient people, who inhabited the marches of Brandenburg. Others derive it from the German *marche*, *limit*; and others from *marcissa*, which, in the Celtic language, signified a *wing of cavalry*. Nicod derives it from the corrupt Greek *σομαρχία*, *province*. Alciat and Pauchet bring it from *marc*, *horse*, taking a marquis to be properly an officer of horse. Menage derives it from *marca*, *frontier*; and Selden, Krantzius, and Hottoman; do the same. Lastly, Pasquier fetches marquis from the old French *marche*, *limit*; or from *marchir*, *to confine*; the guard of the frontiers being committed to them. Marquises were anciently governors of frontier cities or provinces, called *marches*. Such as, in particular, were the marches of Wales and Scotland, while each continued to be an enemy's country. In Germany, they are called *marograves*.

The persons, who had command there, were called lords marchers, or marquises; whose authority was abolished by statute 27 Hen. VIII. c. 27; though the title had long before been made a mere ensign of honour; Robert Vere, earl of Oxford, being created marquis of Dublin by Richard

chard II. in the eighth year of his reign. 2 Inst. 5. Selden's Titles of Honour, p. 216.

Marquis is originally a French title: the Romans were unacquainted with it. In the Notitia Imperii, they were called *comitates limitanci*. The first time we hear of *marquises*, *marchiones*, is under Charlemagne, who created governors in Gascony under this denomination.

Alciat has started a question, whether a marquis or count should have the precedence? To decide it he goes back to the ancient function of counts; and observes, that counts, who are governors of provinces, are above marquises, who are only governors of frontiers; and that marquises, who are governors of frontier cities, are above those counts who are governors of small towns. He adds, that, in consequence of this distinction, the book of fiefs sometimes places marquises above counts, and sometimes counts above marquises.

Froissart observes, that the marquise of Juliers was erected into a county: but now-a-days, neither marquises nor counts are any longer governors; and as they are mere titles of honour, the counts make no scruple of resigning the precedence.

MARQUIS'S *Coronet*. See CROWN.

MARQUIS, *Grand*, in *Geography*, a town on the E. side of the island of Grenada. N. lat. 12° 9'. W. long. 61° 1'.

MARQUIS, *Cape*, a cape on the N. coast of the island of St. Lucia. N. lat. 13° 50'. W. long. 6° 42'.

MARQUIS *Islands*, a cluster of small islands in the Florida stream. N. lat. 24° 35'. W. long. 82° 30'.

MARQUISE, a town of France, in the department of the Straits of Calais, and chief place of a canton, in the district of Boulogne. The place contains 1400, and the canton 9262 inhabitants, on a territory of 232½ kilometres, in 21 communes.

MARR, a division of the county of Aberdeen, in Scotland, towards the south, between the rivers Dee and Don.

MARRA, in *Ancient Geography*, a town of Asia, in Syria, situated on an extensive plain, to the E. of the river Orontes, N.E. of Apamea, and S. of Chalcis. Marra still retains its ancient name, and is held by the pacha of Damascus, as an appanage deriving immediately from the sultan. Homs, Hama, and Marra pay 400 purfes, or about 20,000*l.*; 30 miles N. of Hama.

MARRABOO, a town of Africa, in the kingdom of Bambarra, on the Niger: this town is a considerable mart for salt, which is brought by the Moors for sale to the Negroes; 150 miles S.W. of Sego. N. lat. 12° 50'. W. long. 5° 10'.

MARRADI, a town of Etruria; N.N.E. of Florence.

MARRAT, a town of France, in the department of the Puy de Dome; nine miles S. of Thiers.

MARRIAGE, a civil and religious contract, whereby a man is joined and united to a woman, for the ends of procreation.

The essence of marriage consists in the mutual consent of the parties. Marriage is a part of the law of nations, and is in use among all people. The Romanists account it a sacrament.

The public use of marriage institutions consists, according to archdeacon Paley (Philos. vol. i.), in their promoting the following beneficial effects: 1. The private comfort of individuals: 2. The production of the greatest number of healthy children, their better education, and the making of due provision for their settlement in life: 3. The peace of human society, in cutting off a principal source of contention, by assigning one or more women to one man, and protecting his exclusive right by sanctions of morality and law: 4. The better government of society, by distributing the

community into separate families, and appointing over each the authority of a master of a family, which has more actual influence than all civil authority put together: 5. The additional security which the state receives for the good behaviour of its citizens, from the solicitude they feel for the welfare of their children, and from their being confined to permanent habitations: 6. The encouragement of industry.

The woman, with all her moveable goods, immediately upon marriage, passes wholly, *in potestatem viri*, into the power and disposal of her husband.

The first inhabitants of Greece lived together without marriage. Cecrops, king of Athens, is said to have been the first author of this honourable institution among that people. After the commonwealths of Greece were settled, marriage was very much encouraged by their laws, and the abtaining from it was discountenanced, and in many places punished. The Lacedæmonians were very remarkable for their severity towards those who deferred marriage beyond a limited time, as well as to those who wholly abstained from it. (See LACEDÆMONIANS.) The Athenians had an express law, that all commanders, orators, and persons entrusted with any public affair, should be married men. Polygamy was not commonly tolerated in Greece. The time of marriage was not the same in all places; the Spartans were not permitted to marry till they arrived at their full strength: the reason assigned for this custom by Lycurgus was, that the Spartan children might be strong and vigorous; and the Athenian laws are said to have once ordered, that men should not marry till thirty-five years of age. The season of the year which they preferred for this purpose was the winter, and particularly the month of January, called Gamelion. The Greeks thought it scandalous to contract marriage within certain degrees of consanguinity; whilst most of the barbarous nations allowed incestuous mixtures.

Most of the Grecian states, especially such as made any figure, required their citizens should match with none but citizens, and the children were not allowed to marry without the consent of their parents. The usual ceremonies in promising fidelity was kissing each other, or giving their right hands, which was a general form of ratifying all agreements. Before the marriage could be solemnized, the gods were to be consulted, and their assistance implored by prayers and sacrifices, which were offered to some of the deities that superintended these affairs, by the parents, or nearest relations of the persons to be married. When the victim was opened, the gall was taken out and thrown behind the altar, as being the seat of anger and malice, and therefore the aversion of all the deities who had the care of love, as well as those who became their votaries. For the particulars relating to the bride and bridegroom, see BRIDE and BRIDEGROOM.

The ceremonies of the Spartan marriages being different from all others, deserve to be mentioned at length, as related by Plutarch. "When the Spartans had a mind to marry, their courtship was a sort of rape upon the persons they had a fancy for; and those they chose not tender and half-children, but in the flower of their age, and full ripe for a husband. Matters being agreed between them, the *νυμφευτρια*, or woman that contrived and managed the plot, shaved off the bride's hair close to her skin, dressed her up in man's clothes, and left her upon a mattress: this done, the bridegroom entered in his common clothes, sober and composed, as having supped at his ordinary in the common hall, and stole as privately as he could into the room where the bride lay, untied her virgin girdle, whence *λευην ζωνην*, is to *desflower*, and took her into his embraces. Having stayed

a short

MARRIAGE.

a short time with her, he returned to his comrades, with whom he continued to spend his life, remaining with them as well by night as by day, unless when he stole a short visit to his bride; and that could not be done without a great deal of circumspection, and fear of being discovered. Nor was she wanting (as may be supposed) on her part, to use her wit in watching the most favourable opportunities for their meeting, and making appointments when company was out of the way. In this manner they lived a long time, inasmuch that they frequently had children by their wives before they saw their faces by day-light. The interview being thus difficult and rare, served not only for a continual exercise of their temperance, and farthered very much the ends and intentions of marriage, but was a means to keep their passion still alive, which flags and decays, and dies at last by too easy access, and long continuance with the beloved object." Potter, *Archæol.* book iv. c. xi. p. 295, seq.

The Romans, as well as the Greeks, disallowed of polygamy; and they encouraged marriage by the "jus trium liberorum." A man who had no child was entitled by the Roman law only to one-half of any legacy that should be left him, that is, at the most, could receive only one-half of the testator's fortune. A Roman might not marry any woman who was not a Roman. Among the Romans, the kalends, nones, and ides of every month, were deemed unlucky for the celebration of marriage, as was also the feast of the Parentalia, and the whole month of May. The most happy season in every respect was that which followed the ides of June.

The Roman laws speak of second marriages in very hard and odious terms: "Matre jam secundis nuptiis funestata, L. iii. C. de sec. nuptiis." By these laws it was enacted, that the effects of the husband or wife deceased should pass over to the children, if the survivor should marry a second time. By the law *Hac edita*, Cod. de sec. nupt. the survivor, upon marrying a second time, could not give the person he married a portion more than equal to that of each of the children. In the primitive church, the respect to chastity was carried so high, that a second marriage was accounted no other than a lawful whoredom, or a species of bigamy; and there are some ancient canons, which forbid the ecclesiastics from being present at second marriages.

Marriage, by the Mosaic law, was subject to several restrictions: thus by Levit. chap. xviii. ver. 16, a man was forbid to marry his brother's widow, unless he died without issue; in which case, it became enjoined as a duty. So he was forbid to marry his wife's sister, while she was living, ver. 18, which was not forbidden before the law, as appears from the instance of Jacob.

The ancient Roman law is silent on this head; and Papinian is the first who mentions it, on occasion of the marriage of Caracalla. The lawyers who came after him stretched the bonds of affinity so far, that they placed adoption on the same foot with nature.

Affinity, according to the modern canonists, renders marriage unlawful to the fourth generation, inclusive; but this is to be understood of direct affinity, and not of that which is secondary or collateral. "Affinis mei affinis, non est affinis meus." It is farther to be observed, that this impediment of marriage does not only follow an affinity contracted by lawful matrimony, but also that contracted by a criminal commerce; with this difference, that this last does not extend beyond the second generation; whereas the other, as has been observed, reaches to the fourth.

In Germany, they have a kind of marriage called *mor-*

ganatic, wherein a man of quality contracting with a woman of inferior rank, he gives her the left hand in lieu of the right; and stipulates in the contract, that the wife shall continue in her former rank or condition, and that the children born of them shall be of the same; so that they become bastards as to matters of inheritance, though they are legitimate in effect. They cannot bear the name or arms of the family.

None but princes, and great lords of Germany, are allowed this kind of marriage. The universities of Leipzig and Jena have declared against the validity of such contracts; maintaining, that they cannot prejudice the children, especially when the emperor's consent intervenes in the marriage.

The Turks have three kinds of marriages, and three sorts of wives; *legitimate*, *wives in kebin*, and *slaves*. They marry the first, hire the second, and buy the third. See **TURKEY**.

The people in Java marry and have children at nine or ten years old, and the women leave child-bearing before they are thirty; and at Tonquin there are women common to any that will hire them, at eight or nine years of age. See **JAVA** and **TONQUIN**.

Among the Hindoos polygamy is practised, but one wife is acknowledged as supreme. The ceremony of marriage is accompanied with many idolatrous forms. For an account of the singular mode of courtship and marriage ceremony in *New HOLLAND*, see that article.

In Russia, when a marriage is proposed, the lover, accompanied by a friend, goes to the house of the bride, and says to her mother, "Shew us your merchandize, we have got money;" referring, probably by this expression, to the ancient custom of buying a wife. The other ceremonies are equally curious. See **RUSSIA**.

Among the Persians, marriages are conducted by female mediation; and the pomp and ceremonies somewhat resemble the Russian. Polygamy is allowed, but the first married is the chief wife. See **PERSIA**.

In Siam, the espousals are concluded by female mediation. On the third visit the parties are considered as wedded, after the exchange of a few presents, and without any further ceremony, civil or sacred. Although polygamy is allowed, more from ostentation than from any other motive, one wife is always acknowledged as supreme. From pride the royal marriages are sometimes incestuous, and the king does not hesitate to espouse his own sister. (See **SIAM**.) The celebration of marriage in Sumatra is commonly performed in the balli or village-hall, and is accompanied with dances and songs. Polygamy is practised, seeming to be connected, as Mr. Marsden has observed, with the idea of purchasing a wife, instead of receiving a dowry with her. See **SUMATRA**.

For an account of the marriage ceremonies of Thibet, see **THIBET**.

Among all the savage nations, whether in Asia, Africa, or America, the wife is commonly bought by the husband from her father, or those other relations who have an authority over her; and the conclusion of a bargain for this purpose, together with the payment of the price, has, therefore, become the usual form or solemnity in the celebration of their marriages.

Among the Abiponians, the price varies from four horses down to a bottle of brandy. The Araucans may buy as many wives as they can afford to maintain. See **CHILI**.

Among the Chinese, the bride is purchased by a present to her parents, and is never seen by her husband till after the ceremony. In Circassia (which see), the bridegroom

MARRIAGE.

pays for his bride a marriage present, or "kalyin," consisting of arms or a coat of mail; but he must not see her, nor cohabit with her, without the greatest mystery. That reserve continues during life. The father makes the bride a present on the wedding-day, but reserves the greater part of what he intends to give her till the birth of her first child. On this occasion he pays her a visit, receives from him the remainder of her portion, and is clothed by him in the dress of a matron, of which the principal distinction is a veil.

The Hebrews also purchased their wives, by paying down a competent dowry for them: and Aristotle makes it one argument to prove that the ancient Grecians were an uncivilized people, because they used to buy their wives: and in proportion as they laid aside their barbarous manners, they left off this practice.

The ancient Assyrians sold their beauties by an annual auction. The prices were applied by way of portion to the more homely. By this contrivance, all of both sorts were disposed of in marriage. Among the old inhabitants of Germany, as well as the Jewish patriarchs, and the Grecians, the husband paid money to the family of the wife, whereas now the wife brings money to her husband. This alteration, says Paley, has proved of no small advantage to the female sex, for their importance in point of fortune procures for them, in modern times, that assiduity and respect which are always wanted to compensate for the inferiority of their strength, but which their personal attractions would not always secure.

The English law considers marriage in no other light than as a civil contract: the holiness of the matrimonial state being left entirely to the ecclesiastical law, to which it pertains to punish or annul incestuous or other unscriptural marriages. The law allows marriage to be good and valid, where the parties at the time of making it were willing and able to contract, and actually did contract, in the proper forms and solemnities required by law. As to their being willing to contract, "consensus, non concubitus, faciat nuptias," is the maxim of the civil law in this case; and it is adopted by the common lawyers. (Co. Litt. 33.) The disabilities or incapacities for contracting are of two sorts: first, such as are canonical, and, therefore, sufficient by the ecclesiastical laws to avoid the marriage in the spiritual court; such as pre-contract, consanguinity, or relation by blood; and affinity, or relation by marriage, and some particular corporeal infirmities. But these disabilities in our law do not make the marriage *ipso facto* void, but voidable only by sentence of separation; and marriages are esteemed valid to all civil purposes, unless such separation is actually made during the life of the parties. Thus, when a man had married his first wife's sister, and after her death the bishop's court was proceeding to annul the marriage, and bastardize the issue, the court of king's bench granted a prohibition *quoad hoc*; but permitted them to proceed to punish the husband for incest. Salk. 548.

By 32 Hen. VIII. c. 38. it is declared, that all persons may lawfully marry, but such as are prohibited by God's law, &c. And that nothing (God's law excepted) shall impeach any marriage but within the Levitical degrees: these are enumerated in the eighteenth chapter of Leviticus, and are illustrated by lord Coke in this manner: a man may not marry his mother, father's sister, mother's sister, sister, daughter, daughter of his son or daughter, father's wife, uncle's wife, father's wife's daughter, brother's wife, wife's sister, son's wife or wife's daughter, and daughter of his wife's son or daughter. And a woman may not marry her father, father's brother, mother's brother, brother, son of her son or daughter, mother's husband, aunt's husband,

sister's husband, husband's brother, and son of her husband's son or daughter. Accordingly, a table was set forth in the year 1563, specifying at large the prohibited degrees. It is observed, that the degrees prohibited by the Levitical law are all within the fourth degree of consanguinity, as established by the computation of the civilians; all collaterals, therefore, in that degree, or beyond it, may marry. By the civil law first cousins are allowed to marry; but by the canon law both first and second cousins are prohibited. Therefore, when it is vulgarly said, that first cousins may marry, but second cousins cannot, this probably arose by confounding these two laws; for first cousins may marry by the civil law, and second cousins cannot by the canon law. But by the foresaid stat. 32 Henry VIII. c. 38, it is clear that both first and second cousins may marry. By the same statute all impediments arising from pre-contracts to other persons were abolished, and declared of none effect, unless they had been consummated with bodily knowledge; in which case the canon law holds such contract to be a marriage *de facto*. But this branch of the statute was repealed by 2 and 3 Ed. VI. c. 23. How far the act of 26 Geo. II. c. 33. (which prohibits all suits in ecclesiastical courts to compel a marriage, in consequence of any contract) may collaterally extend to revive this clause of Henry VIII.'s statute, and abolish the impediment of pre-contract, judge Blackstone leaves to be considered by the canonists. We shall here observe, that on a promise of marriage, if it be mutual on both sides, damages may be recovered, in case either party refuses to marry; and though no time for the marriage is agreed on, if the plaintiff avers that he offered to marry the defendant, who refused it, an action is maintainable for the damages; but no action shall be brought upon any agreement except it is in writing, and signed by the party to be charged. The canonical hours for celebrating marriage are from eight till twelve in the forenoon.

Disabilities of another sort are those which are created, or at least enforced, by the municipal laws. These civil disabilities make the contract void *ab initio*, and not merely voidable, by rendering the parties incapable of forming any contract at all. The first legal disability is a prior marriage, or having another husband or wife living; in which case, besides the penalties consequent upon it as a felony, the second marriage is to all intents and purposes void. See BIGAMY, and POLYGAMY.

The next legal disability is want of age: therefore, if a boy under fourteen, or a girl under twelve years of age, marries, when either of them comes to the age of consent they may disagree, and declare the marriage void, without any divorce or sentence in the spiritual court. This is founded on the civil law: but the canon law pays a greater regard to the constitution than the age of the parties; for if they are "habiles ad matrimonium," it is a good marriage, whatever their age may be. And in our law it is so far a marriage, that, if at the age of consent they agree to continue together, they need not be married again. (Co. Litt. 79.) If the husband be of years of discretion, and the wife under twelve, when she comes to years of discretion he may disagree as well as she may; for in contracts the obligation must be mutual; both must be bound or neither: and so it is, *vice versa*, when the wife is of years of discretion, and the husband under. (Ibid.) However, in our law it is so far a marriage, that if at the age of consent they agree to continue together, they need not be married again. Another incapacity arises from want of consent of parents or guardians. By the common law, if the parties themselves were of the age of consent, no other concurrence was necessary to make the marriage valid; and this was agreeable to the canon law. But by several statutes

MARRIAGE.

statutes, viz. 6 and 7 W. III. c. 6. 7 and 8 W. III. c. 35. 10 Ann. c. 19. penalties of 100*l.* are laid on every clergyman who marries a couple, either without publication of banns, which may give notice to parents or guardians, or without a licence, to obtain which the consent of parents or guardians must be sworn to. And by 4 and 5 Ph. and M. c. 8. whosoever marries any woman-child under the age of sixteen years, without consent of parents or guardians, shall be subject to fine, or five years imprisonment; and her estate, during the husband's life, shall be enjoyed by the next heir. Thus also in France, under the old constitution, the sons cannot marry without consent of parents till thirty years of age, nor the daughters till twenty-five; and in Holland, the sons are at their own disposal at twenty-five, and the daughters at twenty. And by the marriage act, viz. 26 Geo. II. c. 33, it is enacted, that all marriages celebrated by licence (for banns suppose notice) where either of the parties is under twenty-one, not being a widow or widower, who are supposed emancipated, without the consent of the father, or, if he be not living, of the mother or guardians, shall be absolutely void. However, provision is made, where the mother or guardian is non compos, beyond sea, or unreasonably froward, to dispense with such consent, at the discretion of the lord chancellor; but no provision is made, in case the father should labour under any mental, or other incapacity. A fourth incapacity is want of reason. It is provided by 15 Geo. II. cap. 30. that the marriage of lunatics, and persons under phrenzies (if found lunatics under a commission, or committed to the care of trustees by any act of parliament) before they are declared of found mind by the lord chancellor, or the majority of such trustees, shall be totally void.

By the ancient law of England, if any Christian man did marry with a woman that was a Jew, or a Christian woman did marry with a Jew, it was felony, and the party so offending should be burnt alive (3 Inst. 89); or as the author of Fleta says, buried alive. But when both parties are Jews, they are allowed to marry; and are not under the restraints of the statute of 26 Geo. II. c. 33. By the civil law the woman is forbidden to marry again within the year of mourning, unless with a special dispensation from the prince; by reason of the uncertainty to which husband the issue may belong, and because a reverential mourning and pious regard to the memory of her deceased husband, are in decency expected. (Wood. Civ. L. 124. 2 Domat. 126.) And lord Coke says, for the avoiding of such like inconveniences, this was the law before the conquest; let every widow continue unmarried for twelve months; and if she shall marry, let her lose her dower. (1 Inst. 8.) But the divine and the canon law leaves no such injunctions. (Wood. Civ. L. 122.) Also, by the common law of England, a widow is not prohibited from marrying at any time after her husband's death. If a woman marry so soon after the death of her husband that the child may belong to either father, it is said the child may choose his father. Co. Litt. 8 a.

Lastly, the parties must not only be willing and able to contract, but must actually contract themselves in due form of law, to make it a good civil marriage. Any contract made, *per verba de presentii*, or in words of the present tense, and in case of cohabitation *per verba de futuro* also, between persons able to contract, was before the marriage act deemed a valid marriage to many purposes, and the parties might be compelled in the spiritual courts to celebrate it *in facie ecclesie*. But these verbal contracts are now of no force, to compel a future marriage. Nor is any marriage

at present valid that is not celebrated in some parish-church or public chapel, unless by dispensation from the archbishop of Canterbury. It must also be preceded by publication of banns, or by licence from the spiritual judge. No parson, vicar, &c. shall be obliged to publish banns of matrimony, unless the persons to be married shall, seven days before the time required for the first publication, deliver to him a notice in writing of their true names, and of the house or houses of their respective abode, within such parish, &c. and of the time that they have dwelt in such house or houses. And the said banns shall be published upon three Sundays preceding the solemnization of marriage, during the time of public service. In case the parents or guardians of either of the parties, who shall be under the age of twenty-one years, shall openly and publicly declare, or cause to be declared in the church or chapel, where the banns shall be so published, at the time of such publication, their dissent to such marriage, such publication of banns shall be void. And when the parties dwell in divers parishes, the curate of the one parish shall not solemnize matrimony betwixt them, without a certificate of the banns being thrice asked, from the curate of the other parish. In all cases where banns have been published, the marriage shall be solemnized in one of the parish churches or chapels where such banns have been published, and in no other place. A marriage in pursuance of a licence (except a special licence) must be solemnized in such church or chapel where the licence is granted; and no licence of marriage shall be granted by any archbishop, bishop, &c. to solemnize any marriage in any other church, &c. than in the parish church, &c. within which the usual place of abode of one of the parties shall have been for four weeks immediately before the granting such licence. By the same statute, all marriages shall be solemnized in the presence of two credible witnesses at the least, besides the minister, who shall sign their attestation thereof; and immediately after the celebration of every marriage, an entry thereof shall be made in the parish-register, expressing that the said marriage was celebrated by banns or licence; and if both or either of the parties be under age, with consent of the parents or guardians, as the case shall be, signed by the minister, and also by the parties married, and attested by the two witnesses present. It is held to be also essential to a marriage, that it be performed by a person in orders (Salk. 119.); though the intervention of a priest to solemnize this contract is merely *juris positivi*, and not *juris naturalis aut divini*; it being said that pope Innocent III. was the first who ordained the celebration of marriage in the church (Moor. 170.), before which it was totally a civil contract. And in the times of the grand rebellion, all marriages were performed by the justices of the peace; and these marriages were declared valid, without any fresh solemnization, by 12 Car. II. c. 33. But as the law now stands, we may upon the whole collect, that no marriage by the temporal law is *ipso facto* void, that is celebrated by a person in orders; in a parish-church, a public chapel, or elsewhere by special dispensation; in pursuance of banns or a licence; between single persons; consenting; of found mind; and of the age of twenty-one years; or of the age of fourteen in males, and twelve in females, with consent of parents or guardians, or without it in case of widowhood. And no marriage is voidable by the ecclesiastical law, after the death of either of the parties; nor during their lives, unless for the canonical impediments of precontract, if that indeed still exists; of consanguinity, and of affinity, or corporal imbecility, subsisting previous to the marriage. Blackst. Com. vol. i.

MARRIAGE.

By 26 Geo. II. c. 33. the substance of which has been already recited, if any person shall solemnize matrimony in any other place than a church, &c. where banns have been usually published, unless by a special licence, or without publication of banns, unless licence of marriage be first obtained from some person having authority to grant the same, every such person knowingly so offending, shall be guilty of felony, and transported for fourteen years; the prosecution to be within three years. By the same statute, to make a false entry into a marriage-register; to alter it when made; to forge or counterfeit such entry, or a marriage licence, or aid and abet such forgery, to utter the same as true, knowing it to be counterfeit; or to destroy or procure the destruction of any register, in order to vacate any marriage, or subject any person to the penalties of this act: all these offences, knowingly and wilfully committed, subject the party to the guilt of felony without benefit of clergy. But this act doth not extend to the marriages of the royal family; nor to Scotland; nor to any marriages among the people called Quakers, or among persons professing the Jewish religion, where both the parties are Quakers or Jews respectively; nor to any marriages beyond the seas.

As the passage into Scotland is left open by the marriage act, many persons have found their way thither to be married, in a clandestine and irregular manner; and there has been a diversity of opinions concerning the validity of such marriages. Lord Stair, in his "Institutions of the Laws of Scotland," says, the public solemnity of marriage is a matter of order, justly introduced by positive law, for the certainty of so important a contract; but not essential to marriage. Thence arises the distinction of public or solemn, and private or clandestine marriages. And though persons, who act contrary thereto, may be justly punished, (as in some nations by the exclusion of the issue of such marriages from succession,) yet the marriage cannot be declared void and annulled; and such exclusions seem very unequal against the innocent children. But by the custom of Scotland, cohabitation, and being commonly reputed man and wife, validate the marriage, give the wife a right to her thirds, who cannot be excluded therefrom, if she was reputed lawful wife, and not questioned during the husband's life, till the contrary be clearly proved. Mr. Erskine, in his "Principles of the Law of Scotland," says, it is not necessary that marriage be celebrated by a clergyman: the consent of parties may be declared before any magistrate, or simply before witnesses. When the order of the church is

observed, the marriage is called regular; when otherwise, clandestine. Towards a regular marriage, the church requires proclamation of banns in the churches, where the bride and bridegroom reside: formerly, not only bishops, but presbyteries, assumed a power of dispensing with proclamation of banns, on extraordinary occasions; but this hath not been exercised since the revolution. But whether clandestine marriages in Scotland, of English parties, who resort thither to evade the English law, shall be sustained in England, hath been doubted; and very learned men have questioned, notwithstanding such marriages are valid by the law of Scotland, whether they are effective in England. Where parties are bound, by the laws of their country, to execute any important act or contract with certain solemnities; it is doubted whether they can elude their own law, by going purposely to another country, where such solemnities are not essential, and then returning immediately, when the act is done. It is a question of public law; and the most celebrated writers on public law have holden, that such an act is fraudulent: it is *fraudem facere lege*, which the laws of all nations disallow. In a case that occurs in "Buller's Law of Nisi Prius," an appeal was made to the delegates: the appellant and respondent both English subjects, the appellant, being under age, ran away without the consent of her guardian, and were married in Scotland; and on a suit brought in the spiritual court to annul the marriage, it was holden that the marriage was good.

So, it has been since taken as an undoubted proposition, that a marriage celebrated in Scotland is such a marriage as would entitle the woman to dower in England.

By 35 Geo. III. c. 67. after reciting that the punishment of persons convicted of felony by virtue of 1 Jac. I. c. 11. "for restraining persons from marriage until their former wives or husbands be dead," has not proved effectual to deter wicked persons from being guilty of the said offence, it is enacted, that if any person being married, or who hereafter shall marry, do, after the 15th of May 1795, marry any person, the former husband or wife being alive, and shall be in due manner convicted thereof under the said act, shall be subject and liable to the same penalties, pains, and punishments, as by the laws now in force persons are liable to, who are convicted of grand or petit larceny.

For the proportions which marriages bear to births, and births to burials, in several parts of Europe, Mr. Derham gives us the following table:

Names of Places.	Marriages to Births, as	Births to Burials, as
England in general	1 to 4.63	1.12 to 1
London	1 to 4	1 to 1.1
Hantsire, from 1569 to 1658	1 to 4	1.2 to 1
Tiverton in Devonshire, from 1656 to 1664	1 to 3.7	1.26 to 1
Cranbrook in Kent, from 1560 to 1649	1 to 3.9	1.6 to 1
Aynho in Northamptonshire, for 118 years	1 to 6	1.6 to 1
Upminster in Essex, for 100 years	1 to 4.6	1.8 to 1
Frankfort on the Maine, in 1695	1 to 3.7	1.2 to 1
Old, Middle, and Lower Marck, in 1698	1 to 3.7	1.9 to 1
Dominions of the Elector of Brandenburg, in 1698	1 to 3.7	1.5 to 1
Breslaw in Silesia, from 1687 to 1691	1 to 3.7	1.6 to 1
Paris, in 1670, 1671, 1672	1 to 4.7	1.6 to 1

MARRIAGE.

The Editor has formed the following Table, similar to the preceding, from the observations collected and referred to by Dr. Price.

Names of Places.	Marriages to Births, as	Births to Burials, as
London, annual medium from 1716 to 1736 - - -	—	18000 to 26529, or 1 to 1.4, &c.
— from 1759 to 1768 - - -	—	15710 to 22956, or 1 to 1.4, &c.
Northampton, ditto, from 1741 to 1770 - - -	—	155 to 191, or 1 to 1.2, &c.
Norwich, ditto, from 1740 to 1769 - - -	—	{ 1057 christenings to 1206, or 1 to 1.1, &c.
Shrewsbury, ditto, from 1762 to 1768 - - -	—	301 to 329 or 1 to 1.09, &c.
Manchester and Salford, exclusive of Dissenters, ditto, } from 1755 to 1759 - - - - - }	—	756 to 743.
Ditto, ditto, including Dissenters, from 1768 to 1772 -	—	1098 to 958, or 1.14, &c. to 1.
Gainsborough in Lincolnshire, ditto, from 1752 to 1771	1 to 3.7	126 to 105, or 1.2 to 1.
Madeira, ditto, from 1759 to 1766 - - -	1 to 4.88	2201 to 1203, or 1.7 to 1.
Boston in New England, from 1731 to 1752 - - -	—	538 to 608, or 1 to 1.13, &c.
Christiana in Norway, in 1761 - - -	—	11024 to 6929, or 1.5 to 1.
Paris, mean of some of the best years, before 1772	1 to 4.3	19100 to 19400, or 1 to 1.01, &c.
Vienna, annual medium, from 1757 to 1769 - - -	—	5800 to 6600, or 1 to 1.1, &c.
Amsterdam, ditto, from 1761 to 1770 - - -	1 to 1.9, &c.	4600 to 7922 or 1 to 1.7, &c.
Copenhagen, ditto - - - - -	1 to 3.04, &c.	2700 to 3300, or 1 to 1.2, &c.
Stockholm, ditto, for nine years, ending in 1763	—	2535 to 3781.
Berlin, ditto, for five years, ending at 1759 - - -	1 to 3.9, &c.	3855 to 5054, or 1 to 1.3, &c.
Breslaw, ditto, from 1633 to 1734 - - -	—	1089 to 1256, or 1 to 1.15, &c.
—, ditto, from 1717 to 1725 - - -	—	1252 to 1507, or 1 to 1.2, &c.
Rome, ditto, from 1759 to 1761 - - -	—	5167 to 7153, or 1 to 1.3, &c.
Vaud, in Switzerland, ditto, for ten years before 1766	1 to 3.9	3155 to 2504, or 1.2, &c. to 1.
In all Sweden, for nine years to 1763 - - -	—	130 to 100.
In the kingdom of Naples, for five years to 1777 - - -	—	144 to 100.
In all France, for five years to 1774 - - -	—	117 to 100.
In Breslaw, Glogaw, and other towns of Silesia, for } four years to 1778 - - - - - }	10 to 45	996 to 1000.
In the country parishes and villages of Silesia, ditto	10 to 45	125 to 100.
In the kingdom of Prussia and dukedom of Lithuania, } ten years to 1702 - - - - - }	10 to 37	150 to 100.
— five years to 1716 - - - - -	10 to 39	180 to 100.
— five years to 1756 - - - - -	10 to 50	148 to 100.
In the Churmark of Brandenburg, five years to 1702 -	10 to 37	176 to 100.
—, four years to 1756 - - -	10 to 38	124 to 100.
In the duchy of Pomerania, six years to 1702 - - -	10 to 36	140 to 100.
—, six years to 1706 - - -	10 to 39	177 to 100.
—, six years to 1726 - - -	10 to 39	150 to 100.
—, four years to 1756 - - -	10 to 43	137 to 100.
In the Neumark of Brandenburg, five years to 1701 -	10 to 37	155 to 100.
—, five years to 1726 - - -	10 to 40	164 to 100.
—, five years to 1756 - - -	10 to 42	143 to 100.
In the dukedom of Magdeburg, five years to 1702 -	10 to 38	156 to 100.
—, five years to 1717 - - -	10 to 36	142 to 100.
—, five years to 1756 - - -	10 to 40	109 to 100.
In the duchy of Halberstadt, four years to 1692 - - -	10 to 39	160 to 100.
—, five years to 1746 - - -	10 to 38	136 to 100.
—, six years to 1756 - - -	10 to 37	111 to 100.
In the duchy of Ravensburg, five years to 1692 - - -	10 to 40	152 to 100.
—, four years to 1756 - - -	10 to 36	132 to 100.
In the dukedom of Cleve and county of Mark, four } years to 1701 - - - - - }	10 to 36	151 to 100.
— five years to 1739 - - - - -	10 to 42	134 to 100.
— four years to 1756 - - - - -	10 to 38	136 to 100.

MARRIAGE.

Names of Places.	Marriages to Births, as	Births to Burials, as
In the Austrian Milanese, 1769-1773-1774 - - -	10 to 45	110 to 100.
In Denmark, five years to 1747 - - -	—	121 to 100.
—, five years to 1756 - - -	—	112 to 100.
In Norway, five years to 1747 - - -	—	160 to 100.
—, fourteen years to 1756 - - -	—	136 to 100.
In 1056 country parishes and villages in the churmark of Brandenburg, consisting in 1748 of 106,204 males and 107,540 females, ten years to 1748 - - -	10 to 36	127 to 100.
In 7 market-towns and 54 country parishes in England, consisting in 1740 of 10,434 families and 46,650 inhabitants, in 1748 - - -	10 to 40	115 to 100.

For an account of the numbers of male and female still-born children and chryfoms, and of boys and girls under ten, of married men and married women, and of widows and widowers, who died for a course of years at Vienna, Breslaw, Dresden, Leipzig, Ratisbon, and some other towns in Germany, see Phil. Trans. Abr. vol. vii. part iv. p. 46, &c.

The reader may find many curious calculations and remarks relating to this subject in Dr. Price's excellent work, entitled "Observations on Reversionary Payments." From the preceding table it appears, that marriages, one with another, do each produce about four births, both in England, and other parts of Europe. Dr. Price observes, that the births at Paris, as may be seen in the table, are above four times the weddings; and therefore it may seem, that in the most healthy country situations, every wedding produces above four children; and though this be the case in Paris, for reasons which he has given, he has observed nothing like it in any other great town. He adds, that from comparing the births and weddings, in countries and towns where registers of them have been kept, it appears, that in the former, marriages, one with another, seldom produce less than four children each; generally between four and five, and sometimes above five: but in towns seldom above four, generally between three and four, and sometimes under three. It is necessary to be observed here, that though the proportion of annual births to weddings has been considered as giving the true number of children derived from each marriage, taking all marriages one with another; yet this is only true, when, for many years, the births and burials have kept nearly equal. Where there is an excess of the births occasioning an increase, the proportion of annual births to weddings must be less than the proportion of children derived from each marriage; and the contrary must take place, where there is a decrease; and by Mr. King's computation, about one in an hundred and four persons marry; the number of people in England being estimated at five millions and a half, whereof about forty-one thousand annually marry.

In the district of Vaud in Switzerland, the married are very nearly a third part of the inhabitants.

Major Graunt and Mr. King disagree in the proportions between males and females, the latter making ten males to thirteen females in London; in other cities and towns, and in the villages and hamlets, a hundred males to ninety-nine females; but major Graunt, both from the London and country bills, computes that there are in England fourteen males to thirteen females; whence he justly infers, that the Christian religion, prohibiting polygamy, is more agreeable

to the law of nature than Mahometanism, and others that allow it.

This proportion of males to females Mr. Derham thinks pretty just, being agreeable to what he had observed himself. In the hundred years, for instance, of his own parish-register of Upminster, though the burials of males and females were nearly equal, being six hundred and thirty-three males, and six hundred and twenty-three females, in all that time; yet there were baptized seven hundred and nine males, and but six hundred and seventy-five females, which is 13 females to 13.7 males. From a table formed by Dr. Price, he concludes that this proportion should have been stated at 19 to 20.

From a register kept at Northampton for twenty-eight years, from 1741 to 1770, it appears, that the proportion of males to females that were born in that period is 2361 to 2288, or nearly 13.4 to 13. However, though more males are born than females, Dr. Price has sufficiently shewn, that there is a considerable difference between the probabilities of life among males and females, in favour of the latter; so that males are more short-lived than females; and as the greater mortality of males takes place among children, as well as among males at all ages, the fact cannot be accounted for merely by their being more subject to untimely deaths by various accidents, and by their being addicted to the excesses and irregularities which shorten life. Mr. Kerseboom informs us, that, during the course of 125 years in Holland, females have, in all accidents of age, lived about three or four years longer than the same number of males. In several towns of Germany, &c. it appears, that of 7270 married persons who had died, the proportion of married men who died to the married women, was 3 to 2; and in Breslaw for eight years, as 5 to 3. In all Pomerania, during nine years, from 1748 to 1756, this proportion was nearly 15 to 11. Among the ministers and professors in Scotland, twenty married men die to twelve married women, at a medium of twenty-seven years, or in the proportion of 5 to 3; so that there is the chance of 3 to 2, and in some circumstances even, a greater chance, that the woman shall be the survivor of a marriage, and not a man; and this difference cannot be accounted for merely by the difference of age between men and their wives, without admitting the greater mortality of males. In the district of Vaud in Switzerland, it appears, that half the females do not die till the age of forty-six and upwards, though half the males die under thirty-six. It is likewise an indisputable fact, that, in the beginning of life, the rate of mortality among males is much greater than among females.

From

MARRIAGE.

From a table formed by Dr. Price, from a register kept for twenty years at Gainsborough, it appears, that of those who live to eighty, the major part, in the proportion of 49 to 32, are females. Mr. Deparcieux at Paris, and Mr. Wargentin in Sweden, have further observed, that not only women live longer than men, but that married women live longer than single women. From some registers examined by Mr. Muret in Switzerland, it appears, that of equal numbers of single and married women between fifteen and twenty-five, more of the former died than of the latter, in the proportion of 2 to 1. With respect to the difference between the mortality of males and females, it is found to be much less in country parishes and villages than in towns; and hence it is inferred, that human life in males is more brittle than in females, only in consequence of adventitious causes, or of some particular debility, that takes place in polished and luxurious societies, and especially in great towns.

From the inequality, above stated, between the males and females that are born, it is reasonable to infer, that one man ought to have but one wife; and yet that every woman, without polygamy, may have a husband; this surplussage of males above females being spent in the supplies of war, the seas, &c. from which the women are exempt. Perhaps, says Dr. Price, it might have been observed with more reason, that this provision had in view that particular weakness or delicacy in the constitution of males, which makes them more subject to mortality; and which consequently renders it necessary that more of them should be produced, in order to preserve in the world a due proportion between the two sexes. See EXPECTATION of life, and MORTALITY.

That this is a work of Providence, and not of chance, is well made out by the very laws of chance, by Dr. Arbuthnot; who supposes Thomas to lay against John, that for eighty-two years running, more males shall be born than females; and, giving all allowances in the computation to Thomas's side, he makes the odds against Thomas, that it does not so happen, to be near five millions of millions of millions to one; but for ages of ages, according to the world's age, to be near an infinite number to one.

According to Mr. Kerseboom's observations, there are about 325 children born from 100 marriages.

Mr. Kerseboom, from his observations, estimates the duration of marriages, one with another, as in the following table:

Those whose ages, taken together, make			
40	live together between	24	and 25 years.
50		22	23
60		23	21
70		19	20
80		17	18
90		14	15
100		12	13

Phil. Trans. N^o 468. sect. iii. p. 319.

Dr. Price has shewn, that on De Moivre's hypothesis, or that the probabilities of life decrease uniformly (see COMPLEMENT of life) the duration of survivorship is equal to the duration of marriage, when the ages are equal; or, in other words, that the expectation of two joint lives, the ages being equal, is the same with the expectation of survivorship; and, consequently, the number of survivors, or (which is the same, supposing no second marriages) of widows and widowers, alive together, which will arise from any given set of such marriages constantly kept up, will be equal to the whole number of marriages; or half of them (the number of widows in particular) equal to half the number of marriages. Thus, the expectation of two joint lives, both 40, is the third of 46 years, or their complement, *i. e.* 15 years

and 4 months; and this is also the expectation of the survivor. That is, supposing a set of marriages, between persons all 40, they will, one with another, last just this time, and the survivors will last the same time. In adding together the years which any great number of such marriages, and their survivorships, have lasted, the sums would be found to be equal. It is observed farther, that if the number expressing the expectation of single or joint lives, multiplied by the number of single or joint lives whose expectation it is, be added annually to a society or town, the sum gives the whole number living together, to which such an annual addition would in time grow: thus, since 19, or the third of 57, is the expectation of two joint lives, whose common age is 29; or common complement 57, twenty marriages every year between persons of this age would, in fifty-seven years, grow to 20 times 19, or 380 marriages always existing together. The number of survivors also arising from these marriages, and always living together, would, in twice 57 years, increase to the same number. Moreover, the particular proportion that becomes extinct every year, out of the whole number constantly existing together of single or joint lives, must, wherever this number undergoes no variation, be exactly the same with the expectation of those lives, at the time when their existence commenced. Thus, if it were found that a nineteenth part of all the marriages among any body of men, whose numbers do not vary, are dissolved every year by the deaths of either the husband or wife, it would appear, that 19 was, at the time they were contracted, the expectation of these marriages. Dr. Price observes, that the annual average of weddings among the ministers and professors in Scotland, for the last twenty-seven years, has been thirty-one; and the average of married persons, for seventeen years, ending in 1767, had been 667. This number, divided by 31, gives $21\frac{1}{2}$, the expectation of marriage among them; which, he says, is above $2\frac{1}{2}$ years more than the expectation of marriage would be, by Dr. Halley's table, on the supposition, that all first, second, and third marriages may be justly considered as commencing, one with another, so early as the age of thirty; and he has proved, that the expectation of two equal joint lives is to the expectation of a single life of the same age as 2 to 3: consequently, the expectation of a single life at 30, among the ministers in Scotland, cannot be less than 32.25. If we suppose the mean ages, of all who marry annually to be 33 and 25, the expectation of every marriage would be 19 years; or one with another they would be all extinct in 19 years; the marriages which continue beyond this term, though fewer in number, enjoying among them just as much more duration, as those that fall short of it enjoy less. But it appears from the observations and tables of Mr. Muret, that, in the district of Vaud (dividing half the number of married persons, *viz.* 38.328. by the annual medium of weddings, *viz.* 808) the expectation of marriage is only $23\frac{1}{2}$ years: so much higher are the probabilities of life in the country than in towns, or than they ought to be, according to De Moivre's hypothesis. Price's Obs. &c. See EXPECTATION of life, LIFE-annuities, and SURVIVORSHIP.

MARRIAGE, in *Chivalry*. See MARITAGIUM.

MARRIAGE, *Certificate of*. By 5 W. c. 21 and 38 Geo. III. c. 149: for every piece of vellum, parchment, or paper, upon which any certificate of marriage (except of the marriage of a seaman's widow) shall be ingrossed or written, shall be paid a stamp duty of 5s.; and writing such certificate upon the same before it be stamped incurs a forfeiture of 5l.

MARRIAGE, *Clandestine or Irregular*. See MARRIAGE, *supra*.

MARRIAGE,

MARRIAGE.

MARRIAGE, Contract of. See CONTRACT, and MARRIAGE, *supra*.

This contract formerly furnished one species of matrimonial causes, in which a party contracted to another brought a suit in the ecclesiastical court to compel a celebration of the marriage, in pursuance of such contract; but this branch of causes is now cut off entirely by the act for preventing clandestine marriages, 26 Geo. II. c. 33, which enacts that for the future no suit shall be had in any ecclesiastical court, to compel a celebration of marriage *in facie ecclesie*, for or because of any contract of matrimony whatsoever.

MARRIAGE, Dissolution of. See DIVORCE.

MARRIAGE, Duty of, is a term used in some ancient customs, signifying an obligation on women to marry.

To understand this, it must be observed, that old maids, and widows about sixty, who held fees in body, or were charged with any personal or military services, were anciently obliged to marry, to render those services to the lord by their husbands, or to indemnify the lord for what they could not do in person. And this was called *duty* or *service of marriage*.

MARRIAGE, Forcible. See FORCIBLE Marriage.

MARRIAGE, Frank. See FRANK.

MARRIAGE, Jactitation of, in Law, is one of the first and principal matrimonial causes, when one of the parties boasts or gives out, that he or she is married to the other, whereby a common reputation of their matrimony may ensue. On this ground the party injured may libel the other in the spiritual court; and unless the defendant undertakes and makes out a proof of the actual marriage, he or she is enjoined perpetual silence on that head; which is the only remedy the ecclesiastical courts can give for this injury. Blackitt. Com. vol. ii.

Dr. Godolphin says, that marriage was at first tried in the temporal courts; but afterwards, by the concession of princes, such causes were determined in the spiritual courts. The reasons why the cognizance thereof hath been permitted to the ecclesiastical judge are divers: especially because matrimony was heretofore a sacrament of the church; and the office being performed by clergymen, this of consequence brings the performance under the diocesan's inspection; and in the case of the Levitical degrees in particular, ecclesiastics are presumed to be the best judges of what is prohibited by God's law. The lawfulness of marriage is to be tried by the bishop's certificate (see CERTIFICATE), upon an issue "accoupled in lawful matrimony or not;" as in a writ of dower, appeal, bastardy, or the like. (1 Inst. 134.) And the bishop's certificate in this case is conclusive against all the world, and is the only mode of trying the issue on the plea of "ne unques accouple in loial matrimonie;" for to such a plea a mere sentence in the ecclesiastical court is not a good replication, because that would be to plead evidence, which, if it is any thing, amounts to the general issue, contrary to the rule (see 4 Bac. Abr. 60.), and to bind the court by what does not bind the bishop, who, if he see cause, may revoke the sentence. But such a sentence, unrepented and unappealed from, is evidence to a jury; and may be pleaded in chancery. Whether a woman is a feme covert, or whether she is the wife of such a person, is triable by a jury upon the above-mentioned issue. Therefore a marriage *de facto*, or in reputation (as amongst the Quakers) hath been allowed by the temporal courts to be sufficient for giving title to a personal estate, because the lawfulness of the marriage is not in issue, or the point to be tried. For the issue is whether a marriage was contracted between the parties or not, or whether the parties lived in a married state

where the legality of it doth not come in question. Wood. b. i. c. 6.

In the act of 6 and 7 W. c. 6. laying a duty upon marriages, Quakers and Jews, cohabiting as man and wife, were required to pay the said duty, although not married "according to the law of England;" and there was a proviso, that nothing therein contained should be construed to make good or effectual in law any such marriage or pretended marriage; but that they should be of the same force, and no other, as if the said act had not been made. But in the act of 26 Geo. II. c. 33. there is no proviso of the like purport; but rather the act proceeds upon a supposition that such marriages are good and valid.

In writs of dower, or other suits brought in the king's temporal courts, if issue be joined upon "not accoupled in lawful matrimony," this being a cause which is merely ecclesiastical, the trial thereof must be by the bishop or ordinary, upon an inquisition taken before him as judge.

The proof of a marriage may be by witnesses who were present at the solemnization; by cohabitation of the parties; by public fame and reputation; by confession of the married persons themselves, although their acknowledgment might only be to avoid the punishment of fornication; and by divers other circumstances; which, if they amount to half-proof, ought to be extended in favour of marriage rather than contrary to it. (Wood Civ. L. 122.) But now, since the 26 Geo. II. c. 33, the register-book seems to be intended as the proper, although not the only evidence in this matter; for if there shall be any doubt as to the identity of the persons, or the like, the register in this respect can be no evidence at all. However, the act does not take away the evidence of presumption from cohabitation; but if the evidence be clear that the marriage was not celebrated according to the requisitions of the act, it is totally void, and no declaratory sentence in the ecclesiastical court is necessary. But in some cases an actual marriage must be proved. See Burn's Eccl. Law. vol. ii. art. MARRIAGE.

MARRIAGE, Proof of. See the preceding article.

MARRIAGE, Property by, is a property in goods and chattels acquired by marriage; whereby those chattels, which belonged formerly to the wife, are by act of law vested in the husband, with the same degree of property, and with the same powers, as the wife, when sole, had over them. This depends entirely on the notion of an unity of person between the husband and wife; it being held that they are one person in law; so that the very being and existence of the woman is suspended during the coverture, or entirely merged or incorporated in that of the husband. (See COVERTURE.) Hence it follows, that whatever personal property belonged to the wife before marriage, is, by marriage, absolutely vested in the husband. In a real estate, he only gains a title to the writs and profits during coverture; for that, depending upon feudal principles, remains entire to the wife, after the death of her husband, or to her heirs, if she dies before him; unless, by the birth of a child, he becomes tenant for life by the curtesy. But, in chattel interests, the sole and absolute property vests in the husband, to be disposed of at his pleasure, if he chuses to take possession of them; for unless he reduces them to possession, by exercising some act of ownership upon them, no property vests in him, but they shall remain to the wife, or her representatives, after the coverture is determined.

There is therefore a very considerable difference in the acquisition of this species of property by the husband, according to the subject matter; *viz.* whether it be a chattel *real*, or a chattel *personal*; and, of chattels personal, whether it be in *possession*, or in *action* only. A chattel *real* vests in the husband,

MARRIAGE.

husband, not absolutely, but *sub modo*. As, in case of a lease for years, the husband shall receive all the rents and profits of it, and may, if he pleases, sell, surrender, or dispose of it during the coverture (Co. Litt. 46.): if he be outlawed or attainted, it shall be forfeited to the king (Plowd. 263.); it is liable to execution for his debts (Co. Litt. 351.): and, if he survives his wife, it is to all intents and purposes his own. (Co. Litt. 300.) Yet, if he has made no disposition thereof in his life-time, and dies before his wife, he cannot dispose of it by will (Poph. 5. Co. Litt. 351.): for, the husband having made no alteration in the property during his life, it never was transferred from the wife; but after his death she shall remain in her ancient possession, and it shall not go to his executors. So it is also of chattels personal (or *choses*) in *action*; as debts upon bond, contracts, and the like: these the husband may have if he pleases; that is, if he reduces them into possession by receiving or recovering them at law. And, upon such receipt or recovery, they are absolutely and entirely his own; and shall go to his executors or administrators, or as he shall bequeath them by will, and shall not revert in the wife. But, if he dies before he has recovered or reduced them into possession, so that at his death they still continue *choses in action*, they shall survive to the wife; for the husband never exerted the power he had of obtaining an exclusive property in them. (Co. Litt. 351.) And so, if an estray comes into the wife's franchise, and the husband seizes it, it is absolutely his property: but, if he dies without seizing it, his executors are not now at liberty to seize it, but the wife or her heirs (Co. Litt. 351.); for the husband never exerted the right he had, which right determined with the coverture. Thus in both these species of property the law is the same, in case the wife survives the husband; but, in case the husband survives the wife, the law is very different with respect to *chattels real* and *choses in action*: for he shall have the *chattel real* by survivorship, but not the *chose in action* (3 Mod. 186.); except in the case of arrears of rent, due to the wife before her coverture, which, in case of her death, are given to the husband by statute 32 Hen. VIII. c. 37. And the reason for the general law is this: that the husband is in absolute possession of the *chattel real* during the coverture, by a kind of joint-tenancy with his wife; wherefore the law will not wrest it out of his hands, and give it to her representatives; though, in case he had died first, it would have survived to the wife, unless he thought proper in his life-time to alter the possession. But a *chose in action* shall not survive to him, because he never was in possession of it at all, during the coverture; and the only method he had to gain possession of it, was by suing in his wife's right: but as, after her death, he cannot (as husband) bring an action in her right, because they are no longer one and the same person in law, therefore he can never (as such) recover the possession. But he still will be entitled to be her administrator; and may, in that capacity, recover such things in action as became due to her before or during the coverture.

Thus, and upon these reasons, stands the law between husband and wife, with regard to *chattels real* and *choses in action*: but as to *chattels personal* (or *choses*) in *possession*, which the wife hath in her own right, as ready money, jewels, household goods, and the like, the husband hath therein an immediate and absolute property, devolved to him by the marriage, not only potentially but in fact, which never can again revert in the wife or her representatives. Co. Litt. 351.

And, as the husband may thus generally acquire a property in all the personal substance of the wife, so in one particular instance the wife may acquire a property in some

of her husband's goods; which shall remain to her after his death, and not go to his executors. These are called her *paraphernalia*; which see. Blackst. Com. b. ii.

MARRIAGE of the Royal Family is excepted from the act 26 Geo. II. c. 33. (See MARRIAGE.) But by the 12 Geo. III. c. 11. no descendant of his late majesty Geo. II. (other than the issue of princesses married or who may marry into foreign families) shall be capable of contracting matrimony, without the previous consent of his majesty, his heirs, &c. signified under the great seal, declared in council, and entered in the privy-council books: and every marriage of any such descendant, without such consent, shall be null and void. But in case any descendant of Geo. II., being above 25 years old, shall persist to contract a marriage disapproved of by his majesty, such descendant, after giving 12 months notice to the privy council, may contract such marriage, and the same may be duly solemnized, without the previous consent of his majesty. And such marriage shall be good except both houses of parliament shall, before the expiration of the said 12 months, declare their disapprobation of such intended marriage. And persons who shall wilfully solemnize, or assist at the celebration of such prohibited marriage, shall, on conviction, incur the penalties of the statute of *præmunire*, 16 R. II.

MARRIAGE Settlement, is a legal act, previous to marriage, whereby a jointure is secured to the wife after the death of the husband. (See JOINTURE.) These settlements seem to have been in use among the ancient Germans, and their kindred nation the Gauls. Of the former Tacitus gives us this account: "Dotem non uxor marito, sed uxori maritus. affert: intersunt parentes et propinqui, et munera probant." De Mor. Germ. c. 18. And Cæsar, De Bell. Gallic. lib. vi. c. 18. has given us the terms of a marriage settlement among the Gauls, as nicely calculated as any modern jointure. "Viri, quantas pecunias ab uxoribus dotis nomine acceperunt, tantas ex suis bonis, æstimatione facta, cum dotibus communicant. Hujus omnis pecuniæ conjunctim ratio habetur, fructusque servantur. Uter eorum vita superavit, ad eum pars utriusque cum fructibus superiorum temporum pervenit." The dauphin's commentator supposes that this Gaulish custom was the ground of the new regulations made by Justinian, Nov. 97. with regard to the provision for widows among the Romans; but surely there is as much reason to suppose, says judge Blackstone, that it gave the hint for our statutable jointures. Comm. vol. ii. p. 138.

See an excellent marriage settlement by Blackstone, in the Appendix to the second volume of his Commentaries.

MARRIAGE, in *Socage-tenure*, or *valor maritaggi*, was not any perquisite or advantage to the guardian, but rather the reverse. For, if the guardian married his ward under the age of 14, he was bound to account to the ward for the value of the marriage, even though he took nothing for it, unless he married him to advantage. (Litt. § 123.) For the law, in favour of infants, is always jealous of guardians, and therefore in this case it made them account, not only for what they *did*, but also what they *might*, receive on the infant's behalf; but by some collusion the guardian should have received the value, and not brought it to account; but the statute (12 Car. II. c. 24.) having destroyed all values of marriages, this doctrine of *courle* has ceased with them. At 14 years of age the ward might have disposed of himself in marriage, without any consent of his guardian, till the act (26 Geo. II. c. 33.) for preventing clandestine marriages. These doctrines of wardship and marriage in *socage-tenure* were so diametrically opposite to those in *knight-service*, and so entirely agree with those

parts of king Edward's laws, that were restored by the charter of Henry I., as might alone convince us that fofage was of a higher original than the Norman conquest. See GUARDIAN, SOCAGE, and WARDSHIP.

MARRIAGE Vow denotes the mutual promise made to one another by the husband and wife at the time of the solemnization of marriage. The husband promises on his part "to love, comfort, honour, and keep his wife;" the wife on her's "to obey, serve, love, honour, and keep her husband;" in every variety of health, fortune, and condition; and both stipulate "to forsake all others, and to keep only to one another, so long as they both shall live." This promise is witnessed before God and the congregation; accompanied with prayers to Almighty God for his blessing upon it; and attended, according to the form established in this country, with such circumstances of devotion and solemnity as place the obligation of it, and the guilt of violating it, nearly upon the same foundation with that of oaths. The Christian Scriptures enjoin upon the wife, that obedience which she here promises, and in terms so peremptory and absolute, that it seems to extend to every thing not criminal, or not entirely inconsistent with the woman's happiness. "Let the wife," says St. Paul, "be subject to her own husband in every thing." "The ornament of a meek and quiet spirit (says the same apostle, speaking of the duty of wives) is in the sight of God of great price." No words ever expressed the true merit of the female character so well as these. The man who does not duly regard the end of the institution, and who is conscious at the time of his marriage, of such a dislike to the woman he is about to marry, or of such a subsisting attachment to some other woman, that he cannot reasonably ever hope to entertain an affection for his future wife, is guilty, when he pronounces the marriage vow, of a direct and deliberate prevarication; aggravated by those ideas of religion and of the supreme being, which the place, the ritual, and the solemnity of the occasion cannot fail of suggesting. The same is true likewise with respect to the woman. The charge, says Paley, must be imputed to all, who, from mercenary motives, marry the objects of their aversion and disgust; and likewise to those who desert, from any motive whatever, the object of their affection, and, without being able to subdue that affection, marry another. The crime of falsehood is also incurred by the man who intends, at the time of his marriage, to commence, renew, or continue a personal amour with any other woman; and if a wife be capable of so much guilt, the parity of reason extends to her. The marriage vow is violated by adultery, and also by any behaviour which, knowingly, renders the life of the other miserable; as desertion, neglect, prodigality, drunkenness, peevishness, penuriousness, jealousy, or any levity of conduct, which administers occasion of jealousy. Paley's Principles of Mor. and Pol. Philos. vol. i.

MARRIAGE, Maritagium, in Law, signifies not only the lawful joining of man and wife, but also the right of bestowing a ward, or widow, in marriage; as well as the land given in marriage. See MARITAGIUM.

MARRICA, CAPE, in Geography, a cape on the S.E. coast of Arabia. N. lat. 18° 30'. E. long. 56° 25'.

MARRIONA, a bay of the island of Antigua; two miles S. of Willoughby bay.

MARRO, a river of Naples, which runs into the sea; eight miles S. of Nicotera.

MARROQUIN, vulgarly *Morocco leather*. See MOROCCO.

MARROSSE, in *Geography*, an island in the East Indian sea, near Antongil bay, in the island of Madagascar. This

island affords plenty of lemons and pine apples, with an ample supply of fruit, fowls, and fresh meat.

MARROW, a soft oleaginous substance contained in the cavities of the bones. See BONE and MEDULLA.

MARROW, Spinal. See MEDULLA SPINALIS.

MARROWS, in Agriculture, a provincial word used to signify fellows in speaking of cattle, as oxen, &c.

MARRUBIASTRUM, in *Botany*. See BALLOTA, LEONURUS, and STACHYS.

MARRUBIUM is supposed to have been so called by the ancients from its having been originally found in the neighbourhood of *Marrubium*, a town of the Marfyans in Italy, eastward of the lake Fucinus. Ambrosinus records various other conjectures as to the origin of this name. Some authors having supposed it derived from *mare*, the sea, because a native of maritime situations; some have thought it was named from its bitter properties; *amarus*, bitter; and others have imagined its name to have been suggested by the withered appearance of its leaves, which seem as if they were corroded with rust, *rubigo*.—These ideas afford rather a presumption that nothing is really known about the matter.—Horehound. Linn. Gen. 294. Schreb. 391. Willd. Sp. Pl. v. 3. 109. Mart. Mill. Dict. v. 3. Sm. Fl. Brit. 636. Ait. Hort. Kew. ed. 2. v. 3. 402. Tournef. t. 91. Juss. 114. Lamarck Illustr. t. 508. (*Pseudodictamnus*; Tournef. t. 89) Class and order, *Didymia Gymnospermia*. Nat. Ord. *Verticillata*, Linn. *Labiata*, Tournef. and Juss.

Gen. Ch. *Cal.* Perianth inferior, of one leaf, salver-shaped, rigid, ten-freaked; its mouth equal, spreading, mostly ten-toothed; the teeth alternately smaller. *Cor.* of one petal, ringent; tube cylindrical; limb gaping; throat long, tubular: upper lip erect, linear, cloven, acute, lower lip reflexed, broader, cloven half way down into three segments, of which the middle one is broader and emarginate, the others acute. *Stam.* Filaments four, shorter than the corolla, concealed under the upper lip, two of them longer; anthers simple. *Pist.* Germen superior, four-cleft; style thread-shaped, in length and position like the stamens; stigma cloven. *Peric.* none, except the calyx, which is contracted at the neck, expanded at the mouth, including the seeds. *Seeds* four, rather oblong.

Ess. Ch. Calyx salver-shaped, rigid, with ten furrows. Upper lip of the corolla cloven, linear, straight.

Obs. The following variations in the generic character of *Marrubium* are noticed by Linnæus and Schreber; these authors observe that the *Marrubium* of Tournefort and *Pseudodictamnus* of the same author differ from each other in this respect, the former having the upper lip of its corolla erect, and the latter vaulted. Some species of this genus have only five calyx-teeth. *M. crispum* has an entire upper lip, whilst *M. hispanicum* has the upper lip of its corolla three or four-cleft.

A very natural division of *Marrubium* into two sections is afforded from the number of calyx-teeth being either five or ten. Linnæus described eleven species in the fourteenth edition of his *Systema Vegetabilium*, and Willdenow has added three more; namely, *M. creticum*, which Linnæus considered a variety of *peregrinum*, *M. catarisfolium*, and *hirsutum*. There is also a beautiful new species in the *Flora Græca* called *velutinum*.

Seeds. 1. Calyx with five teeth.

1. *M. Alyssum*. Galen's Madwort. Plaited-leaved White-Horehound. Linn. Sp. Pl. 815. (*Alyssum Galeni*; Ger. em. 465.)—Leaves wedge-shaped, five-toothed, plaited. Whorls without an involucre—Native of Spain and Italy, flowering in July and August.—*Root* perennial. *Stem* branched,

MARRUBIUM.

branched, rigid. *Leaves* opposite; hoary, bluntly toothed. *Flowers* purple, in small, loose whorls. The segments of the calyx spreading, and ending in very stiff prickles.—Linnaeus says that there are three small purple flowers on each side, and that the calyx is acute, with spreading teeth. Willdenow quotes *M. plicatum* of Forskhal as a synonym of *M. Alyssum*, and Vahl says it scarcely differs from it, except that the former has ten-flowered whorls, (which is sometimes the case with the latter) the herbage is white with wool, and the leaves less wedge-shaped and rounder.

2. *M. astracanicum*. Astracan White-Horehound. Linn. Syst. Veg. ed. 14. 537. Jacq. Ic. Rar. v. 1. t. 109.—Leaves ovate, crenate, downy, very rugose. Calyx-teeth awl-shaped. Upper segments of the corolla lanceolate and acute. Found at Astracan and in the East.—It flowers in May.—*Primary stems* perennial, numerous, half a foot in length, branched and decumbent; from these spring other *stems* annually, which are herbaceous, erect, a foot high, woolly and hoary. *Leaves* on stalks, wrinkled on both sides, soft and bitter, the younger ones extremely woolly. *Flowers* sessile, in whorls, of a beautiful blue colour.

3. *M. peregrinum*. Sicilian White-Horehound. Linn. Sp. Pl. 815. Jacq. Austr. v. 2. t. 160.—Leaves ovate-lanceolate, serrated. Calyx-teeth bristle-shaped.—A native of Sicily, Germany, and the Levant, flowering through the summer.—*Root* perennial, woody, branched. *Stems* near two feet high, erect or ascending, quadrangular, woolly below. *Leaves* opposite, on stalks, acute, veined, serrated, some of the upper ones entire. *Flowers* white, rather villose. *Seeds* black, furnished with white hairs. The plant has not much smell, but a bitter and somewhat acrid taste. It is called Σάβορα by the modern Greeks.

4. *M. Creticum*. Cretan White-Horehound. Willd. n. 4. Sm. Prod. Fl. Græc. p. 2. 412. Dalech. Hist. 962.—Leaves lanceolate, whitish, rugosely veined, toothed at the top. Calyx-leaves bristle-shaped. Stem branched, divaricated.—A native of the Levant, flowering from July to September.—Linnaeus considered this species merely as a variety of the last, calling it *peregrinum* β, and professor Martyn has done the same.—We are however inclined to follow Dr. Smith in considering it as a distinct species. *Stems* slender, hoary, near three feet high. *Leaves* very hoary, much longer and narrower than those of the preceding; the *whorls of flowers* are smaller; and the bristly indentures of the calyx longer and erect. The whole plant has an agreeable flavour.

5. *M. candidissimum*. Woolly White-Horehound. Linn. Sp. Pl. 816. (*M. folio rotundo candidissimo*; Dill. Elth. 218. t. 174. f. 214.)—Leaves ovate, obtuse, toothed, rugosely veined. Calyx-teeth awl-shaped. Stem somewhat branched at the base.—A native of the Levant, flowering from June to September.—*Stems* from twelve to eighteen inches in length, procumbent below, obtusely square, and villose. *Leaves* thick, pale-green, and hoary. *Flowers* terminal, white, in close whorls.

6. *M. supinum*. Procumbent White-Horehound. Linn. Sp. Pl. 816. (*M. album, sericeo parvo et rotundo folio*; Boccon. Mus. 78. t. 96.)—Leaves roundish, rather heart-shaped, notched. Calyx-teeth bristly, straight, woolly.—A native of Spain and the south of France. It flowers from August to October.—*Stems* about eight or nine inches long, covered with a soft hoary down. *Leaves* small, roundish, very soft, and hoary. *Flowers* white, in small downy whorls.

7. *M. catariefolium*. Cat-Mint White-Horehound. Willd. Sp. Pl. v. 3. 110. Lamarck Dict. v. 3. 771. (*M. orientale catarie folio flore albo*; Tourn. Cor. 12.)—Leaves

ovate, deeply notched. Calyx-teeth awl-shaped, smooth, spreading.—A native of the East. *Stem* branched, erect, one or two feet high, square, rather downy. *Leaves* much resembling those of *Nepeta Cataria*, opposite, on stalks, green above, paler beneath. *Flowers* white, many in a whorl.

8. *M. velutinum*. Velvet-White-Horehound. Sm. Prod. Fl. Græc. p. 2. 412. Fl. Græc. t. 561.—Leaves roundish, retuse, silky, rugose, crenate. Calyx-teeth spreading. Stem branched. Found by Dr. Sibthorp on Mount Parnassus.—The habit of this new species is very similar to that of *M. vulgare*, next to be described. *Stems* about two feet high, woolly, erect, and straight. *Leaves* opposite, on short stalks. *Flowers* very numerous, in close whorls, their tube whitish; upper lip pale; lower of a tawny yellow, bordered with brown.

Sett. 2. Calyx with ten teeth.

9. *M. vulgare*. White-Horehound. Linn. Sp. Pl. 816. Engl. Bot. t. 410. Woodv. Med. Bot. t. 97.—Teeth of the calyx ten, bristle-shaped, hooked.—Common in various parts of England, on waste ground, and among rubbish, in hot, dry, dusty situations; flowering late in the summer.—*Root* perennial and woody. *Stems* a foot and half high, covered with thick wool. *Leaves* opposite, on footstalks, rounded, notched, rugose, whitish, very woolly on the lower side. *Flowers* white, in numerous, sessile whorls, which are extremely hairy. *Braçteas* bristle-shaped, bearded, hooked. The whole herb is aromatic and bitter.

10. *M. africanum*. African White-Horehound. Linn. Sp. Pl. 816. (*Pseudo-Dictamnus africanus, foliis subrotundis subtus incanis*; Commel. Hort. v. 2. 179. t. 90.)—Leaves heart-shaped, roundish, deeply crenate.—A native of the Cape of Good Hope, flowering from July to September.—*Root* perennial. *Stem* two feet high, upright, branched, rather downy, grooved. *Leaves* wrinkled, downy. *Flowers* whorled, white, shorter than the calyx; whorls remote.

11. *M. crispum*. Curl-leaved White-Horehound. Linn. Sp. Pl. 1674. (*Marrubium dictamni spurii foliis et facie*; Herm. Parad. t. 200.)—Leaves heart-shaped, roundish, notched, or rather toothed. Calyx-teeth beardless.—Native of the south of Europe, Italy, Sicily, and Spain, flowering through the summer.—*Stem* rather shrubby, upright, rough with hairs. *Leaves* on stalks, much wrinkled, downy, hairy beneath. *Corolla* purplish, not hairy.—Willdenow observes that *M. crispum* does not exactly agree with the synonym of Hermann, his plant having the upper lip of its corolla lanceolate and bearded, as well as its stamens of an equal length with the lip.—The last species (*M. africanum*) differs from the present by the helmet or upper lip of its corolla being emarginate and hairy.

12. *M. hirsutum*. Hairy White-Horehound. Willd. n. 11.—Leaves heart-shaped, ovate, notched. Teeth of the calyx spreading and lanceolate. *Braçteas* awl-shaped.—We know nothing of this species but from Willdenow, who has seen a living specimen, and says that it is very closely allied to the following in foliage and habit, but different as to the *calyx* and *bracteas*.

13. *M. hispanicum*. Spanish White-Horehound. (Linn. Sp. Pl. 816. *M. album rotundifolium hispanicum*; Herm. Parad. t. 201.)—Leaves heart-shaped, notched, ovate. Border of the calyx spreading; teeth ovate, pointed. *Braçteas* oblong.—A native of Spain, where it flowers in the summer.—*Stems* erect, downy. *Leaves* wrinkled and downy, more round and serrated than in *M. vulgare*. The whole plant is extremely hoary. Linnaeus remarks that the *leaves* are roundish, flat, and crenate; the upper lip of the

corolla trifold or quadrifid; the teeth of the *calyx* alternately larger and smaller.

14. *M. Pseudo-Dictamnus*. Shrubby White Horehound. Linn. Sp. 817. (*Pseudo-Dictamnus*; Dod. Pempt. 281.)—*Calyx*-border flat and hairy. Leaves heart-shaped, concave. Stem shrubby.—A native of the island of Candia. Found also by Dr. Sibthorp in other islands of the Archipelago.—It flowers from June to August.—*Stem* two or three feet high, divided into many branches. *Leaves* small, growing very close to the stalks. *Flowers* whorled, of a white colour; whorls resembling those of *M. crispum*, but not so large. The whole plant very hoary, covered with a sort of dense compact cottony substance.—This species is the $\Psi\upsilon\delta\delta\iota\kappa\alpha\mu\upsilon\varsigma$ of Dioscorides, and is called in English the false Dittany of Crete, from its general resemblance to *Origanum Dictamnus*.

15. *M. acetabulosum*. Saucer-like White Horehound. Linn. Sp. Pl. 817. (*Dictamnus falsus verticillatus*, pericarpio conoide, bæticus; Barrel. It. t. 129.)—*Calyx*-border longer than the tube, membranaceous, the greater angles rounded.—A native of Crete, introduced by sir George Wheeler into this country in 1676. Its time of flowering exactly coincides with the last.—*Stems* about two feet high, hairy. *Leaves* heart-shaped, serrated, rough on their upper side, downy beneath. *Flowers* small, of a pale purple, in large whorls.—Dr. Sibthorp found this species in Crete, but not in any other of the Grecian islands. It was known to Dioscorides, who called it $\text{Ἐπερος ἀπὸ Κρήνης δίκταμνος}$.

The genus now described is composed of many curious and interesting species to the botanist, though only a few of them find a place in our gardens. Those which are cultivated as shrubs, especially the two last, from the hoariness of their foliage, make a pretty variety when intermixed with other plants.—*M. velutinum*, which is one day to appear in the *Flora Græca*, is entirely new, and we have adopted it from the Prodomus to that work.

MARRUBIUM, in *Gardening*, comprises plants of the shrubby kind, of which the species cultivated are, the shrubby white horehound (*M. Pseudo-Dictamnus*); and the saucer-leaved white horehound (*M. acetabulosum*).

Method of Culture.—These sorts of plants are capable of being increased by planting cuttings of the young shoots or branches in a shady border in the early spring, as about April. When the plants are well rooted, they may be removed into the places where they are to grow: when they grow strongly, they should be screened from hard frosts in winter.

They continue the longest in poor dry soils, from their having a less luxuriant growth in such cases.

These plants afford variety in the borders, clumps, &c. of pleasure-grounds, and other situations.

MARRUBIUM, in *Ancient Geography*, a town of Italy, and capital of the Marfi; seated on the E. bank of the lake Fucinus. The inhabitants of this town, as well as the Marfi, in general, were famous for disregarding and healing the bites of serpents, and for being excellent swimmers. Its ruins at St. Benedetto, present to the investigation of the curious an arena, and traces of the circuit of a spacious amphitheatre.

MARRUBIUM, in the *Materia Medica*. See HOREHOUND.

MARRUCINI, in *Ancient Geography*, a people of Italy, in the Adriatic gulf, between the Veltini and the Frentani. Their country was watered by the Aternus. In their origin they were Sabines. Their principal town was Teate, seated on a mountain.

MARS, in *Astronomy*, one of the primary planets in our solar system; its orbit is situated between those of the Earth

and Jupiter. It evidently owes its name to its fiery appearance, which is supposed, with much probability, to be derived from its own atmosphere, the existence of which is indicated with more certainty than in any other planet.

Besides the ruddy colour of Mars, we have another argument of his being encompassed with an atmosphere; and it is this: that, when any of the fixed stars are seen near his body, they appear extremely obscured, and almost extinct. If this be the case, an eye placed in Mars would scarcely ever see Mercury, unless, perhaps, in the sun at the time of conjunction, when Mercury passes over his disk, as he sometimes appears to us, in form of a spot. A spectator in Mars will see Venus about the same distance from the sun as Mercury appears to us; and the Earth as big as Venus appears to us, and never above 48 degrees from the sun: and when the Earth is found in conjunction with, and very near the sun, he will see the Earth appear horned, or falcated, and its attendant the moon of the same figure, and, at its utmost distance from the Earth, not above 15 minutes of a degree, though they are really two hundred and forty thousand miles asunder. This planet being but a fifth part so big as the Earth, if any moon attends him, she must be very small, and has not yet been discovered by our best telescopes.

The telescopic appearance of Mars is very variable; but the predominant brightness of the polar regions leads to the supposition that its poles, like those of the Earth, are covered with perpetual snow; and Dr. Herschel imagines that the changes in brightness are connected with the summer and winter seasons on that planet. In the year 1784, he published in the Philosophical Transactions, vol. lxxiv., an account of a very laborious investigation of all the circumstances relating to the telescopic phenomena of this planet, and concludes by giving the following result:

1. The axis of Mars is inclined to the ecliptic $59^{\circ} 42'$.
2. The node of its axis is in $17^{\circ} 47'$ of Pices.
3. The obliquity of the ecliptic on the globe of Mars is $28^{\circ} 42'$.
4. The point Aries of the ecliptic of Mars answers to our $19^{\circ} 28'$ of Sagittarius.
5. The figure of Mars is that of an oblate spheroid, whose equatorial diameter is to the polar one as 1355 to 1272, or as 16 to 15 nearly.
6. The equatorial diameter of Mars reduced to the mean distance of the earth from the sun, is $9'' 8''$.
7. This planet has a considerable, but moderate atmosphere, so that its inhabitants probably enjoy a situation in many respects similar to ours.

Dr. Hook, in 1665, observed several spots in Mars; which, having a motion, he concluded the planet to turn round its centre. In 1666, M. Cassini observed several spots in the two faces or hemispheres of Mars, which, by continuing his different observations very diligently, he found to move by little and little from east to west, and to return, in the space of 24 hours 40 minutes, to their former situation. These observations were repeated in 1670, and confirmed by Maraldi, 1704 and 1719. Whence both the motion and period, or natural day, of that planet, were determined.

Plate XVII. *Astronomy*, fig. 2, represents the appearance of the two luminous spots, which, by an optical illusion, seem to project beyond the circumference of the disk. Mars seems to move from west to east round the earth: the mean length of a siderial revolution is $1^{\circ} 321^d 23' 30'' 35'' 6$. Its motion is very unequal: when it begins to be visible in the morning, it is direct and most rapid; it becomes gradually slower, and when the planet arrives at about $136^{\circ} 48'$ from the sun, it is stationary; the motion then becomes retrograde,

M A R S.

grade, increasing in velocity till the moment of opposition of the planet with the sun.

This velocity then becomes a maximum, diminishes and again becomes nothing when Mars approaching the sun is distant from it $136^{\circ} 43'$. Its motion then becomes again direct, after having been retrograde during 73 days, and in this interval the planet describes an arc of retrogradation of about $16^{\circ} 12'$. Continuing to approach the sun, it finishes by immersing in the evening in its rays. These singular phenomena are renewed at every opposition of Mars, but with a considerable difference as to the extent and duration of these retrogradations.

Mars does not move exactly in the plane of the ecliptic, but deviates occasionally several degrees. The variations in its apparent diameter are very great. It is about $10''$ in its mean state, and augments to $29''$ as the planet approaches its opposition. At this time the parallax of Mars becomes sensible, and is nearly double that of the sun. The same law which exists between the parallaxes of the sun and Venus, exists likewise between the sun and Mars, and the observation of this last parallax had given a very near approximation of the solar parallax before the transit of Venus had ascertained it with greater precision.

The disk of Mars changes its form, and becomes sensibly oval according to the relative position of the sun. These phases shew that it is from the sun it receives its light. From the observation of spots distinctly seen on its surface, it is inferred that it moves on itself from west to east, in a period of $1^d 0^h 44' 45''$. From observations made by Dr. Herschel in 1779, he concludes that the sidereal revolution of Mars cannot well be less than $24^d 39' 5''$, nor more than $24^d 39' 22''$.

The mean diameter of Mars is about 4000 miles, or nearly half that of the earth.

Its character is ♂. Its mean distance from the sun is

1.52369 of those parts, whereof the distance of the sun from the earth is 1.00000 ; its eccentricity $14,218$; and its real distance $145,014,148$ miles; its mean distance from the sun in semi-diameters of the earth $36,262$: the periodical time, in which it makes its revolutions round the sun, is 686 days 23 hours; which is the length of his year, and contains $667\frac{3}{4}$ of his days; every day and night together being 40 minutes longer than with us; and its revolution about its own axis is performed in 24 hours 40 minutes nearly. Its proportion of light, that of the earth being 1, is $.43$; proportion of bulk, that of the sun being $1,380,000$, is $\frac{1}{24}$; and of density, that of the sun being $\frac{1}{4}$, is $\frac{1}{16}$.

In the acronical rising of this planet, that is, when it is in opposition to the sun, it is found five times nearer to us than when in conjunction with him; and, therefore, he appears so much bigger and brighter at one time than another.

Mars, having his light from the sun, and revolving round it, has an increase and decrease like the moon: it may also be observed almost bisected, when in its quadratures with the sun, or in his perigæon; but never is seen corniculated, or falcated, as the inferior planets; which both shews that his orbit includes the earth's within it, and that he shines not by his own light. The phases of Mars were first discovered by Galileo.

This planet's distance from the sun is to the distance of the earth and sun, as $1\frac{1}{2}$ to 1; so that a man, placed in Mars, would see the sun's diameter less by one-third than it appears to us; and, consequently, the degree of light and heat, which Mars receives from the sun, is less than that received by the earth, in the proportion of 4 to 9. This proportion, however, will admit of a sensible variation, on account of the great eccentricity of this planet.

For the other elements of the orbit of this planet, the reader is referred to the article PLANET.

MARS, among *Alchemists*, signifies iron; because imagined to be under the influence of that planet. See IRON.

MARS *Saccharatus*. See IRON.

MARS *Sulphuratus*. See IRON.

MARS MARTIS, rust of iron. See CROCUS *martis*, and IRON.

MARS, *Crystals of*. See *Sulphat of IRON*.

MARS, called *Ares* by the Greeks, in *Mythology*, the god of war, the son of Jupiter and Juno, according to Homer and the other Greek poets, or, as Ovid tells the story, of Juno alone; she being displeas'd that Jupiter should have a daughter Minerva, without female aid: being therefore a son of discontent, he was made the god of war and strife. He had a sister called Bellona, the goddess of war.

Among the ancients, there were several princes of this name. The first, to whom Diodorus attributes the invention of arms, and the art of marshalling troops in battle, was the Belus, whom the scripture calls Nimrod, the mighty hunter (Gen. v.), who, after having practis'd his skill upon wild beasts, turned it against men; and having subdued a great number of them, declared himself their king. The second Mars was an ancient king of Egypt. The third was king of Thrace, called Odin, distinguished by his valour and conquests, and promoted to the honour of god of war, and called the Hyperborean Mars. The fourth is called the Mars of Greece, surnam'd Ares. The fifth, and last, is the Mars of the Latins, who entered into the prison of Rhea Sylvia, and begat upon her Romulus and Remus. In fine, the name of Mars was given to most warlike princes, and every country valued itself on having one, as well as a Hercules. Accordingly we find one among the Gauls under the name of Hefus; and, it is said by Lucian and Lactantius, that these ancient people sacrificed to him human victims. We find a Mars also among the Scythians. The Greeks threw into the history of their Mars the adventures of all that have been now nam'd. Arnobius represents the Mars of Greece as merely a deified man.

Although Mars was worshipp'd in several places, yet he was no where in such high veneration as at Rome, where he had several temples; among which, that dedicated to him by Augustus after the battle of Philippi, under the name of Mars the Avenger, was one of the most celebrated.

He had for his priests the *salii* and *flamines*, who from him were call'd *Martiales*. They sacrific'd asses to him, on account of the harsh dissonance of their voice. The vulture was a bird sacred to him, from their always flying to those places where armies are going to engage, and bloodshed is to be expected. The usual attributes of Mars are the helmet and spear, which he does not lay aside, even when he is going on his amours. Several of the old Roman poets of the first age speak of a wife of Mars, call'd Nerene, signifying, according to some, *mildness*, and given to him in order to soften and humanize the roughness of his temper; but we find no traces of her in their later poets. The temples of Mars were of the Doric order, and usually plac'd without the walls; hereby denoting that this deity was to preserve the walls from the perils of war.

MARS, *Games of, ludi Martiales*, were combats instituted at Rome in honour of the god Mars.

They were held twice in the year; once in the Circus, on the fourth of the ides of May; and a second time on the first of August. These latter were established some time after the other, in memory of the dedication of the temple of Mars on that day. These games consist'd in courses of horses, and combats with wild beasts. Germanicus is said to have killed two hundred lions in the Circus, on these occasions. See *FIELD of Mars*.

MARS *Diep*, in *Geography*, a road for shipping, at the entrance of the Zuyder see from the German ocean, between the coast of Holland and the Texel.

MARS *la Tour*, a town of France, in the department of the Moselle; 11 miles W.S.W. of Metz.

MARSA, in *Ancient Geography*, a town of Pannonia, near which the emperor Constantius gave battle to Magnentius, who had assumed the title of emperor of the Gauls.

MARSA, in *Geography*, a town of Africa, in the kingdom of Tunis; 10 miles N.E. of Tunis.

MARSAC, a town of France, in the department of the Puy de Dome; 30 miles N. of Le Puy.

MARSAGLIA, a town of France, in the department of the Stura; six miles N.E. of Mendovi.

MARSAL, a town of France, in the department of the Meurte; 17 miles E.N.E. of Nancy. N. lat. 48° 48'. E. long. 6° 41'.

MARSALA, a sea-port town on the W. coast of the island of Sicily, erected on the site of the ancient *Lilybeum*, which see.—Also, the name of a river, which runs into the sea, about a mile S. from the town of Marsala.

MARSAN, a small country of France, before the revolution, of which Monte de Marfan was the capital: now a part of the department of the Landes.

MARSANA BUXIFOLIA, in *Botany*, Sonnerat Voy. aux Ind. Orient. v. 2. 245. t. 139, so nam'd by that author as a compliment to the *Princesse de Marfan*, governess of the royal children of France, is no other than *Murraya exotica* of Linnæus. See MURRAYA.

MARSANNE, in *Geography*, a town of France, in the department of the Drome, and chief place of a canton, in the district of Montelimart; eight miles N.N.E. of Montelimart. The place contains 1075, and the canton 6177 inhabitants, on a territory of 212½ kilometres, in 14 communes.

MARSAQUIVER, or MARSALQUIVER, a sea-port of Algiers, on the coast of the Mediterranean, belonging to the Spaniards, who took it in the year 1732; three miles from Oran.

MARSCH, or MARK, a river which rises in the S. part of the county of Glatz, soon after enters Moravia, passes by Littau, Olmutz, Hradisch, &c. and runs into the Danube, at the boundaries of Aultria and Hungary, six miles above Preßburg, and 32 below Vienna.

MARSCIANO, a town of Italy, in the Perugiano; 22 miles S.S.W. of Perugia.

MARSDENIA, in *Botany*, received its name from the pen of Mr. R. Brown, in honour of William Marsden, esq. F.R.S. late secretary to the Admiralty, the learned author of the History of Sumatra; who, if not a practical botanist, has illustrat'd so many subjects connected with the science, and is on all occasions so liberal in his communications, that no one, who knows him or his works, can think the compliment misapplied.—Brown in Mem. of the Wernerian Society, v. 1. 28. Prod. Nov. Holl. v. 1. 460. Ait. Hort. Kew. ed. 2. v. 2. 84.—Class and order, *Pentandria Digynia*. Nat. Ord. *Contortæ*, Linn. *Apocynæ*, Juss. *Asclepiadæz*, Brown.

Gen. Ch. *Cal.* Perianth inferior, of one leaf, in five acute equal segments, rather small, permanent. *Cor.* of one petal, pitcher-shaped, or nearly wheel-shaped, in five bluntish segments. Crown of the stamens of five compressed, simple, undivided leaves, without any internal teeth. *Stam.* Filaments five, broad, flat, cloven at the top; anthers sessile on the inside of the filament, of two separate cells, terminated by a common membrane; masses of pollen project'd from the

the anthers upon the stigma in pairs, erect, sticking by their base. *Pist.* Germens two, superior, ovate; styles combined, very short; stigma single, generally simple, sometimes beaked, the beak either simple or divided. *Peric.* Follicles two, ovate-oblong, smooth. *Seeds* numerous, imbricated, comose.

Eff. Ch. Corolla nearly wheel-shaped, five-cleft. Crown of the Stamens of five compressed undivided leaves, without teeth. Anthers terminated by a membrane; masses of pollen ten, smooth, erect. Follicles smooth. Seeds comose.

The stem in this genus is rather shrubby, generally twining, round, scarcely angular. Leaves opposite, stalked, broadish, flat. Cymes or tufts lateral, between the footstalks. It is very nearly related to *Pergularia*; from which, according to Mr. Brown himself, it differs merely in the want of a tooth, or appendage, at the inside of each leaf of the crown. There appears however to be more of a tube in *Pergularia*, the corolla of which is truly salver-shaped.

Eight species are described by the author of the genus.

1. *M. velutina*. Soft-leaved *Marsdenia*.—Stem twining. Leaves heart-shaped, broadly ovate, pointed, downy and soft. Cymes umbel-shaped. Mouth of the flower naked.—Gathered by Mr. Brown in the tropical part of New Holland.

2. *M. tinctoria*. Indigo *Marsdenia*. (Tarram akkar; *Marsd.* Sumatr. 78.)—Stem twining. Leaves heart-shaped, ovate-oblong, pointed, nearly smooth, glandular in their forepart. Tufts lateral. Mouth of the flower bearded.—Native of Sumatra. Seen by Mr. Brown in the Banksian herbarium. This plant is said to afford the best indigo in Sumatra, and as Mr. Marsden appears to be the first person who has given any account of it, there is the more propriety in its bearing his name. For the indigo in general use, see *INDIGO* and *INDIGOFERA*.

3. *M. viridiflora*. Green-flowered *Marsdenia*.—Stem twining. Leaves oblong-lanceolate, smoothish, obtuse at the base. Tube of the flower slightly hairy within.—Gathered by Mr. Brown in New Holland, within the tropic.

4. *M. clausa*. Hairy-mouthed *Marsdenia*.—Stem twining. Leaves lanceolate, acute at each end, smooth; slightly rugose on the upper side. Mouth of the flower densely bearded.—Gathered in Jamaica, by professor Swartz, who gave it to sir Joseph Banks, but does not appear to have mentioned it in any of his works.

5. *M. suaveolens*. Sweet-scented *Marsdenia*.—Stem nearly erect. Leaves oval-lanceolate, smooth, veinless. Tube of the flower swelling; mouth bearded.—Native of New South Wales, about Port Jackson, where it was gathered by Mr. Brown, as well as by Dr. White. The character of the tube in this species seems, in that respect, to invalidate the above-mentioned distinction between *Marsdenia* and *Pergularia*.

6. *M. cinerascens*. Ash-coloured *Marsdenia*.—Stem erect. Leaves ovate, bluntish, veiny, slightly downy. Footstalks half an inch long. Corolla nearly wheel-shaped.—Found by Mr. Brown in the tropical part of New Holland.

All the above have a simple pointless stigma, and are considered by the author just mentioned as the most true and genuine *Marsdenia*. The two following have a beaked stigma.

7. *M. erecta*. Upright *Marsdenia*. Hort. Kew. as above. (*Cynanchum erectum*; Linn. Sp. Pl. 311. Willd. Sp. Pl. v. 1. 1258. Jacq. Hort. Vind. v. 1. 14. t. 38. *Apocynum primum latifolium*; Clus. Hist. v. 1. 124. *Periploca latifolia*; Ger. Em. 902.)—Stem erect. Leaves heart-shaped, ovate, acute. Cymes umbel-like. Segments

of the limb beardless, four times as long as the tube.—Native of Syria. Gerard had it in his garden, having received it, as he informs us, from "his loving friend John Robin, herbarist in Paris." (See *ROBINIA*.) It is marked by Mr. Aiton as a stove plant. Jacquin says it requires the shelter of a greenhouse at Vienna in winter, but flowers in the open air in June and July, though without bearing fruit. This is a smooth, upright, but weak, *shrub*, irregularly branched, five or six feet high, with pliant leafy twigs, somewhat disposed to twine round their neighbours. When wounded they are, according to Jacquin, not milky. *Leaves* imperfectly opposite, heart-shaped, acute, entire, glaucous, milky, an inch and half long, and an inch wide, on round footstalks half an inch in length. *Cymes* lateral, of numerous, white, fragrant flowers, smaller than hawthorn blossoms.

8. *M. rostrata*. Beaked Twining *Marsdenia*.—Stem twining. Leaves ovate, somewhat heart-shaped, pointed, smooth. Umbels many-flowered. Limb bearded.—Gathered by Mr. Brown in New South Wales. This species is said in his *Prodromus* to differ from its congeners, in having the masses of pollen kidney-shaped, and somewhat transverse, sticking upon the extremity of the stigma, at some distance from its glandular part. Hence the name *Nephrendra*, (from *νεφρῶν*, the kidney, and *δραστηρῆς*, a man,) alluding to the form of the impregnating substance, is suggested in that work, apparently under some idea of the plant's possibly constituting a genus by itself.

MARSEILLE, in *Geography*, a town of France, in the department of the Oise, and chief place of a canton, in the district of Beauvais; 11 miles N.W. of Beauvais. The place contains 700, and the canton 10,838 inhabitants, on a territory of 155 kilometres, in 18 communes.

MARSEILLES, a city of France, and principal place of a district, in the department of the Mouths of the Rhone, near the coast of the Mediterranean. For an account of its foundation and ancient state; see *MASSILIA*. This ancient city was for a long time an independent commercial republic, till at length, in the progress of the Roman conquests in Gaul, it was subdued by their arms; and under their government, it flourished in commerce, arts, and elegant literature. However, its opulence and glory perished in the common ruin of the Roman empire. The advantages of its situation at the foot of a rocky mountain, near the sea, caused its trade to revive, even in the ages of Gothic barbarism; nevertheless it languished under the government of the counts of Provence. Since its union with the other dominions of the kings of France, Marseilles has enjoyed a distinct municipal government and jurisdiction, under magistrates elected by the citizens. The subsidies which it formerly paid for the support of the French government were imposed by the king's edicts, and amounted to nearly one-third of the whole revenue paid by Provence. Marseilles is divided into the Old and New Town; the former lies on an eminence, consists of narrow crooked streets with mean houses, and is inhabited chiefly by fishermen and other poor people; the public streets are spacious and extensive, and the houses regularly built, elegant and commodious, which are occupied by opulent families, and by thriving merchants, tradesmen, and manufacturers. The port exhibits a noble spectacle of commercial industry, and the quay, in its prosperous state, was crowded with a busy multitude, consisting of people of all nations and languages; the neighbouring territory is thickset with villa, belonging to the wealthy inhabitants of the city; its trade extended to various parts of the globe, and its manufactures were various and extensive.

Before the revolution, this city was the residence of a bailiwick, and the see of a bishop; it had also four parish churches,

churches, including the cathedral, and two collegiate ones, with two abbeys, an academy of the fine arts, an observatory, and a mintage. Its arsenal was stored with all implements necessary for fitting out the galleys; its armoury, consisting of four walks intersecting one another, was reckoned the finest in the kingdom, and contained arms for 40,000 men. In the arsenal is a dock for building the galleys, which, being roofed over, and communicating with the harbour, is of a parallelogrammic form, having public and private buildings on the two long sides, and on one of the shorter, the other side affording an opening into the Mediterranean, and being defended on each point by a strong fort. The entrance into the harbour is rendered difficult by a rocky cape that is contiguous, nor has it depth of water sufficient for men of war. This port was frequented, before the revolution, by upwards of 4500 vessels in the course of a year. The number of inhabitants in the city, is reckoned at 111,130, and in the canton 115,394, on a territory of 310 kilometres, in two communes. N. lat. $43^{\circ} 17' 43''$. E. long. $5^{\circ} 22' 12''$.

MARSH, in *Agriculture*, a term applied to a tract of land lying on the borders of the sea, or any large river into which it flows. These tracts of land are mostly level, and converted to the purposes of grazing either with sheep or other animals. And in some districts, lands of this nature are subdivided or distinguished into two kinds, *salt marshes* and *fresh marshes*. The former are sometimes simply termed *salts* or *saltings*. They are the parts or portions of marsh grounds, which lie without the walls or embankments where such defences exist.

Marshes are for the most part of a rich deep alluvial nature in the qualities of their soils.

It is stated by the author of the Synopsis of Husbandry, in speaking of the marshes in the southern parts of the island, that they are subject to be overflowed at every spring tide, or at other times, when, by the violence of the wind, or the impetuosity of the tide, the water flows beyond its usual limits. "The goodness of the salts is in a great measure analogous to the fertility of the adjoining marshes; and the extent of them differs according to the situation, as in some places the tide beats directly against the wall, whilst in others the salts or forelands are of a considerable breadth." It is likewise added, that "in some places the grafs from salts is annually mown, and yields a short, delicate hay, that proves a very salubrious provender for sheep; but care must be taken to prevent its being carried off by the tide, for which reason it is often found necessary to bring it into the inclosures for making." It is added, that "these salt marshes are very efficacious in relieving many complaints incident to cattle, and are likewise useful in furnishing a considerable range for young sheep. In feeding them, however, some caution is to be used, and it will be necessary to remove the flock over the wall on the apprehension of a high tide, but more especially on the approach of spring tides, when the salts are usually overflowed. As the return of these latter is periodical, and a high tide may generally be before seen by those who are conversant in these matters, it rarely happens that any mischief ensues when there is no breach made in the wall; though there have been instances where sheep have been drowned on the salts, from a sudden and unexpected high tide, and others, where this misfortune has been the consequence of neglect, in not bringing the flock over the wall; or, as it is termed by the graziers, locking them on such occasions."

But the latter are those tracts of land that lie within the wall, and are very extensive in many parts of the kingdom. It is observed in the work just mentioned, that "Romney

marsh is by far the most extensive, and withal the most fertile of any level which comes under this denomination. It contains near 24,000 acres; besides which are Walland marsh and Dingle marsh, which are comprised within the walls, the former 12,000, and the latter 8000 acres." And it is stated, that "the internal regulations of these marshes are committed to the superintendance of expeditors. These are appointed by the Commissioners of Sewers, and are to take care that the repairs of the walls are maintained in due order, and that the costs attending the same be levied on each tenant, according to the number of acres occupied by him; for which purpose they are to cause assessments to be made out, with the names of the occupiers, and the rateable proportions to be borne by them respectively; and these rates, which must be confirmed by the commissioners, are termed scots; and that when any occupier refuses to pay his scot, the expeditors can obtain a warrant from the commissioners empowering him to distrain for the same, as for any other tax." These marshes are both appropriated to the purposes of breeding and feeding. Besides these marshes, there are vast tracts of them in various other parts of the kingdom. See **GRAZING**.

It is further suggested by the writer just noticed, that "the naked and exposed situations of marshes render them excessively cold in the winter, and no less subject them to the inconvenience of the parching heat of the sun in the summer months. To guard against these two extremes, it might, perhaps, be no unprofitable undertaking to form plantations of trees in different parts, which would operate as well for a shade against the sun's rays, as a defence to break off the winter blasts. Many trees might be fixed on for this purpose, which, delighting in a moist situation, seem in a very peculiar manner adapted to this use. Of this kind are the alder, the sycamore, the willow, and the poplar. Clumps of one or other of these trees being planted in different parts, would, it is supposed, be found very beneficial, and completely answer the purposes before mentioned. To every one who hath been conversant in husbandry, it is evident with what avidity cattle of every kind fly to the shade in the summer season; at which time they will even neglect their food to avoid the scorching heat of the sun, and the more intolerable stings of the insect tribe; so that in the middle of a summer's day, it is in vain to search for a flock of sheep in the uplands. At that time the hedges afford them a secure asylum; but in marshes, where this protection is wanting, it surely would be worth the trial to set about raising a shelter, which may answer in some respects the purposes of hedges in inclosures. Besides, as these aquatics are all of them quick in forming their shoots, a few years, in a soil propitious to their growth, will furnish a constant supply of poles adapted to cutting into rails, for which there is always a perpetual demand, and which will be no inconsiderable saving, not only in the original purchase of these articles, but in the carriage or conveyance of them likewise."

And it is asserted that "great profit is made by the renters of marshes in the neighbourhood of London bordering on the Thames, from joisting of horses, the pasture being deservedly accounted salubrious to that useful animal; for which reason, such horses as have been worn down by hard travel, or long afflicted with the farcy, lameness, &c. have frequently been restored to their pristine health and vigour, by a few months run in the marshes, especially on the salt-ings; but as every piece of marsh land in some measure participates of this saline disposition, so do they all of them possess, in a comparative degree, the virtues above-mentioned; and for this reason the Londoners are happy to procure a

run for their horses, at four or five shillings *per week*." And "another method practised by the graziers in the vicinity of London is, to purchase sheep or bullocks in Smithfield at a hanging market, which being turned into the marshes, in the lapse of a few weeks, are not only much improved in flesh, but go off at a time when the markets, being less crowded, have considerably advanced in price; and thus a two-fold gain is made from this traffic: and as many of the wealthy butchers of the metropolis are possessed of a tract of this marsh land, they have, from their constant attendance at Smithfield, a perfect knowledge of the rise and fall in the markets, and consequently are enabled to judge with certainty, when will be the proper time to buy in their stock, and at what period to dispose of them." These advantageous modes of traffic are confined solely to those graziers who reside in the vicinity of London. "In the Isle of Sheppey, where they proceed on different principles, the graziers never wish to depasture any horses; this animal being thought by them to do much injury to the marshes, especially in wet seasons, by trampling with his feet, and is moreover very apt to wade through the ditches, and to break down the dry fences. These are arguments sufficiently cogent to induce those graziers to reject the jointing of horses; whilst those who reside in the vicinity of the metropolis, where the weekly pay is larger, and they depend greatly on this method, are justified in adhering to a custom which they find turns out so considerably to their profit and advantage."

In many districts of the island that are situated on the borders of the sea, or near the mouths of large rivers, there are very extensive tracts of this description of land, which by proper drainage and inclosure may be rendered highly valuable and productive. This is particularly the case in Somersetshire and Lincolnshire, as well as that mentioned above, and others more to the north of the kingdom. In the former of these counties, vast improvements have, according to Mr. Billingsley, as stated in his Survey, been effected by the cutting rhynes and ditches, for the purpose of dividing the property, and the deepening of the general outlets, to discharge the superfluous water. Many thousand acres which were formerly overflowed for months together, and consequently of little or no value, are now become fine grazing and dairy lands.

The quantity that has been thus improved under the authority of parliament on Brent marsh, within these twenty years, is thus stated:

Names.	Acres.	
Westmore and Meare	4400	} with 1000 acres of turf-bog not yet improved.
Compton Bishop	300	
Glastonbury	1500	ditto 300 ditto.
Westhay, &c.	1700	ditto 1000 ditto.
Mark	2000	
Buntspil	1200	
Shapwick	100	
Blackford	900	
Wookey	900	
Westbury	450	
Bleadon	400	
West Pennard	250	
Eddington	1000	ditto 400 ditto.
Stoke and Draycot	800	
Nyland	350	
Wells	1150	
	<u>17,400</u>	

And that of these 17,400 acres, six parts of seven are cleared of stagnant water, and rendered highly productive; while the turf-bogs have been little improved. It is likewise added, that in the parish of Mark alone, 10,000 sheep have been rotted in one year, before the inclosing and draining were attempted.

And the same writer states, that the probable expence and subsequent improvement of the complete drainage of the above-named marsh and the river Axe, would stand thus:

Brent Marsh.		
Dr.		
To act of parliament gaining consent, &c.		£ 400
Sluice near the river Perrot	-	6
Twelve miles of new drain, average depth fifteen feet	-	12,000
Lowering river Brue three miles	-	1500
Purchase of land	-	2000
Bridges, hatches, &c.	-	2000
Sluice on Axe, near Hobbs Boat	-	500
One mile and a half new drain	-	1500
Lowering river Axe six miles	-	1000
Purchase of land	-	1000
Commissioners, surveyors, &c.	-	2500
		<u>24,406</u>
To balance of profit	-	331,844
		<u>356,250</u>

Cr.		
By 9000 acres of turf-bog improved at the most moderate computation 15s. <i>per acre</i> , making 6750l. <i>per annum</i> , twenty-five years purchase	-	168,750
By 15,000 acres of marsh flooded land 10s. <i>per acre</i> , or 7500l. <i>per annum</i> , twenty-five years purchase	-	187,500
		<u>356,250</u>

The view and statements which are here given fully shew the vast benefits that may be derived to individuals as well as the nation at large, by improving lands of the marsh kind by judicious draining, embanking, and other means. Yet, notwithstanding this, immense tracts of ground of this sort remain without improvement, and of course of very little value.

MARSH Land, a sort of rich pasture or grazing ground lying near the sea, or large rivers. In some places it is termed fen, but very improperly. See FEN.

Where marsh land lies flat, it is necessary for the owner to keep all the water he can from it. The sea-water in particular is to be kept from it as much as possible; and this is usually done at a very great expence, by high banks and walls. There are two things greatly wanting in these lands, in general, which are good shelter for the cattle, and fresh water. The careful farmer may, however, in a great measure obviate these by digging, in proper places, large ponds to receive the water, and by planting trees and hedges in certain places towards the sea, where they may not only afford shelter for the cattle, but keep off the sea breezes, which will often cut off the tops of all the grass in these places, and make it look as if mown with a scythe.

Experience hath shewn, that these sorts of lands fatten cattle the soonest of any, and that they preserve sheep from the rot. It would be of great advantage to them, if there

were raised, in the middle of every large marsh, banks of earth in a cross, or in the form of two semicircles, and these planted with trees; these would serve as a shelter for cattle, let the wind blow from what quarter it would, and would soon repay the expence of making the improvement.

In different parts of the kingdom there are very large quantities of land upon the sea-coasts that would be worth taking in, though little has yet been done in that way. The coasts about Boston, Spalding, and many other parts of Lincolnshire, give frequent instances of this, where the sea falls from the land, so that on the outside of the sea walls, on the owfe, where every tide the salt water comes, there grows a great deal of good grafs, and the owfe is firm to ride upon when the water is upon it. This owfe, when taken, hardly sinks any thing at all, and they dig the walls from the outside of it, all the earth they are made of being taken thence, the sea, in a few tides, filling it up again: and though the sea, at high water, comes only to the foot of the bank, yet once in a year or two, some extraordinary tide goes over the banks, though they are ten feet high. These banks are fifty feet broad at the bottom, and three feet at the top; the earth being all carried in wheelbarrows, and the face towards the sea, where the greatest slope is turfed.

In speaking of the Romney marsh lands, Mr. Bannister states, that "the natural situation of marsh land, so much beneath the surface of the uplands, renders it subject to be frequently covered with water in the winter time; and as this circumstance proves highly detrimental to the land, by protracting the growth of the grafs, and in causing it to be sour and ill tasted, no pains should be spared to resist the calamity, as well by keeping the ditches sufficiently cleansed, as by cutting drains in different parts of the marsh to carry off the superfluous water."

And also, "as the gate-ways in the marshes are apt to be very miry in the winter season, care should be taken to heighten the ground with stones, gravel, or chalk, which will render these passages much more comfortable to the drivers, no less than to the stock, especially milch cows, which being brought twice a day into the yard, would, but for this precaution, cause the gate-ways to be impervious in wet weather."

Besides, "when the summer turns out moist and growing, the herbage often shoots faster than the stock can eat it down. In this case it is common to brush over the marshes at the mowing season, though they had not originally laid in for that purpose; by which economy the farmer becomes possessed of a much larger portion of hay than he had before formed an expectation of, and which, in counties where this commodity fetches a good price, is an advantage whereof he has a right to avail himself; for these casual brushings may probably furnish him with a quantity of winter provender, sufficient to his own use; whilst those marshes which were primarily intended to be mown, and have been designedly laid in with that view, will produce a commodity of a better quality and more saleable, that may be disposed of at market. Those graziers, on the contrary, who live at a distance from the market, and are on account of their local situation obliged to pay larger wages to their workmen, slight the opportunity of increasing their stock of hay; and in cases where the humidity of the summer hath rendered it necessary to mow the bullock pastures, in order that the succeeding shoot of grafs may be more sweet and toothsome, have made a free gift of the same to those who have engaged to clear it off the ground." "On the removal of this old grafs, the ground is left at liberty to send forth a more vi-

gorous shoot in the autumn, so that these rouens at that time produce a sweet and wholesome pasturage, which would otherwise have been choaked up with the rotten core of the last year: yet there are cases where it may be necessary to suffer this old grafs to remain on the ground, as where a portion of food is required for the cows or other horned beasts in the winter. Then this old core, having been sweetened by the frosts, will be found exceedingly useful, and the cattle will at that time greedily devour, what in the summer months they turned from with disgust and indifference.

This sort of management is only required in particular cases; in others the grafs never becomes coarse and rank, but, on the contrary, remains close and fine in the marshy pastures.

MARSH Trefoil. See MENYANTHES.

MARSH, NICHOLAS, in *Biography*, an eminent Irish prelate, was born at Hannington, in Wiltshire, in the year 1638. He finished his education at Magdalen college, Oxford, where he took the degree of B. A. in 1657. In the following year he was elected fellow of Exeter college, and proceeded as a member of that college M. A. in 1760, D. D. in 1671. During these periods he was made chaplain to Dr. Ward, bishop of Exeter, and afterwards to the earl of Clarendon, lord chancellor. He obtained some other preferment, and in 1678 he was nominated to the vacant provostship of Dublin college, where he discharged the duties of his high trust with such fidelity and regularity, that his conduct has been held up as a pattern to all his successors. In 1682-3, he was promoted to the sees of Leighlin and Ferns, and in 1690 he was translated to the archbishopric of Cashel, from thence to Dublin, and from Dublin to Armagh. While he filled the see of Dublin, he built a noble library, which he enlarged after he became primate, and furnished with a choice collection of books. He endowed an hospital at Drogheda for the reception of twelve widows of decayed clergymen, to each of whom he assigned an apartment, and twenty pounds a year for maintenance. He extended his bounty to the encouragement of the propagation of the Gospel, and to other munificent and charitable institutions; presenting a number of oriental MSS. to the Bodleian library at Oxford. After having lived many years in great honour and reputation, and been seven times appointed one of the lords-justices of Ireland, he died, in the 75th year of his age, in 1713. He was a man of extensive and deep learning; and in his personal character he was pious, amiable, and exemplary. As an author, his principal piece was "An introductory Essay to the Doctrine of Sounds," containing some proposals for the improvement of Acoustics, printed in the Philosophical Transactions of the Royal Society of London. *Biog. Brit.*

MARSH, *Cape*, in *Geography*, a cape on the south coast of New Georgia. S. lat. 9° 21'. E. long. 150° 56'.

MARSH *Creek*, a river of North America, which runs through Malden township, in Upper Canada, and discharges itself into lake Erie.

MARSH'S *Island*, the largest of a group of 13 islands at the Great Falls in Penobscot river, all lying within seven miles of one another. Marsh's island is about five miles long and two and a half wide, and estimated to contain about 5000 acres. Round this island are five falls, one of which is distinguished by the name of "The Great Falls," or "Old Town Falls."

MARSH-*Effluvia*, or *Miasmata*, in *Medicine*. See EFFLUVIA and MIASMA.

MARSH-Fever, the fever occasioned by respiring the miasms, which exhale from swampy ground. This is various under the different circumstances which produce it; but it is always a fever of paroxysms, occurring at regular intervals. In temperate climates and cool seasons, it is an intermittent, or ague; in warm countries, in hot autumnal weather, it is a remittent, of tedious and difficult cure; and in the hot seasons of hot climates, it is the bilious remittent, or yellow fever, so fatal to strangers recently arrived from colder latitudes. In an able treatise on yellow fever, lately published by Dr. Bancroft (in 1810), it is satisfactorily shewn, that these different forms of fever are the offspring of the same cause; and that in proportion to the heat of the climate and season, to the comparative cold of the climate from which the patient has come, or of the season which has preceded, to the concentrated state of the miasmata, and to the full exposure which has been undergone, in the same proportion will the fever commence more speedily, be more violent in its attack, and more rapid and dangerous in its course, and from these circumstances alone, all the varieties of periodic fevers, from the yellow fever, which commences within twelve hours, to the mild vernal ague, which lies dormant from autumn to the ensuing spring, are produced. See EFFLUVIA, HEAT, MIASMA, REMITTENT.

MARSH Landers, in *Rural Economy*, a term provincially applied to neat cattle of the short-horned breed, or such as are bred on lands of the marsh kind, in different places.

MARSHAL, or **MARESCHAL**, *Marescallus*, primarily denotes an officer, who has the care or the command of horses.

Nicod derives the word from *polemarchus*, *master of the camp*; Matthew Paris from *Martii senescallus*. In the old Gaulish language, *march* signified *horse*; whence *mareschal* might signify him who commanded the cavalry. Spelman, Skinner, and Menage, derive it from the German *maer*, *marre*, a *mare*, or even a *horse*, and *schalk*, *servant*; which makes some imagine the title was first given to farriers, or those who shod and bled horses; and that, in succession of time, it passed to those who commanded them. Paquier makes four several derivations for the four several kinds of marshals in use among the French; *viz* *marshals of France*, *marshals de camp*, *marshals de logis*, or quarter-masters, and farriers, who are also called by the name of marshals. The third he derives from *marche*, or *marchir*, to *mark*, *limit*; and the last from *maire*, *master*, and *chal*, *horse*.

That the marshal was an officer of considerable note in Germany, France, and elsewhere, must incontrovertibly be acknowledged; but the exact time of the first institution of his office cannot now be so well ascertained. At first, the marshal or marescallus was, probably, an officer of inferior rank, to whose direction and management sovereign princes confided the care of their horses. Some have supposed the marescallus and the "Comes Stabuli" to have been the same officer under different titles; whilst others, allowing the functions of these officers to have been originally different, contend that they were united in, and for a long time after their institution continued to be exercised by, one and the same person. This contrariety of opinion seems to have arisen from confounding the officers of the Western empire in its early state with those established in it at a subsequent period, as well as with those of France, Italy, and of the Eastern empire. In the early times of the Western empire, whilst the "Comes Stabuli" remained a mere officer of the household, and uninvested with a military employment, no mention of a marescallus occurs among the officers of

the crown. In those times the "Marescalli" were only ministerial to the "Comes Stabuli," and the same difference subsisted between them as between menial servants and their masters. The "Comes Stabuli" was a high officer of the emperor, who appointed him to that office, and committed to him the superintendency of the imperial stables and stud; whereas the "Marescalli" were persons acting under him in a servile station, and employed in dressing, feeding, and training a limited number of the emperor's horses. Afterwards the promotion of the "Comes Stabuli" to the military dignity of commander-in-chief of the army, opened the way for the "Marescalli" to emerge out of their obscurity, and to rise to a more exalted station than they had before enjoyed: for on account of their skill in the several branches of horsemanship and the management of cavalry, the "Comes Stabuli" selected one of them to reconnoitre the position and to watch the motions of the enemy; to assign the quarters and lodging for the soldiery; to station the piquets, and direct the foragers. The office of "Marescallus," thus raised from servility, soon attained to great dignity and power; insomuch that the leading of the van of the army, the command of the cavalry, and the making of the first attack on the enemy, were annexed to it. After the decline, and upon the new-modelling of the empire, the office of the "Comes Stabuli" was sunk into that of the "Marescallus," who from that time exercised the functions of each, and became the most considerable officer in the state. The French, from almost the earliest times of their monarchy, had both Constable and Marshal. (See CONSTABLE.) The Marshal is mentioned in the "Leges Salicæ," in the capitularies of Charlemagne, and by several of the contemporary writers of that age. The "Marescallus," from his first institution in France, was considered as subordinate to the Constable, whose minister he was both in war and peace. His authority, however, was great, and in many respects so nearly equal to that of his principal, that his office was ever personal, and granted for life only. The French were so jealous of the power of their marshals, which became important from their prerogative of leading the van of the army, that they used every precaution for preventing the office from becoming hereditary in one family.

Among our Anglo-Saxon ancestors there was an officer, distinguished by the appellation of "Heretog," or "Heretoch," (derived from *hepe*, *exercitus*, and *tozen*, *ducere*), who, according to the additions to the laws of king Edward the Confessor, was the same officer as the French styled either "Constable," or "Marshal." The identity of these officers has, however, been questioned, and it has been alleged, that there were essential differences, as well in the constitution as in the functions of these officers. Each county or shire in England had its peculiar "Heretoch;" but in that age the French had only one "Constable," or "Marshal," in their kingdom in commission at the same time. The "Heretochii" were military officers of the public, and each of them was annually elected by the common suffrage of the people of his own county: whereas the "Constable" and "Marshal" of France were civil as well as military officers of the crown, appointed by the sovereign only, and generally for life. The power of the "Heretoch" extended no farther than to the leading of the forces of that particular county, by which he was chosen to be their military chief; but the authority of the "Constable," and under him of the "Marshal," extended over the whole national army. The "Constable" of France was the third person in the kingdom in point of rank, and next to him was the "Marshal;" but the "Heretoch," even in his own county court, was placed next below the sheriff,

and immediately before the "Trithingreve." When the "Heretoche" had conducted the forces of his own county to that part of the kingdom where the king thought proper to assemble his army, and they had joined the main body, his command was superseded, and he himself became subject to the orders of the commander-in-chief; whereas the "Constable" and "Marshal" had the management and direction of the campaign, and the various operations of the war, acknowledging no superior in command except the king, when he was personally present. In time, the "Heretoche" was no other than a colonel of a county militia, acting under the commander-in-chief of the king's forces. Duke William, even before his invasion, and more especially afterwards, must have known the great difference between the officers of the Anglo-Saxons and those of the French and Normans too well to have interpreted the "Heretoche" by either "Constable" or "Marshal;" and if so, he cannot have been author of the additions to the Confessor's laws. These additions, it is supposed, were not formed till the latter part at least of the reign of king Henry II. and probably not till after his death; about which time the Germans and Italians, confounding together the two offices of "Constable" and "Marshal," not only used the words "Constabularius" and "Marescallus" as synonymous, but constantly gave the appellation "Contabilis" to the leader of every party and detachment of the soldiery.

We find the term "Marshal" used in the duchy of Normandy for an officer vested both with authority and jurisdiction, and that officer grown up there to the meridian of his dignity and power, before William's invasion of our island, and therefore, if we had not any positive evidence of the fact, yet it would be highly probable that he brought the name and office into England at the time of the conquest, in the same manner as the princes of the Norman lineage carried both to Sicily and Naples: and of this we are assured by the chronicle of Normandy, which expressly tells us, that the Conqueror made Roger de Montgomery and William Fitz-Osborne "Marshals" in England. This office, next to that of the "Constable," was conferred for several generations, in the family of the Clares, earls of Pembroke; after which, reverting to the crown, it was held by different great personages, till the 25th of Henry VIII., when it was granted to Thomas Howard, duke of Norfolk, and his heirs male for ever, with power to exercise it by deputy; since which time, it hath, with some interruptions arising from attainders, and other consequences of civil dissensions, continued in that family.

Mr. Madox (Hist. Excheq. c. 2.), describing the office of the king's mareschal, or mareschal of England, says it was executed partly in the king's army, in time of war, and partly in his court, in time of peace. Of the military functions of this office he merely says, that he and the constable were to give certificates to the barons of their having duly performed the service required of them in the king's armies; which seems to shew that these officers had a legal superintendency over those armies. But from other accounts, it appears, that in the reign of Edward I., the mareschal's post was in the van-guard, and that it was his duty, and that of the constable, to muster the forces. (See Rymer, vol. ii. p. 783.) His civil duties were (as Madox has collected them from ancient records), to provide for the security of the king's person in his palace, to distribute the lodgings there, to preserve peace and order in the king's household, and to assist in determining controversies among them. He also performed certain acts, by himself or his substitutes, at the king's coronation, at the marriage and interments of the royal family, at the crea-

tion of barons and knights, and at other great and ceremonious assemblies in the king's court. It is said in the dialogue "De Scaccario," (already cited) that no business of importance ought to be done without his being consulted. See EARL-Marshal.

Besides the earl-marshal, there were, during the reigns of our Norman race of sovereigns, and also in subsequent and still later times, marshals, whose employments, or marshal-feas, were different from, and subordinate to, those of that great officer. Our ancient records take notice of some officers by the name of marshals, who are mentioned only in general to have been servants of the king's household; and we find by the patent-rolls, that king Henry III. had no less a number of marshals than seven continually attending upon him in his court; for which service, each of them was paid by the keeper of the wardrobe, the yearly wages of twenty marks. This, indeed, will not seem extraordinary, when it is considered, that the being "marshal," or having the "marshalfea" of a thing, meant no more than being the director, or having the oversight, charge, or ordering of it. Accordingly, Mr. Madox specifies several officers of the king's household under the several denominations of marshals of his *horses*, of his *birds*, and of his *measures*.

The marshal, as well as the *Constable* (see that article), in consideration of the services which his office required, had various fees and emoluments, as well as certain rights and privileges; which belonged to him, partly as a military officer, and partly on account of his attendance about the king's court. They are specified by Grose in his "Military Antiquities," vol. i. p. 194, &c. and by Edmondson in his "Complete Body of Heraldry," vol. i. p. 66. It is hardly necessary to add, that at present the earl-marshal is not considered as a military officer.

MARSHAL of England, Earl. See EARL-Marshal.

MARSHAL, Knight, or *Marshal of the King's House*, is an officer, whose business, according to Fleta, is to execute the commands and decrees of the lord steward, and to have the custody of prisoners committed by the court of verge. Under him are six marshal's men, who are properly the king's bailiffs, and arrest in the verge of the court, when a warrant is backed by the board of green-cloth. The court where causes of this kind between man and man are tried, is called the *Marschalfea*, and is under the knight-marshal. See COURT.

This is also the name of the prison in Southwark; the reason of which may probably be, that the marshal of the king's house was wont to sit there in judgment, or keep his prison.

There are some other inferior officers of this name; as

MARSHAL of the justices in eyre.

MARSHAL of the king's bench, who has custody of the prison called the king's bench in Southwark.

This officer gives attendance upon the court, and takes into his custody all prisoners committed by the court; he is fineable for his absence, and non-attendance incurs a forfeiture of his office. The power of appointing the marshal of the king's bench is in the crown. 27 Geo. II. c. 17. See COURT of King's Bench.

In Fleta, mention is also made of a *marshal of the exchequer*, to whom the court commits the custody of the king's debtors, &c.

MARSHAL, or *Mareschal*, of France, was, during the monarchy, the highest dignity of preferment in the French armies. This dignity was for life, though, at its first institution, it was otherwise. They were then only the king's first ecuyers under the constable, but in time they became the constable's lieutenants in the command of the

army,

army, the constable himself being then become captain-general. At first they were but two in number, and their allowance was but five hundred livres *per annum* in time of war, and nothing in time of peace; but in the reign of Francis I. a third was added; Henry II. created a fourth. Since it has been various: Lewis XIV. increased it to twenty. Their office at first was to marshal the army under the constable, and to command in his absence.

They did then what the *marshals de camp* did afterwards; to which last they transferred their title, and the least considerable part of their authority.

The first marshal performed the office of constable in an assembly of the marshals.

MARSHAL, *Arch.* See ARCH-MARSHAL.

MARSHAL, *Clerk.* See CLERK-MARSHAL.

MARSHAL, *Field.* See FIELD-MARSHAL. This denomination is likewise given as an honorary rank to general officers who have no immediate command.

MARSHAL, *Provost.* See PROVOST.

MARSHAL, *Sub.* See SUB-MARSHAL.

MARSHALS of Arms, in *Heraldry*, have been ranged by some authors as a different order of officers of arms; and whilst some have attributed this title to Pursuivants, others have asserted, that there are belonging to, and depending upon, the office and officers of arms, certain ministers, whom they call marshals to heralds. The word "marshal," in this case however, signifies no other than a deputy to a king of arms, of a whole realm, or of any province or march within it, substituted and appointed to perform the duties of such king of arms in his absence, or when he happens to be employed in other offices of the public; and to be a sort of coadjutor, or assistant to him, when he thinks proper to use him in that capacity. The denomination of marshal is undoubtedly very ancient, in this country as well as in foreign parts; of which Edmondson mentions many instances. Complete Body of Heraldry, vol. i.

MARSHALL, THOMAS, in *Biography*, was born at Barkby, in Leicestershire, about the year 1621. He was instructed in grammar-learning by the vicar of his native town, and was, in 1640, entered at Lincoln college, Oxford, where, in the following year, he was elected a scholar on Trapp's foundation. When the civil wars broke out, he bore arms in defence of the king at his own cost; and upon the approach of the parliamentary visitors in 1647, he left the university, went to the continent, and became preacher to the company of English merchants at Rotterdam and Dort. While he was abroad, he was, without his knowledge, elected fellow of his college, and made doctor of divinity. These honours recalled him to his native country, and to Oxford, where he was elected rector of his college in the year 1672. He was afterwards appointed chaplain in ordinary to his majesty; in 1680, he was presented to the rectory of Bladon, near Woodstock, in Oxfordshire, and in the following year he was made dean of Gloucester. He died at Lincoln college in 1685, and left all his books and MSS. to the public library, which did not already form a part of it, and the remainder he gave to Lincoln college. He likewise founded three scholarships, supported by rent-charges on different estates. He was a very learned man, and deeply skilled in the Saxon and Eastern tongues, and was eminent for his strict piety, profound learning, and other valuable qualifications. He was author of "Observationes in Evangeliorum Versiones per antiquas duas, Gothica scilicet et Anglo-Saxonica, &c." 4to. 1665. "An Epistle prefixed to Dr. Hyde's Translation into the Malayan Language of the Four Gospels;" and other pieces.

MARSHALLIA, in *Botany*, is a species adopted by

professor Martyn from Schreber, who named it in honour of Mr. Humphrey Marshall, author of *Arbustum Americanum*, the American grove, or an alphabetical catalogue of forest trees and shrubs, natives of the American United States."—This work was published at Philadelphia, in 8vo. in 1785; and a French translation appeared at Paris in 1788.—Nothing is known of *Marshallia*, but from Schreber, and according to his generic character, it should be placed between *Serratula* and *Pteronia*. Schreb. 810. Mart. Mill. Diæt. v. 3.—Class and order, *Syngenesia Polygamia Æqualis*. Nat. Ord. *Compositæ Capitata*, Linn. *Cinerocephala*, Juss.

Gen. Ch. Common calyx spreading, of numerous, linear-lanceolate, obtuse, concave, nearly equal, permanent scales. Cor. compound, uniform, longer than the calyx; the florets hermaphrodite, equal, numerous, of one petal, funnel-shaped, villose; tube the length of the calyx; limb somewhat ventricose, divided into five, linear, rather erect segments, two of them more deeply separated. Stam. Filaments five, capillary; anthers cylindrical, tubular, as long as the limb. Pist. Germen ovate; style thread-shaped, a little longer than the stamens; stigmas two, recurved. Peric. none, except the permanent calyx. Seeds solitary, ovate, five-sided, downy, with a crown of five small, ovate, pointed, erect, membranous leaves. Recept. flat, chaffy; scales linear, a little dilated, and obtuse at the top, green, the length of the calyx.

We are not aware that any species of this genus has been yet described. Willdenow has not enumerated any in his extensive work, so that the above character is all that is at present known relative to the matter.

MARSHALLING a Coat of Arms, in *Heraldry*, signifies the due and proper joining of several coats of arms belonging to distinct families in one and the same shield, or escutcheon; by *impaling* and *quartering* (which see); or, according to Nisbet, marshalling of arms is when enigns of honour, or the entire arms of other families, are joined with the paternal ones of the bearer by partition lines, making distinct arms or compartments in one shield.

Marshalling is also to be extended to the disposition of the appurtenances of such arms, in proper places without the escutcheon.

MARSHALLSVILLE, in *Geography*, a place of America, in Muhlenburg county, Virginia; in which is a post-office; 258 miles from Washington.

MARSHALSEA. See COURT of *Marshalsea*.

MARSHAM, Sir JOHN, in *Biography*, a well known writer, born in 1602, at London, received his early education at Westminster school, from which place he was sent to St. John's college, Oxford, where he took his degree of M.A. in 1625. He now made a tour on the continent, and returning to London, entered at the Middle Temple for the study of the law. In 1629 he visited the Low Countries and Paris, in the suite of Sir Thomas Edmondson, ambassador extraordinary to Lewis XIII. Resuming his legal studies after his return, he was appointed one of the six clerks in chancery in 1638. In the civil wars he adhered to the royal side, and was plundered of a considerable part of his estate, but on the restoration he was elected one of the representatives in parliament for the city of Rochester, was restored to his place in chancery, and received the honour of knighthood; and in the course of two or three years after this he was created a baronet. He died in 1685, leaving behind him a character for great learning in the languages, history, and chronology. The first fruit of his studies was "Diatriba Chronologica," in which he examines the principal difficulties occurring in the chronology of the Old Testament. He wrote the preface to the first volume of

of the "Monasticon Anglicanum," but his principal performance is entitled "Canon Chronicus Ægyptiacus, Ebraicus, Græcus, et Disquisitiones." In this he proposed to the learned world the hypothesis of four collateral dynasties of Egyptian kings, reigning at the same time over different districts of that country, in order to reduce the chronology of the Egyptian records to a conformity with that of the Hebrew scriptures. Sir John supposes that the Jews derived their several rites from the Egyptians, and limits the prophecy of Daniel's weeks to the reign of Antiochus Epiphanes. He left at his death, in an unfinished state, a fifth book of his "Canon Chronicus," containing the Persian empire. *Biog. Brit.*

MARSHFIELD, anciently *Meresfield*, in *Geography*, a market-town and parish in the hundred of Thornbury, Gloucestershire, England, is situated on the borders of Somersetshire and Wiltshire, seven miles distant from Bath, 13 from Bristol, and 102 from London. The manor was anciently part of the demesnes of the crown, but soon after the conquest was given to the see of Wells to be holden as of the honour of Gloucester. It afterwards came to the earls of Gloucester; William, the second earl, gave it to the abbey of Keynsham, which he had founded for Black canons, in the reign of Henry II. In this abbey the manor continued till the dissolution; since which period it has passed, by grants, descent, and purchase, to various possessors, and is now the property of Christopher Codrington, esq. The parish of Marshfield is sixteen miles in circumference; the town, which stands in the centre, consists principally of one street, of a mile in length. It is governed by a bailiff, annually elected at a court-baron, whose power, however, though he is attended by a serjeant at mace, extends but little farther than the examination of weights and measures. A weekly market is held on Thursdays, which, with the two annual fairs, were first granted to the abbot of Keynsham in the year 1262, renewed at various times, and finally confirmed by James I. In the population survey, under the act of 1800, Marshfield was stated to contain 265 houses, occupied by 1246 persons. The chief trade of the inhabitants is malt-making, which is carried on to a considerable extent. The parish church is a spacious structure, consisting of a lofty nave, two aisles, and a well finished tower. The whole building is in the style of the age of Henry IV., and was probably erected by the abbot of Tewksbury, to whom, at that period, the impropriation belonged. On the left hand of the high altar are three sub-fellia, or stone stalls, with light canopies and finials, where the officiating priests used to be seated.

Upon a great common, called the Downs, are the evident remains of ancient intrenchments; near which are five tumuli, or barrows; the largest is called Oswald's tomb. The traditional account of this being the grave of Oswald, king of the Northumbrians, is not supported by history.

At a place called the Rocks, near the town, are three stones set up to mark the limits of the three counties of Gloucester, Wilts, and Somerset, which meet here in a point. Rudge thinks that from this circumstance originated the ancient name of the parish, *meare* being an Anglo-Saxon word for limit or boundary. *Rudge's History of the County of Gloucester*, 2 vols. 8vo. 1803.

MARSHFIELD, a post-town of America, in Plymouth county, Massachusetts, bounded S. by Duxborough, and 36 miles S.E. of Bolton; incorporated in 1640, and containing 1266 inhabitants.—Also, a township in Caledonia county, Vermont, adjoining to Calais on the N.W., and Peacham on the N.E.; containing 170 inhabitants.

MARSHPEE, or **MASHPEE**, an ancient Indian town

of America, in Barnstable county, Massachusetts, containing 155 inhabitants. In this town is an Indian church, but the number of Indians does not exceed 40 or 50 persons.

MARSHY HOPE, the N.W. branch of Nanticoke river, in Maryland.

MARSHY Lands, in *Agriculture*. See **MARSH-Land**.

MARSICO NUOVO, in *Geography*, a town of Naples, in Principato Citra, the see of a bishop, suffragan of Salerno; 18 miles N. of Policastro.

MARSICO Vetere, a town of Naples, in the Basilicata; 14 miles S. of Poteriza.

MARSIGLI, LEWIS-FERDINAND, *Count*, in *Biography*, a soldier and philosopher, was born in 1658, of a good family, at Bologna. He was brought up from his earliest youth in manly exercises, but was, at the same time, extremely attentive to his studies, particularly in mathematics and natural history. In 1679, he accompanied a Venetian envoy to Constantinople, where he employed himself in procuring information of all kinds relative to the Turkish empire. The result of his enquiries, he published in "Observations concerning the Thracian Bosphorus," which he addressed to Christina of Sweden: this work was published at Rome in 1681. The remarks which he collected respecting the civil and military state of the Ottoman empire, and the rise, progress, and decline of that power, did not appear till after his death. He remained at Constantinople eleven months; and after his return he went to Vienna, and offered his services to the emperor Leopold. They were accepted, and his skill in fortification was employed in constructing works for the defence of the river and island Raab. He was rewarded with a company of infantry, but in a short time he fell into the hands of the Tartars, who sold him for a trifling sum to the governor of Temeswar, by whom he was carried as a slave to the siege of Vienna, where he was again sold, and endured incredible hardships, till his friends found means of redeeming him. He was soon after this employed to superintend the cannon foundery at Vienna; and in the course of the employment, he made many experiments on the strength and action of gunpowder, which he communicated to the celebrated Viviani. He was entrusted with important commands in the army, and had a large share in the capture of Buda, from the plunder of which he secured for his share several oriental manuscripts. He was raised to the rank of colonel in 1688, and was deputed by the emperor to the pope for some political negotiations, which he conducted with great dexterity. During the remainder of the war he served in Hungary, where he was employed in constructing bridges over the Danube and other rivers, and in protecting the encampments. From the variety of his talents, civil and military, he was in great esteem with the imperial commanders, and was frequently consulted on important occasions, and was at length appointed the imperial commissioner for fixing the boundaries between the two empires in Hungary and Dalmatia. When the succession war between the emperor and his allies broke out in 1702, he accompanied the king of the Romans to the siege of Landau. He was afterwards sent with his regiment to garrison the important fortrefs of Brisac, and acted as second in command under the count of Arco. Great dissensions prevailed between the two generals, and the place surrendered after a short resistance. The court of Vienna instituted a legal enquiry into the facts, in consequence of which Arco was beheaded, and Marsigli deprived of all his honours and employments. He attempted to procure a revision of the sentence from the emperor, but being unsuccessful in his efforts, he retired to Switzerland, and wrote a justification of his conduct, and then applied his

mind with redoubled ardour to scientific pursuits. Having spent a good deal of time in admiring the wonders of nature in Switzerland, he visited France, and took up his residence near Marfeilles, where he cultivated his garden, and particularly examined all the productions of the sea-shore. In 1709, count Marfigli was called from his retreat by pope Clement XI. to be placed at the head of his troops, but he soon found that he should gain no reputation in the papal service, and withdrew altogether from military life. He appeared now in a new character, and founded the "Institute of Bologna." His object was principally to promote the improvement of various branches of science, viz. astronomy, chemistry, natural history, physics, and military architecture. He spared no pains nor expence in obtaining instruments adapted to the illustration and advancement of science, and having the pope's consent to a new foundation, and fixed its laws and regulations, he solemnly confirmed the gift in 1712. The senate of Bologna purchased the principal palace in the city for its accommodation, an observatory was erected in it, professors were appointed, and the Institute took its proper form. The gratitude of his fellow citizens for this and other liberal acts performed for them, was expressed in a decree for placing his statue in some conspicuous situation, but he steadily refused the honour. To avoid the consequences of some litigious disputes, he accepted the employment offered by the pope of surveying the sea-coast of the territories of the church, in order to fortify it against the incursions of the African corsairs. He made use of this opportunity to augment the materials for his natural history, an object which he pursued in a tour through the whole mountainous tract of the districts of Bologna and Modena. After this he visited Holland and England, and in the course of his journey formed an acquaintance with Newton and Halley, Boerhaave and Muschenbroeck; he became a member of the Royal Society of London, and returned laden with books and specimens of natural history for the Institute. At Amsterdam the booksellers agreed to print the work which he had been preparing several years, and which was published under the title of "Histoire Physique de la Mer," in the year 1725. In the following year he printed another great work, which was regarded as the most valuable of all his publications, entitled "Danubius Pannonico Mysicus," in six volumes folio. This is a description of the Danube in its Hungarian and Turkish course. It commences with geographical and hydrographical observations; from thence it proceeds to the history and antiquities of all the places washed by its stream; to the mineralogy, zoology, and botany of its borders, and concludes with meteorological and physical remarks. In 1727, Marfigli presented his Institute with the scientific treasures that he had acquired in his last travels, and in the following year sought a peaceful retreat in Provence, but a slight apoplectic attack induced him to return to his native city, where certain domestic vexations to which he had been subject through life, were now terminated by the death of his brother. One of the motives for his return was to attend to the education of that brother's son, to which he thought himself bound by the obligations of duty, notwithstanding past dissensions. A temporary amendment in his health proved but of very short duration, and he died November 1st, 1730, at the age of seventy-two. The count was, according to the religion of his country, remarkably devout, and had a particular veneration for the Holy Virgin, to whose especial care he attributed all the prosperous events of his life. He was author of many other works, besides those that have been already

referred to, among which may be mentioned "A Dissertation on the Bolognian Phosphorus;" "Memoir concerning the Flowers of Coral;" "Dissertation on the Generation of Fungi;" "On Trajan's Bridge," &c. Gen. Biog.

MARSILEA, in *Botany*, so named by Linnæus, in commemoration of count Lewis Ferdinand Marfigli, founder of the Academy of Sciences at Bologna. (See MARSIGLI and LEMMA.) An error of the printer's in the latter requires correction; for *corolline* read *coralline*. Linn. Gen. 560. Schreb. 754. Mart. Mill. Dict. v. 3. Brown. Prodr. Nov. Holl. v. 1. 167. Spreng. Crypt. 207. t. 5. f. 42. Lamarck Illustr. t. 863. (Lemma; Juss. 16.) Class and order, *Cryptogamia Filices*, Linn. *Cryptogamia Miscellanea*, Schreb. Nat. Ord. *Filices*, Linn. Juss. *Marsileaceae*, Brown.

Eff. Ch. Involucrum ovate, closed, of many androgynous cells, in two rows. Anthers numerous, clustered round the base of the pistils, of one cell, with globose pollen. Germens in two rows, sessile, oval.

Obf. Mr. Brown, who has most recently investigated this genus, is by no means certain about its parts of fructification. He observes that the reputed germens are full of a granular matter, whose particles are nearly oval, pellucid, very easily separable, but not soluble in warm water. He has often remarked, in the centre of the germen, an oblong body of a larger size, at first sight homogeneous; but on being immersed in water, it quickly dissolved into particles similar to the above. What is presumed to be pollen, consists of grains larger and more opaque than those found in the germen.

The stem is creeping, throwing out tufts of fibrous roots here and there, and from the same parts bearing numerous quaternate leaves, on long upright footstalks, about the bases of which the fructification grows, clustered from the main stem.

The *Salvinia* of Micheli, referred to *Marsilea* by Linnæus, is now by common consent separated from it. See SALVINIA.

The species of *Marsilea* are,

1. *M. quadrifolia*. Linn. Sp. Pl. 1563. Brown n. 1. (*Lenticula palustris quadrifolia*; Mapp. Alsat. 166. t. 166. *Lens palustris altera*; Camer. Epit. 853.)—Leaflets wedge-shaped, somewhat obovate, rounded, entire; smooth, as well as the footstalks. Fruit shorter than its stalk. Native of various parts of the south of Europe, as well as in New South Wales, in watery places, creeping to a considerable extent. The *footstalks* are from two to six inches long. *Leaves* not unlike those of a Trefoil or *Oxalis*, except in consisting of four leaflets, which are smooth, spotless, and entire, with numerous fine parallel nerves; their base brown or purplish. *Fruit-stalks* either axillary, or united with the bottom of the footstalks, solitary or in pairs, firm, rigid and smooth, half an inch to an inch long. *Involucrum* the size of a small pea, ovate, oblique, with a small point, clothed with shaggy deciduous hairs.

2. *M. hirsuta*. Brown n. 2.—"Leaflets wedge-shaped, somewhat obovate, rounded, nearly entire; hairy, as well as the footstalks. Fruit nearly sessile."—Gathered by Mr. Brown in the tropical part of New Holland, as well as near Port Jackson. We have, from the isles of Mauritius and Bourbon, specimens nearly answering to this definition, inasmuch as their *leaflets* are not quite entire, and are somewhat hairy, as well as their *footstalks*; but the *fruit-stalks* do not differ in proportion from the former, of which we rather suppose these specimens to be a variety.

3. *M. minuta*. Linn. Mant. 308. Syst. Veg. ed. 14. 902. (*M. emarginata*; Delile Ægypt. cum. ic. nondum edit.)—

Leaflets

Leaflets wedge-shaped, deeply toothed at the summit. Fruit roundish, with two teeth at the base. Fruit-stalks rigid, scarcely longer than the fruit.—Native of Egypt. Very much smaller than *M. quadrifolia*, and remarkable for the deep incisions, or teeth of its exactly wedge-shaped leaflets, which resemble some *Medicago* or *Trigonella*. These are paler beneath, and somewhat hairy, as well as their foot-stalks. About four axillary rigid fruit-stalks, very little longer than the fruit itself, and slightly hairy, grow together, more or less combined at their base. The fruit is lateral, or oblique, at the end of each stalk, roundish, compressed, corrugated and hairy, with two teeth at the outermost angle of its base, where the stalk terminates; rounded at the other end, and not pointed there as in the first species. M. Delile has supplied us with a wild specimen from Egypt, under the name of *M. emarginata*, by which this plant is destined to appear in the great work on that country, now publishing at Paris. We find no difference between this specimen and the authentic ones of Linnæus, the native country of which is not marked upon them.

4. *M. coromandeliana*. Burm. Ind. t. 62. f. 2. (*M. minuta* β; Linn. Mant. 308).—Leaflets wedge-shaped, somewhat obovate, nearly entire, smooth. Fruit elliptical, vertical, with two teeth at the base. Fruit-stalks capillary, thrice as long as the fruit. Native of Coromandel and Tranquebar, communicated by the Rev. Dr. Rottler. Nothing can be more distinct than this species from the preceding, with which it is confounded by Linnæus. Possibly the mistake of the learned Swede, and the figure of Burmann, may have led M. Delile to suppose his *emarginata* different from the *minuta*. The present is very much smaller, even than that, with capillary fruit-stalks equal in length to the foot-stalks. The fruit too is essentially different, standing vertically, not laterally, at the end of the stalk, and being elliptical, very strongly corrugated. The leaflets are rounded at the end, and for the most part quite entire. They spread in the form of a cross, as in the other species.

5. *M. angustifolia*. Brown n. 3.—“Leaflets lanceolate, somewhat toothed at the extremity; smooth when full grown.”—Found by Mr. Brown in New Holland, within the tropic. Of this we have seen no specimen.

MARSILLAC, in *Geography*, a town of France, in the department of Allier; 12 miles S. of Montluçon.

MARSILLY, a town of France, in the department of the Marne; 10 miles S. of Sezanne.

MARSOLLIER, JAMES, in *Biography*, a writer of history, born at Paris in 1647, was brought up to the church, and took the habit of a canon-regular of St. Genevieve, and was sent with others to Uzez, to restore order in the chapter of that city. He fixed his abode there, and was elected provost of the cathedral, a dignity which he soon resigned in favour of Poncet, afterwards bishop of Angers, and was then made archdeacon. He died in Uzez, in the seventy-eighth year of his age. His principal works were “L’Histoire du Cardinal Ximenes,” two volumes; “L’Histoire de Henri VII. Roi d’Angleterre;” “Histoire de l’Inquisition et de son Origine;” this, which was first printed in one volume, 12mo., has been since reprinted with considerable additions in two volumes: “Histoire de l’Origine des dixmes et autres Biens temporals de l’Eglise;” “La Vie de St. Francois de Sales;” “Entretiens sur plusieurs Devoirs de la civile;” “Apologie d’Erasme;” this last is an attempt to prove the attachment of Erasmus to the Roman Catholic religion. The style of Marsollier is free and flow-

ing, but not in the best taste; his works are, however, still read with pleasure. Moreri.

MARSOM’S KEY, in *Geography*, a small island in the Spanish Main. N. lat. 12° 5′. W. long. 82° 58′.

MARSON, a town of France, in the department of the Marne, and chief place of a canton, in the district of Chalons-sur-Marne. The place contains 400, and the canton 7608 inhabitants, on a territory of 297½ kilometres, in 18 communes.

MARSTA, a town of Sweden, in the province of Uppland; 16 miles S. of Upsal.—Also, a small island near the W. coast of Sweden, in the North sea, N. lat. 56° 47′. E. long. 12° 31′.

MARSTON MOOR, a place of England, in the county of York, memorable for a battle fought here in 1644, with which commenced the misfortunes of king Charles. The Scottish and parliamentary armies, having joined, laid siege to York, and prince Rupert, reinforced by the duke of Newcastle, determined to raise the siege. Both parties drew up on Marston Moor to the number of 50,000, and victory was long in a state of suspense. Rupert, who commanded the right wing of the royalists, was opposed to Oliver Cromwell, who now first presented himself to notice at the head of a body of troops, disciplined by himself. After a sharp conflict the cavalry of the royalists gave way, and those of the infantry who stood next to them were also put to flight. Cromwell having driven his opponent from the field, returned to a second engagement, which proved equally successful. The prince’s whole train of artillery was taken, and the royalists never afterwards recovered this defeat.

MARSTRAND, one of the most extreme among that cluster of islands, which extends from the coast of Sweden. Marstrand, from its strength called the “Gibraltar of Sweden,” is a rocky island in the Cattigate, about two miles in circumference. The town, which lies on the eastern side, contains 160 houses, and 1200 inhabitants. It was declared a free port in 1776, and was the great resort for the American vessels, which were not permitted to enter into any other port of Sweden. This traffic enriched the town, particularly in 1780 and 1781. Since the peace, the commerce has greatly diminished, and the inhabitants have derived their chief subsistence from the herring fishery, by means of the number of ships which, in bad weather, take refuge in the harbour, and by a contraband trade. Marstrand is called a free port, but the exemption is imaginary: for although all goods are admitted into the town free of duty, yet they cannot be exported without paying the usual customs: and they are subject to a very strict search. The harbour is secure and commodious, but of difficult entrance, and in tempestuous weather dangerous without a pilot. Each of the two entrances is commanded by two new batteries. The place is still further fortified by the strong citadel of Carlstein, which stands on an eminence in the middle of the island. It was built, in 1682, by Charles XI., and taken by the Danes in 1719: but the fortifications have been since considerably strengthened; and it is now deemed impregnable. On the top of the highest tower is a light-house, which commands an extensive view of the Cattigate, sprinkled with an astonishing number of rocks and islands. It is said, that on account of the numerous rocks and shoals, that render this sea dangerous, above 300 vessels have been accustomed to take refuge annually in the harbour of Marstrand. This place has of late very much declined in the number of houses and of inhabitants: 18 miles N.W. of Gotheborg. N. lat. 57° 54′. E. long. 11° 30′.

MARSUIN,

MARSUIN, in *Ichthyology*, a name by which many have called the phocæna, or porpessa, a fish too often confounded with the dolphin.

MARSUPIALE, in *Natural History*, a name given by Tyson to the creature commonly called the possum, or opossum. The peculiar distinction of this creature from all others, is its having a pouch, or marsupium, under its belly, into which it receives its young in time of danger: whence the name.

MARSUPIALIS MUSCULUS, in *Anatomy*, a name given by Cowper, and some others, to a muscle on the thigh, called also by some, bursalis. It is that muscle, called by Albinus, Winflow, and the generality of modern authors, obturator internus.

MARSUPIUM CORNEUM, a name given by Spigelius, Cowper, and some other authors, to certain muscles, of the thigh, called by the French writers, les petits jumeaux, and by Albinus, gemini. Vesalius does not esteem them separate muscles, but calls them only carneæ portiones decimo femur moventium musculo attenæ, fleshy portions affixed to the tenth muscle of the thigh.

Riolan, who calls the pyriformis, or pyramidal muscle of the thigh, the quadrigeminus, or quadrigeminus prior, calls these the quadrigemini secundi & tertii. They are sometimes distinct, sometimes they grow together.

MARSY, FRANÇOIS-MARIE DE, in *Biography*, a modern Latin poet, was born at Paris, and entered at an early period into the society of the Jesuits, where he cultivated his literary talents so successfully, that at the age of twenty he had acquired considerable reputation by his Latin poetry. His chief work in this department was entitled "Pictura," published in 1736. In this poem he passes over the mechanical part of the art of painting, and gives, as it were, a gallery of pictures, several of which are touched with much descriptive force. Some circumstances obliged him to quit the habit of the order, and he employed himself as a man of letters, and composed several useful works, among which were "L'Histoire de Marie Stuart," in three vols.: a translation of "Melville's Memoirs:" "Dictionnaire abrégé de Peinture et d'Architecture:" "L'Histoire Moderne," being intended as a sequel to Rollin's Ancient History: of this he finished eleven volumes, and it was afterwards continued to twenty-six. In 1752 he published "Rabelais moderne, ou les Œuvres de Rabelais mise à la portée de la plupart des Lecteurs," eight vols. He has been much and deservedly blamed for not suppressing the indelicacies and obscenities of the author, as he undertook to abridge him by omitting the obscure and less interesting passages of his works. He was liable to a heavier censure for publishing, in 1754, "L'Analyse de Bayle," in four vols. 12mo., since reprinted in Holland. On account of this Marfy was, for a time, imprisoned in the Bastille. He died in 1763, while employed in writing the 12th vol. of his Modern History.

MARSY, GASPARD, an excellent sculptor, born at Cambray in 1624, where he acquired the principles of his art under his father, and in 1648 he went to Paris to perfect himself. In this journey he was accompanied by his brother Balthazar; they worked together some years, till at length they attracted the notice of M. de la Vrillière, secretary of state, who employed them in the decorations of the hotel de Toulouse. After this they were engaged in the works carrying on at Versailles; their most celebrated performance was a group of tritons watering the horses of the sun in the baths of Apollo. Their last work in conjunction, was the tomb of John Casimir, king of Poland. After this Balthazar laid aside his profession, but Gaspard finished se-

veral other works that did honour to his reputation. In 1657 he was received into the Academy of Painting and Sculpture, was nominated professor in 1659, and chosen rector in 1675. He died in 1681, having survived his brother seven years. Gen. Biog.

MARSYAS, in *Ancient Mythology*, a native of Celænzæ, a town in Phrygia, and son of Hyagnis, who flourished, according to the Oxford Marbles, 1506 years B.C. Marfyas was a famous performer on the flute, of which his father was said to be the inventor. He is represented by Diodorus Siculus (lib. iii. cap. 10.) as a man commendable for his wisdom and temperance. Having engaged in a musical contention with Apollo, he chose the people of Nyssa, at that time the residence of Bacchus or Osiris, for judges. Apollo played at first a simple air upon his instrument; but Marfyas taking up his pipe, struck the audience so much by the novelty of its tone, and the art of his performance, that he seemed to be heard with more pleasure than his rival. Having agreed upon a second trial of skill, it is said that the performance of Apollo, by accompanying the lyre with his voice, was allowed greatly to excel that of Marfyas upon the flute alone. Marfyas, with indignation, protested against the decision of his judges, urging, that he had not been fairly vanquished according to the rules stipulated, because the dispute was concerning the excellence of their several instruments, not their voices; and that it was wholly unjust to employ two arts against one.

Apollo denied that he had taken any unfair advantage of his antagonist, since Marfyas had employed both his mouth and fingers in performing upon his instrument; so that if he was denied the use of his mouth, he would be still more disqualified for the contention. The judges approved of Apollo's reasoning, and ordered a third trial. Marfyas was again vanquished; and Apollo, inflamed by the violence of the dispute, slew him alive for his presumption.

Pausanias relates a circumstance concerning this contest, that had been omitted by Diodorus, which is, that Apollo accepted the challenge from Marfyas, upon condition that the victor should use the vanquished as he pleased.

It is natural to suppose that great provocation had been given on both sides, previous to a trial of skill, big with such serious consequences. And it appears from a passage in Apuleius, that the champions had tried their strength at invective and sarcasm, before the musical contest began. According to this writer, Marfyas was so foolish as to irritate the god, by opposing his own entangled hair, his frightful and shaggy beard, to the flowing locks, the sinical effeminacy, and dainty cleanliness of his rival; for which he was hissed by all the muses and company present.

It is difficult to acquire a true idea of the character of this musician, as some ancient writers, in speaking of him, tell us that he was a man of talents and wisdom, while others represent him as an ignorant clown; just as Polonius, in our Shakspeare's Hamlet, is in some scenes a wise man, and in others an idiot.

Plato tells us that we are indebted to Marfyas and Olympus for wind-music; and to these two musicians is likewise attributed the invention of the Phrygian and Lydian measure. Marfyas is also said by some to have been the inventor of the double flute, though others give it to his father Hyagnis.

Antiquity has furnished us with several monuments of the punishment inflicted upon him by Apollo. He may be seen in Berger, in Massei, and in Du Choul. The story is likewise well and fully represented in one of the ancient pictures dug out of Herculaneum. Here the vanquished musician is bound to a tree, the executioner standing by with a

knife in his hand, only waits for orders from the victor to flay him alive. Apollo is seated at a distance, with a lyre in one hand, and a plectrum in the other, and a muse by his side, preparing a garland for him in token of victory. A young man, on his knees, appears to implore his mercy; this is thought to be Olympus, the scholar of Marfyas, asking pardon for his master, or, perhaps permission to give him funeral obsequies, which, as we learn from Hyginus, he obtained.

And Diodorus informs us, that Apollo, soon repenting of the cruelty with which he had treated Marfyas, broke the strings of the lyre, and by that means put a stop, for a time, to any further progress in the practice of that instrument.

MART, denotes a great fair or market, for selling of goods, holden every year. See FAIR and MARKET.

MART, *Letters of*. See LETTERS and MARQUE.

MARTA, in *Geography*, a town in the duchy of Castro, on a river of the same name, where it issues from the lake of Bolsena; 11 miles E. of Castro.

MARTA, or *Martena*, a town of Hindooftan, on the coast of Malabar; 10 miles S. of Cochin.

MARTA, *St.*, a branch of the *Andes*; which see.

MARTA, *Santa*, or *St. Martha*, a province of South America, in the viceroyalty of New Granada, bounded on the N. by the Spanish Main, on the E. by Rio de la Hacha and Maracaibo, on the S. by Santa Fé, and on the W. by Carthagena. This is a mountainous and very high country, extending in length about 300 miles, and in breadth about 200. The climate is hot and sultry, but the heat is mitigated by the winds which blow over the mountains covered with snow. The chief town is

MARTA, *Santa*, or *St. Mariba*, which is a sea-port on the Spanish Main, founded in 1555; with a good haven defended by two forts, but of late considerably declined; the houses being now mostly constructed of wood and covered with straw. This was the place of arms of Quesada, the conqueror of New Granada; and was reduced to ashes, in 1596, by Sir Francis Drake. It is now a bishop's see. The port is large and convenient, protected by lofty ridges, and has in front a round hill, which defends the city on the side of the snowy mountains, at the distance of three leagues. These mountains may be regarded as the termination of the main chain of the *Andes*; which see. The climate is less hot and more healthy than that of Carthagena; and the city is supplied with excellent water from the river Goegaira, or Guayra, which passes near it: the banks of the river being covered with beautiful groves of trees, and among others, some whose leaves bear an unctuous appearance, and are used as soap. The environs produce cotton, tobacco, some wine, cacao, Brazil wood, sugar, vanilla, and some wheat. Here is also abundance of cattle, and some mules are bred. The population of Santa Marta is not ascertained. At Carrizal, on the S. of Cape Vela, 16 leagues E. of the city of Santa Marta, there is a pearl fishery, which, under bad conduct, yields only about 30,000 dollars. At Oceana there are copper mines, and gold mines near the river Ariguana, 30 leagues from the city. Ornaments of tombac have been found in the tombs of the Indians. Estella, who has given a minute and interesting description of this province, says, that it only contains betwixt 25 and 30,000 souls, the population of a mere European town; 100 miles N.E. of Carthagena. N. lat. 11° 16' 2". W. long. 74° 4' 30". See NEW GRANADA.

MARTABAN, a sea-port town in a province of the same name, in the Birman empire. It was formerly a port of considerable eminence; but it has lost its distinguishing

importance by the plunder and devastation of the Peguers and Siamefe, and by the obstruction of the navigation into its harbour, occasioned by ships that were sunk in the river by order of the Birman sovereigns. N. lat. 16° 38'. E. long. 98° 2'. See ARRACAN, AVA, *BIRMAN Empire*, PEGU, and SIAM.

MARTAGO, a town of Spain, in the province of Leon; 10 miles S.S.E. of Ciudad Rodrigo.

MARTAGON, in *Botany*, a name given to several species of lily.

MARTANO, in *Geography*, a town of Naples, in the province of Otranto; 10 miles N.W. of Otranto.

MARTAWAN, a village of Syria, that lies on the road from Alexandretta to Aleppo, celebrated among the Turks and Europeans, on account of an extraordinary practice of the inhabitants, who let out their wives and daughters for a trifling sum. "This prostitution, held in abhorrence by the Arabs, seems to raze," says Volney, (*Trav. in Egypt*, &c. vol. ii.) "to have originated in some religious custom, which ought perhaps to be fought for in the ancient worship of the goddess Venus, or to be attributed to the community of women permitted by the Anfarians, to which tribe the inhabitants of Martawan belong."

MARTEAU, in *Conchology*, the name given by French naturalists to a peculiar species of oyster, called also *malleum* by others. It is one of the most curious shells in the world. Its figure is that of a hammer, with a very long head, or rather of a pick-ax. It has a body of moderate thickness, and two long arms. It is of a brownish colour, with a beautiful tinge of a violet-blue. Notwithstanding the strange shape of these shells, they close very exactly.

MARTEAU, in *Ichthyology*. See SQUALUS *Zygana*.

MARTEL, in *Geography*, a town of France, in the department of the Lot, and chief place of a canton, in the district of Gourdon; 29 miles N. of Cahors. The place contains 2711, and the canton 9952 inhabitants, on a territory of 187½ kilometres, in 14 communes.

MARTELLI, LODOVICO, in *Biography*, was born at Florence in 1409, and became distinguished by his poetical genius, and, but for an early death, would have had a high rank among the literary characters of his age and country. He was author of many verses, as well in the burlesque as in the serious style; but is chiefly known for a tragedy, entitled "Tullia," which is much esteemed among the early productions of the Italian drama. He had a brother, Vincenzo, who was patronized by the prince of Salerno. On some account he was thrown into prison; on which occasion he made a vow to undertake a pilgrimage to Jerusalem, should he regain his liberty. This event took place; and he finally retired to a tranquil life, and died in 1556. A volume of his poems and letters was published in 1607; many of his letters also are to be met with in the collection of letters of illustrious men, published at Venice in 1564.

MARTELLI, PIETRO-JACOPO, an eminent Italian poet, born at Bologna in 1665, was educated first at the Jesuits' school, and afterwards at the university of his native city. His father would willingly have brought him up to the profession of physic; but the young man could not endure the practice, and was permitted to devote himself to the study of classical literature. When he was about thirty-two years of age, he obtained the post of one of the secretaries to the senate of Bologna. He published a serious poem, entitled "Gli Ocche di Gesu," *the Eyes of Jesus*. He next applied himself to tragedy, and having carefully perused the Greek and the French tragedians, he published "La Morte di Nerone." This and several of his other pieces were acted upon

upon different theatres, with great applause. In 1707 he was appointed professor of the belles lettres in the university of Bologna, and soon after was made private secretary to Aldrovandi, who had been nominated delegate to pope Clement XI. At Rome he contracted an intimacy with many men of high literary reputation, and was the means of renewing the assemblies of the academy of Arcadi. He published about this period several tragedies, and a singular dialogue, "Del Volo," *On Flying*, in which he endeavoured to prove that men and heavy bodies might be supported in the air; and in the same work he gave a description of a flying ship, which he projected. He also wrote several discourses in verse concerning the art of poetry. He next went to Paris with Aldrovandi, who was appointed the pope's legate at the courts of France and Spain, and became acquainted with the most distinguished men of letters, at whose request he stated at length his opinions "On ancient and modern Tragedy," in the form of dialogues, which were published by his friends before he had revised them for the press. On his return to Rome, in the course of nine months, he published his tragedies in three volumes, and was reckoned to have conferred, by the work, a great benefit on Italian literature, by reviving a true taste for this species of composition. In 1716 he was diligently occupied at Rome with a dispute between the cities of Bologna and Ferrara, concerning the derivation of the waters of the Reno and Po. His zeal in this business caused him, in 1718, to be promoted to the vacant place of first secretary to the senate. He wrote several other pieces besides those that have been referred to, and began a poem "On the Arrival of Charlemagne in Italy, and his Accession to the western Empire," which he never finished. He died in 1727, at the age of sixty-two. As a man, he was beloved for the suavity of his manners and his social qualities. As a poet, he was elevated and splendid rather than easy and natural, and a great admirer of his own productions. His principal works in prose and verse were printed in nine volumes, 8vo., in the year 1729. Gen. Biog.

MARTELLIERE, PETER DE LE, who rendered his name celebrated as an advocate at the French bar, was the son of a lieutenant-general. He came to Tours at the time that the parliament of Paris held its sittings there, and entering himself at the bar, followed the profession of a pleader during forty-five years, with a celebrity that placed him among the most eminent advocates of his time. In 1611 he pleaded the cause of the university of Paris against the Jesuits, and pronounced a most bitter philippic on the society, which was much admired as well in print as on the delivery. It went through several editions, and was answered by some person on the part of the society. Martelliere was afterwards created a counsellor of state. He died in 1631. He is styled, in his epitaph, "Princeps Patronorum, et Patronus Principum." Moreri.

MARTELLO, CAPE, in *Geography*, the south point of the island of Negropont. N. lat. 38°. E. long. 24° 39'.

MARTENNE, EDMUND, in *Biography*, a learned French Benedictine monk, was born in the year 1654. At the age of eighteen he took the vows in the abbey of St. Remi at Rheims, where he was greatly distinguished among his contemporaries by the diligence of his application, and his profound laborious researches. As an author he first appeared in 1690, with a work, entitled "Commentarius in Regulam sancti Benedicti literalis, moralis, historicus," which is a compilation of what the best writers have said on the subject, and contains dissertations on different questions, which display the erudition of the author. He published "De antiquis Monachorum Ritibus," in two volumes, 4to.,

which furnishes much curious matter, illustrative of ancient ecclesiastical and profane history. From this period he was frequently before the public by works of various merit; but his fame with posterity is chiefly secured by the part which he took in new-modelling the work, entitled "Gallia Christiana." To enable him to do this, it was determined that he should visit the public archives, and the libraries of the churches and monuments throughout the kingdom, to search for such documents as had escaped the knowledge and investigation of the original authors. On this literary mission he set out, and traversed, alone, Poitou, Berry, Nivernois, and part of Burgundy. He spent six years in these travels, the result of which was a rich harvest of materials, which, exclusive of more than two thousand pieces illustrative of the "Gallia Christiana," compose the greater part of five volumes in folio, published in 1717, under the title of "Theaurus novus Anecdotorum," &c. In the same year he published, conjointly with his fellow-labourer, D. Ursin Durand, a particular account of their journey, entitled "Literary Travels of two Monks of the Congregation of St. Maur." Two years after, they took another journey by order of their superiors, and published an account of it, under the same title with the preceding. The result of this second journey was an immense collection of documents, in nine volumes, folio, under the title of "Veterum Scriptorum et Monumentorum Historicorum, et Dogmaticorum amplissima Collectio;" of these the first three appeared in 1724, and the six last in 1733. He was concerned in many other publications, particularly in father Mabillon's sixth volume of his "Annales Ordinis S. Benedicti;" and in the new edition of father d'Achéry's "Spicilegium." He died in 1739, at the great age of eighty-five. He was respected and beloved by his literary contemporaries, as well on account of the simplicity of his manners as of the vast extent of his learning, and his indefatigable industry. Moreri.

MARTENS, THIERRY, in Latin, *Martinus*, a native of Alost, in Flanders, celebrated as the person who first introduced the art of printing into the Netherlands; having exercised this useful and noble art nearly sixty years at Alost, Louvain, and Antwerp. He died at the last-named place in 1553, at the age of four-score. He was an author as well as a printer; but it is said his own productions were the least valuable of those that issued from his press. He was highly esteemed by the learned men of the period in which he lived, and enjoyed the friendship of Erasmus, who lodged in his house. He employed the double anchor as a sign of the books that were printed at his office. Gen. Biog.

MARTHA BRAE, in *Geography*, a harbour and village in Jamaica. N. lat. 18° 31'. W. long. 77° 32'. See FALMOUTH.

MARTHA, *St.* See *Santa MARTA*.

MARTHA, *St.*, *Bay*, a bay on the W. coast of the island of Curaçoa.

MARTHA'S *Vineyard*, an island in the Atlantic, near the coast of New England, belonging to Duke's county, Massachusetts, called by the Indians "Nope," or "Capawock," lying between 40° 17' and 41° 29' N. lat., and between 70° 22' and 70° 50' W. long. W. of Nantucket; about 21 miles in length, and six in breadth.

Martha's Vineyard, Chabaquiddick, Noman's island, and the Elizabeth islands, which contain about 16,500 acres of valuable land, constitute Duke's county, containing 3118 white inhabitants, and between 400 and 500 Indians and mulattoes; who subsist by agriculture and fishing. Cattle and sheep are raised here in great numbers; and rye, corn,

and oats are the chief produce of the island. White pipe-clay and yellow and red ochre are found in Martha's Vineyard.

MARTHALON, a town of Switzerland, in the canton of Zurich; 5 miles S. of Schaffhausen.

MARTIAGO, a town of Spain, in the province of Leon; 10 miles S. of Ciudad Rodrigo.

MARTIAL, or **MARTIALIS**, **MARCUS VALERIUS**, in *Biography*, a native of Bilbilis, in Spain, where he was educated, and remained till he had arrived at man's estate, when he came to Rome. He was sent thither to study the law, but he was too much addicted to poetry to settle to a profession that requires great labour and severe study. His fine talents and taste for polite literature ingratiated him with the principal literary characters then in Rome, and even procured for him imperial patronage. Flattered with the notice taken of him, he became the panegyrist of the emperors, and in his turn gained the greatest honours, and was rewarded in the most liberal manner. Domitian gave him the tribuneship, but the poet, unmindful of the favours which he had received, after the death of his benefactor, exposed to ridicule the vices and cruelties of a monster, whom, in his lifetime, he had extolled as the pattern of virtue, goodness, and excellence. Trajan treated the poet with coldness; and Martial, after he had passed thirty-five years in the capital of the world, in the greatest splendour and affluence, retired to his native country, where he had the mortification to be the object of malevolence, satire, and ridicule. He received some favours from his friends, and his poverty was alleviated by the liberality of Pliny the younger, whom he had immortalized in his poems. Martial died in the 104th year of the Christian era, and in the 75th year of his age. He is unquestionably the most eminent of the epigrammatists, and is looked to as the sole model of that species of composition. He wrote fourteen books of epigrams, which are described by himself as "some good, some middling, and more bad;"

"Sunt bona, sunt quædam mediocria, sunt mala plura:"

this is thought by the best judges of compositions of the kind as sufficiently modest. The licentiousness of many of his epigrams deserves the strongest censure: the poet has in many instances shewn himself a declared enemy to decency, and the book is to be read by young persons with the utmost caution, as its tendency is often to corrupt the purity of morals, and initiate the votaries of virtue into the mysteries of vice. The best editions of Martial are those of Paris 1617, folio; Seriverii, 12mo. Lug. Bat. 1619; Schrevelii, 8vo. 1670. There are, as there ought to be, several calligraphed editions and selections for the use of schools.

MARTIAL, St., in *Geography*, a town of New Mexico, in the province of Sonora; 48 miles S. of Pitquin.

MARTIAL is sometimes used to express preparations of iron, or such as are impregnated therewith; as the martial regulus of antimony, &c.

MARTIAL, Court. See *Court-Martial*.

MARTIAL Law, is the law of war, depending upon the arbitrary, but just power and pleasure of the king, or his lieutenants. The king, though in times of peace he makes no laws but by the consent of his parliament; yet, in war, uses absolute power over the soldiery; though even this power hath been vested, of late years, in the king, or his generals of the army, by act of parliament, and under particular restrictions too.

Martial law, says sir Matthew Hale, is in reality no law, but something indulged rather than allowed as law. The necessity of order and discipline in an army is the only thing

that can give it countenance; and therefore it ought not to be permitted in time of peace, when the king's courts are open for all persons to receive justice according to the laws of the land. The petition of *right* (which see) enacts that no soldier shall be quartered on the subject without his own consent; and that no commission shall issue to proceed within this land according to martial law. See *Martial Court*.

MARTIALES FLORES. See *FLORES Martiales*.

MARTIANAY, JOHN, in *Biography*, a learned French Benedictine monk, was born at St. Sever, in Gascony, in the year 1647. Having entered into the order at Toulouse, in 1668 he applied with great diligence to the study of the Greek and Hebrew languages, with the view of obtaining a critical acquaintance with the sacred scriptures. When he had attained to that degree of competency in the pursuit which gave him confidence in his own powers, he perfected himself by reading lectures in different monasteries belonging to his order, and spent a considerable part of his life in endeavouring to illustrate them by various and very erudite publications. He was engaged jointly with father Pougé, in publishing a new edition of the works of St. Jerome, in five vols. folio, after which he gave the world a life of the faint. He was likewise author of "Historical Treatises on the Truth of the Inspiration of the Sacred Books;" a treatise "On the Canon of the Books of Scripture;" of one "On the Manner of explaining the Sacred Scripture;" he published also the "New Testament, with Notes taken entirely from the Scripture," and of a "Commentary on the Whole of the Scriptures." He died in 1717, about the age of seventy. Moreri.

MARTIANO, in *Geography*, a town of France, in the department of the Tanaro; 12 miles S.E. of Aiti.

MARTIANUS CAPELLA. See *CAPELLA, MARTIANUS*.

MARTICHORA, in *Natural History*, the name given by the ancient Greeks to the animal which we call the mantichora, or man-tiger.

MARTICK, in *Geography*, a township of America, in Lancaster county, Pennsylvania, having 1248 inhabitants.

MARTIGAO, a town of Portugal, in the province of Beira; 21 miles N.E. of Coimbra.

MARTIGNANA, a town of France, in the department of the Stura, near the Po; five miles W. of Saluzzo.

MARTIGNANO, a town of Italy, in the Trevisan; seven miles N.W. of Trevigio.

MARTIGNE', a town of France, in the department of the Ille and Vilaine; eight miles S.S.W. of La Guerche.—Also, a town in the department of the Mayenne; seven miles N.N.W. of Laval.

MARTIGNÉ Briand, a town of France, in the department of the Mayne and Loire; 15 miles S. of Angers.

MARTIGNÉ la Comte, a town of France, in the department of the Saône and Loire; 6 miles N. of Charolles.

MARTIGNY, which, according to antiquaries, was the ancient *Ostodarum*, a village of Switzerland, in the Vallais, situated on a small plain, encircled by high mountains, and divided by the Dranse, that falls into the Rhone. This is a place much frequented by travellers; it leads to the Valley of Chamouny, to St. Maurice, and the lake of Geneva, and is the passage of the merchandize which is conveyed over the great St. Bernard into Italy. Near Martigny, are the majestic ruins of Le Bathin, an old episcopal castle, crowning the summit of a craggy rock, and impending over the impetuous Dranse.

MARTIGUES, LES, a town of France, in the department of the Mouths of the Rhone, and chief place of a canton, in the district of Aix; situated on an island at the mouth

mouth of a lake, to which it gives name, near the sea; the lake is near 20 miles long, and 12 broad; 14 miles S.S.W. of Salon. The place contains 7079, and the canton 10,947 inhabitants, on a territory of 297½ kilometres, in six communes.

MARTIN, BERNARD, in *Biography*, was born at Dijon, in 1574. He was educated for the profession of the law, and was admitted an advocate in the parliament of Burgundy, where he distinguished himself by the erudition and eloquence of his pleadings. In 1605 he was called to the capital on an affair of some consequence. Here he published the result of several years critical researches into different ancient authors, under the title of *Bernardi Martini Variarum Lectionum*, lib. iv. After this he applied himself solely to his professional studies, and made large collections for a commentary on the custom of Burgundy, which he had just put to the press when he died in 1630. Moreri.

MARTIN, faint, was born at Sabaria, in Pannonia, now denominated Hungary, about the year 316. He served in the army some years, but being converted to Christianity he embraced a religious life, and was the means of converting his mother from the pagan doctrines. In 374 he had obtained such a reputation in the church that he was appointed bishop of Tours, but his elevation to this high dignity did not lead him to banish the original simplicity, and even austerity of the monk. He erected the monastery of Marmontier, and is considered as the apostle of the Gauls. He died in the year 397. Under his name there is extant a confession of faith on the doctrine of the Trinity.

MARTIN L., pope, who obtained likewise the honour of the titles of saint and martyr in the Romish church, was a native of Todi in Umbria, became presbyter of the church of Rome, in 649, and was elected to the papal throne on the death of Theodore. It is not our business, in this place, to enter at large into the contests which agitated the church at this period; they relate chiefly to the number of wills and operations in Christ, one party maintaining the doctrine of one will and one operation, and the other, that of two wills and two operations. See MONOTHELITES.

As soon as Martin had taken possession of his see, he directed a council of bishops to be assembled at Rome, who met at Rome to the number of one hundred and five. The debates were violent and protracted through five sessions, when by the influence of the pope it was decreed that the doctrine of two wills was the true Catholic doctrine, and that, of one will, plainly heretical. Martin next endeavoured to conciliate the emperor, and by a most submissive and flattering letter, endeavoured to convince him that the doctrine of one will was repugnant to the decrees of the councils, to the doctrine of the fathers, and to the belief of the church; and that therefore it had been of necessity condemned. Constantine was not, however, so easily won over; he was enraged at the conduct of the pope, and determined to revenge the insult offered to the imperial laws, and without hesitation ordered the exarch of Italy, at all events, to seize and depose Martin, and to send him away prisoner. The officer performed the duty enjoined upon him with the utmost promptitude. The pope, notwithstanding the remonstrances of the clergy, who offered to vindicate his authority, and to stand by him to the last, surrendered to the civil power, and was carried privately, with a few domestics, on board a vessel in the Tyber, which was immediately dispatched to the East. During a tedious voyage of three months, they touched at different places, at which the pope was not permitted to go on shore, notwithstanding his sufferings from sea-sickness, the gout, and other distressing maladies. He was, moreover, cruelly deprived of such comforts and refreshments as were brought

to him by the clergy and others, who were driven away, and sometimes grossly insulted as enemies of the state, and rebels to the emperor. When he had arrived at the island of Naxos, in the Archipelago, he was confined there a whole year, and then ordered to be brought to Constantinople, where he arrived in the autumn of 654. Here he was closely imprisoned and severely maltreated for more than three months. He was at length brought to trial on a charge of high treason, of which he was found guilty, without much regard to the nature of the evidence adduced; the verdict was however no sooner delivered than the high treasurer, who presided as judge, ordered the guards to strip him, and the people to anathematize him; he was then delivered to the governor of Constantinople, who directed an iron collar to be put about his neck, and to have him dragged through the streets of the city, loaded with chains, and then shut up in prison, till he should be led out to execution. Here he was treated with great barbarity, and would probably have died under his sufferings, had not the emperor been persuaded to spare his life. He accordingly banished him to the Sarmatian Chersonesus, where he arrived in the spring of 655. In this inhospitable country, and in the midst of a pagan people, he had the mortification of finding himself entirely neglected by his friends in Italy, and suffered even to want the common necessaries of life. He died in the following September. There are still extant seventeen of his "Letters," in the fifteenth volume of the *Collect. Conciliorum*, which are said to exhibit superior talents and an enlarged mind. Bower.

MARTIN II., pope, sometimes called Marinus I., the son of a presbyter, and a native of Galleium in Tuscany, recommended himself to different popes by his great talents for business, and thus he rose to the dignity of archdeacon of the Roman church. In 866 he was deputed by pope Nicholas to Bulgaria and Constantinople, for the purpose of excommunicating the patriarch Photius; and again in 869 by pope Adrian II. to sit in the general council convened in opposition to that patriarch. Ten years afterwards he was sent legate to Constantinople, a third time, by pope John VIII. to renew the act of excommunication. By the last named pontiff he was probably ordained bishop, but without a see. Upon the death of John, in 882, he was elected his successor; and Platina says that he was indebted for his elevation to wicked practices, of which there is certainly no mention made by any of the more ancient writers. One of the first measures of his administration was to declare the acts of the late council of Constantinople null and void, and to anathematize all who should communicate with Photius, or acknowledge him as lawful patriarch. These proceedings gave so great offence to the emperor Basilius, that he would not own him for lawful pope. Another measure of pope Martin's government, was his restoration of Formosus, bishop of Porto, to his see, though he had been repeatedly excommunicated by his predecessors, and even obliged to swear that he would never resume the episcopal functions. Martin absolved him from the obligation of his oath, declaring him innocent of the crimes laid to his charge, and replaced him in his bishopric. Nothing more of moment is recorded of this pontiff. He died before he had presided over the holy see eighteen months. We have remaining of his works "A Constitution for the Benedictine Monastery in the Diocese of Limoges," which may be found in the ninth vol. of the *Collect. Concil.* Bower.

MARTIN III., pope, sometimes known by the name of Marinus II., probably a Roman by birth, succeeded to the papal dignity on the death of the eighth, or, as others affirm, the ninth Stephen, in the year 942. Little is known of this pope, except that he was too much attached to the system of monkery,

monkery, and granted very extraordinary privileges and exemptions to what were called religious men and houses. He died in 946, after a pontificate of about three years and a half. He was a great friend to the poor, and was liberal in building, repairing, and adorning churches; and is deservedly praised for his endeavouring to reconcile the Christian princes who were engaged in bloody wars. Bower.

MARTIN IV., pope, whose original name was Simon de Brie, or de Brion, was descended from an illustrious family, and born at Montpensier, in the Touraine. He many years held distinguished offices in the church, and in 1260 was appointed keeper of the seals to Lewis IX.: in the following year he was created cardinal by pope Urban IV., after which he sustained the character of papal legate in France, both under that pope, and under Gregory X. After the death of Nicholas III., and when the Roman see had been vacant more than six months, he was elected to fill it in February 1281, and upon his promotion to this high honour he assumed the name of Martin, avowedly in honour of St. Martin of Tours, of which church he had been canon. From the moment of his accession, his whole attention was directed to the promotion of the Roman hierarchy. With the design of favouring the views of Charles, king of Sicily, on the Greek empire, and the city of Constantinople, and with the view of rendering the influence of the papal see triumphant in the East, he communicated the emperor Michael Palæologus, under a very slight and flimsy pretext, of his having broken the peace which had been concluded between the Greek and Latin churches, at the council of Lyons, in the pontificate of Gregory X. This design was entirely defeated by the famous conspiracy known by the name of the SICILIAN *Vespers*, (which see,) by which all the French in the island were butchered, and the revolution effected that seated Peter, king of Arragon, on the throne of Sicily. The pope immediately thundered out the most dreadful anathemas against all the persons concerned in this atrocious deed, and when Peter landed in the island, and was crowned king, he wrote several threatening letters to him, demanding that he should instantly resign his pretensions, and withdraw from a country which belonged to the apostolical see, upon pain of excommunication, and the forfeiture of his own kingdom. The king set his holiness at defiance, and avowed his determination to keep possession of Sicily, as the inheritance of his wife, and he was readily obeyed by the clergy in both his kingdoms, whom he commanded to continue in the regular exercise of their functions, notwithstanding the interdict. Irritated at Peter's resistance, the pope, by a bull, deprived him of the kingdom of Arragon, and his other dominions in Spain, which he declared to be forfeited, and that they should be the property of any prince who would seize them. In derision of the pope's pretended power to deprive him of the regal title, the king of Arragon styled himself "Peter, a gentleman of Arragon, the father of two kings, and lord of the sea." Martin, anxious for revenge, offered the dominions of Peter to Philip of France, and to assist him in the seizure, his holiness granted him the tenth of the ecclesiastical revenues, and encouraged his subjects to flock to his banner, by granting indulgences to all who should engage in that holy war. While he was meditating other projects, as well for the humiliation of the rebellious monarch as for the glory of the Roman hierarchy, he was cut off by a sudden death in 1285, after a pontificate of four years. There are five of his "Letters," and the sentence which he pronounced against Peter of Arragon, in the 11th vol. of the *Collect. Conciliorum*. Besides these, there are thirteen of his letters in

Wadding's *Annals*, and in the appendix to this work. Moreri. Bower.

MARTIN V., pope, whose former name was Otho, or Eudes Columna or Colonna, was a descendant from a branch of an ancient and well-known family of that name. He studied canon law at Perugia, and was created prothonotary and referendary by pope Urban VI. He was appointed nuncio to the Italian states by Boniface IX., and raised to the purple by Innocent VII. He adhered to the interests of Gregory XII. till he was deposed by the council of Pisa. He was appointed apostolical legate for the patrimony of St. Peter, and vicar general of the apostolical see in Umbria; in which employments he gave the most perfect satisfaction to his employers. Upon the deposition of pope John by the council of Constance, in 1417, he was elected to the papal dignity, and took the name of Martin V. On his coronation he was conducted on horseback through the city in pontifical attire, by the emperor on foot, holding his bridle, on the right hand, and the elector of Brandenburg on the left, and followed by a crowd of princes and the whole council. After dissolving the council of Constance, in the year 1418, Martin set out on his return to Italy, with the view of endeavouring to terminate the civil war in which the city of Rome and the whole patrimony of St. Peter had been some time involved. In his progress he spent some time at Geneva, where he received the ambassadors of the city of Avignon, and from that city he dispatched a legate into Bohemia, who made a fruitless effort to quell the disturbances in that kingdom, which had been excited by the denial of the cup in the sacrament to the laity, and the execution of Huss and Jerome of Prague. Martin next went to Milan, where he was received with extraordinary marks of honour. After this he visited Mantua, Ferrara, Ravenna, and came to Florence in the beginning of the year 1419. Here he continued about two years, which were spent in reducing the tyrants who had seized the cities in the ecclesiastical state, or such places as had revolted against the papal authority. In a short time after, he had the satisfaction of seeing Balthazar Cosca, formerly John XXIII., throwing himself on his mercy, and his submission was followed by a splendid embassy from Joan II., queen of Naples, to do him homage in her name, and to request that his holiness would send a legate to perform the ceremony of her coronation. Immediately after this ceremony, Joan caused all the places which her predecessor Ladislaus had seized in the ecclesiastical state to be restored, and also sent James Sforza, a soldier of fortune, with the flower of her army, against Braccio of Perugia, who had made himself master of many cities belonging to the church, and of Rome itself, which he governed under the title of "Defender of the City of Rome." Sforza was defeated, and pursued with great slaughter to the borders of the kingdom of Naples. The pope instantly excommunicated the conqueror, who, to shew his contempt for such kind of hostility, in his turn excommunicated the pope and all who adhered to him. Through the mediation of the Florentines, an agreement was soon concluded between Braccio and the pope, the former consenting to deliver up Rome, and some other cities to the pope. Martin resolved to go to Rome, which he entered in September, 1420, and was received with the loudest acclamations of joy by the clergy, the senate, and the people, who hailed his approach as their deliverance from absolute destruction. At this period, the city was but little better than a heap of ruins, and the inhabitants almost starving. To remedy these evils, Martin applied himself with the utmost zeal and vigour, and in less than two years he acquired the title of Romulus II., by his exertions

to promote order and regularity, and to restore the city to its ancient splendour and beauty. In the mean time Peter de Luna, under the name of Benedict XIII., continued to act the part of sovereign pontiff, and at his death, in 1424, Giles de Munion was elected his successor, by the name of Clement VIII., who was supported by Alphonso of Naples. When Martin sent a legate to this prince, in 1426, to remonstrate with him on his being the only Christian prince who upheld the schism in the church, Alphonso prohibited the legate from entering his dominions, and likewise forbade the bishops, and other ecclesiastics, to receive any letters from the pope on pain of forfeiting their dignities and revenues. Alphonso, after this, was glad to come to an accommodation with his holiness, which, after protracted negotiations, was effected in the year 1429. It was agreed that the anti-pope and his cardinals should resign their dignity, submit to Martin, receive absolution from the legate, and be provided for with considerable benefices. Thus terminated the schism, known by the name of the "Great Western Schism," after it had lasted more than half a century. Martin was now left without a rival, and he immediately turned his attention to promote crusades against the Hussites of Bohemia. He died of a stroke of apoplexy in 1431, having been at the head of the church more than thirteen years. Martin was a decided enemy to reformation in the church, and disposed, generally, of lucrative employments to his relations, in preference to all others, however deserving. Fifteen of his "Letters," "Bulls," and "Constitutions," are to be met with in the twelfth volume of father Labbe's *Concil. Maxim.* Others are also to be found in "Bzovii Annal." and in the first volume of Laetius Cherubini's "Magnum Bullarium," &c. Bower.

MARTIN, a Catholic prelate in the sixth century, was by birth a Pannonian, or Hungarian, who quitted his native country when he was very young, and travelled into the East, for the purpose of visiting Jerusalem and the holy places. From Palestine he went into Spain, where he converted great numbers of people to what was called the Christian faith, and founded many monasteries. He was present at the second council of Braga, in 563, and presided at the third council in the year 572. He died in 572, and left behind him many very learned works, of which the most important is entitled "Collectio Canonum Orientalium," consisting of eighty-five canons of the Greek church, translated into Latin by himself. They are to be met with in all the collections of the councils, and in them the pretended "Apostolical Constitutions" are never cited. Moreri.

MARTIN, BENJAMIN, a celebrated optician and experimental philosopher, was born in the year 1704. He was the son of a farmer, and became in early life a school-master at Chichester, where he wrote some excellent books on mathematical subjects. The profits of his profession probably enabled him to procure, by degrees, a good apparatus of philosophical instruments, with which he commenced lecturer in experimental philosophy, and travelled for some time in that character through different parts of the kingdom. He next appeared in the same profession in London, and delivered his courses to crowded audiences for many years. He finally settled in Fleet-street, London, as an optician, and made several important improvements on mathematical and philosophical instruments. The growing infirmities of age, obliged him to quit the active part of his business, and, trusting too much to others, his affairs became embarrassed, and he was made a bankrupt, though it was found his effects were more than sufficient to discharge all his debts. His mind was not equal to the shocks of adversity, and in the moment of despondency he attempted to destroy himself.

He did not succeed in the effort, but the wound which he inflicted hastened his death, which took place in 1782, when he had attained the age of seventy-eight. His works are numerous, and were exceedingly valuable at the time of their publication. Some of them retained a large share of popularity till within the last twenty years, particularly his "Philosophical Grammar;" "The young Trigonometer's Complete Guide," in two vols. octavo; "The Philosophia Britannica," or "System of the Newtonian Philosophy," in three vols. octavo. He had, during his long life, formed a capital collection of fossils and other curiosities, which were sold after his death. "As an artist," says his biographer, "he was industrious and ingenious; and, as a writer, he possessed the happy method of explaining his subject; he wrote with perspicuity and even elegance."

MARTIN, DAVID, a French Protestant divine in the 17th and the early part of the 18th centuries, was born at Revel, in the diocese of Lavaur, in the year 1639. Having passed through his academic studies with credit and applause, he was admitted M. A. and doctor of philosophy in the year 1659. After this, he applied himself to the study of divinity; to that of the sacred scriptures, the oriental languages, ecclesiastical history, and the different branches of profane as well as sacred literature. In 1663, he settled as pastor, and officiated in the ministry till the revocation of the edict of Nantes in 1685. After this, and the demolition of his place of worship, it being discovered that he still maintained a private connection with his church, he narrowly escaped an arrest, and withdrew to Holland. In 1686, he was invited to become professor of divinity, and pastor of the Walloon church in Deventer; but the regency of Utrecht, where he had taken up his residence, prevailed upon him to accept the office of pastor in their city. He afterwards received invitations from several other churches, both in the republic and abroad, and particularly from that of the Hague, which he declined. He now employed himself in giving lectures in philosophy and divinity, and acquired so high a reputation by his successful manner of instructing his pupils, that young persons of high rank, and even the sons of sovereign princes, were placed under his tuition. He had deeply studied the nature and genius of his own language, and when the French academy was about to publish the second edition of their Dictionary, he sent them remarks and observations, of which they availed themselves, with polite acknowledgments to the author. He died in 1731, having completed his eighty-second year. He was author of many learned works, among which is an edition of "The New Testament, according to the Geneva Version, with Corrections, Notes, New Prefaces, &c.;" "A History of the Old and New Testament," in two vols. folio, embellished with upwards of 400 engravings; "A Treatise on Natural Religion;" and one on "Revealed Religion," in two volumes octavo. This was his last work, the second edition of which bears the date 1720. Moreri.

MARTIN, CLAUDE, an officer in the British military service in India, was by birth a Frenchman, of rather a mean descent. He had sufficient interest to get a good mathematical education at a public school, and at the age of 20 entered into the army. His regiment was sent to India with general Lally, and, in the war of 1756, he behaved with great gallantry, but being ill-treated, he enlisted into the English service, in which he rose to the rank of colonel. Being employed to make a map of the cities of the nabob of Oude, he recommended himself to his patronage. Martin was enabled, under the protection of the nabob, to open a profitable bank, and to embark in other commercial speculations, by which he gained a deal of wealth. At Lucknow

he built a curious mansion in a style of his own, in which he could enjoy all the mildness and coolness of an European climate with the fervour of the Asiatic. He erected another of the same kind on the banks of the Ganges, which he fortified in the European manner. He formed a large museum of natural history; constructed an immense garden, which he stocked with a prodigious variety of plants; and built an observatory, which he furnished with the best astronomical instruments he could obtain. He died in the year 1799, bequeathing the great wealth which he had amassed principally in charity.

MARTIN, in *Geography*, a small island near the W. coast of Scotland, at the entrance of Loch Broom. N. lat. $57^{\circ} 55'$. W. long. $5^{\circ} 3'$.

MARTIN, a county of Halifax district, North Carolina, adjoining Tyrrel, Halifax, Bertie, and Pitt counties, containing 5312 inhabitants, of whom 1646 are slaves.

MARTIN, *Cape*, a cape of Spain, on the coast of Valencia. N. lat. $38^{\circ} 47'$. E. long. $0^{\circ} 3'$.

MARTIN, *St.*, *Cape*, a cape on the N. coast of New Spain, in the North sea.

MARTIN, *St.*, one of the northernmost of the Caribbee islands in the West Indies, situated between Anguilla on the N. at the distance of $1\frac{1}{2}$ league, and St. Bartholomew on the S.E. at the distance of 15 miles. This island is chiefly valuable for its salt-pits and salt-water lakes, which were held in such estimation by the Spaniards, that they erected a fort upon the island to protect them, and to prevent other nations from making a settlement. The salt-lakes abound in good fish and turtle; and the salt-water pools are the haunts of birds in great number. In this island there is no fresh water, except that which falls from the clouds and is preserved in cisterns. In the woods are wild hogs, turtle-doves, and an innumerable multitude of parrots. Here are also various trees producing gums, and plenty of the candle-tree, splinters of which, when dried and lighted, emit a very fragrant smell. Its tobacco, which is the chief commodity that is cultivated, is reckoned the best in the Caribbee islands.

In 1659 the Spaniards abandoned this island, blew up its fort, and destroyed all the houses and cisterns of the occupiers. The French and Dutch afterwards shared the island between them; but in the year 1689 they were attacked and plundered by sir Timothy Thornhill, and in 1744 the French were driven out by the British forces, and did not return till after the peace of 1763. The two colonies breed poultry and sheep, which they sell to the other islands; and they also cultivate a little cotton and coffee. About forty years ago the French part contained 400 white families, and 10,000 slaves. The Dutch part comprehends sixty families, and about 200 slaves. In March 1801, this island was taken by the British. On the N.W. side it has commodious harbours and bays. N. lat. $18^{\circ} 5'$. W. long. $62^{\circ} 55'$.

MARTIN, *St.*, a town of Hungary, on a small river which runs into the Waag; 10 miles W. of Rosenburg.—Also, a town of Mexico, in the province of Zacatecas; 95 miles S.W. of Zacatecas.—Also, a town of Naples, in Capitanata; 10 miles S. of Termola.—Also, a town of Spain, in Asturia; 44 miles W. of Oviedo.—Also, a town of Spain, in Old Castile, on the Duero; 42 miles S.S.W. of Burgos.—Also, one of the Scilly islands. N. lat. 50° . W. long. $6^{\circ} 14'$. (See *SCILLY ISLANDS*).—Also, a town of the island of Cuba; 130 miles S.W. of Havannah.—Also, a town of France, in the department of the Po; nine miles N.W. of Pinerola.—Also, a town of France, in the department of the Dora; 18 miles S.E. of Aosta.—Also, a

town of France, in the department of the Maritime Alps; 19 miles N. Nice.—Also, a town of Sweden, in South Finland; 50 miles N.E. of Abo.—Also, a town of South America, in the government of Moxes; 180 miles N.N.E. of Trinidad.—Also, a small island in the Pacific ocean, near the coast of Peru. S. lat. 11° .

MARTIN *d'Auxigny*, *St.*, a town of France, in the department of the Cher; six miles N. of Bourges.

MARTIN *d'Auxy*, *St.*, a town of France, in the department of the Saône and Loire; 12 miles S.W. of Chalons fur Saône.

MARTIN *le Beaux*, *St.*, a town of France, in the department of the Indre and Loire, near the Cher; nine miles E.S.E. of Tours.

MARTIN *le Chapelle*, *St.*, a town of France, in the department of the Lozere; 12 miles S.W. of Mende.

MARTIN *de Cleles*, *St.*, a town of France, in the department of the Isere; 21 miles S. of Grenoble.

MARTIN *de Courtijols*, *St.*, a town of France, in the department of the Marne; six miles E.N.E. of Chalons fur Marne.

MARTIN *d'Euriage*, *St.*, a town of France, in the department of the Isere; five miles S.E. of Grenoble.

MARTIN *de Fontenay*, *St.*, a town of France, in the department of the Calvados; four miles S. of Caen.

MARTIN *de Londres*, *St.*, a town of France, in the department of the Herault; 12 miles N.N.W. of Montpellier.

MARTIN *de Palières*, *St.*, a town of France, in the department of the Var; nine miles N. of St. Maximin.

MARTIN *de Ré*, *St.*, a town of France, in the department of the Lower Charente, on the N. coast of the isle of Ré; nine miles W.N.W. of La Rochelle. N. lat. $46^{\circ} 12'$. W. long. $1^{\circ} 38'$.

MARTIN *de Tournon*, *St.*, a town of France, in the department of the Indre; seven miles N.W. of Le Blanc en Berry.

MARTIN *de Trebejo*, *St.*, a town of Spain, in the province of Leon; 41 miles S. of Ciudad Rodrigo.

MARTIN *de Vallamas*, *St.*, a town of France, in the department of the Ardèche; 21 miles S.W. of Tournon.

MARTIN *Zell*, *St.*, a town of Bavaria, in the principality of Kempten, on the Iler; six miles W.S.W. of Kempten. N. lat. $47^{\circ} 38'$. E. long. $10^{\circ} 13'$.

MARTIN *Var*, *Islands of*, three small rocky islands, which, according to Perouse, are mere rocks in the Atlantic ocean; the largest being about a quarter of a league in circumference. At a distance they appear like five heads of land. S. lat. of the largest $20^{\circ} 31'$. W. long. $28^{\circ} 8'$ from Paris.

MARTIN'S, *St.*, *Bay*, a bay on the S. coast of the island of Guernsey.

MARTIN'S, *St.*, *Point*, a cape on the S.E. coast of Guernsey, two miles S. of St. Peter.—Also, a cape on the W. coast of Africa. S. lat. $32^{\circ} 40'$.

MARTIN'S, *St.*, *Islands*, a cluster of small islands in lake Huron. N. lat. $45^{\circ} 33'$. W. long. $84^{\circ} 20'$.

MARTIN, *Marilet*, or *Martinet*, in *Ornithology*. See *HIRUNDO Urbica*.

MARTIN, or *Martlet*, in *Zoology*, the name of a creature of the weasel kind, being the *mustela martes* of Linnæus, with cloven feet, body of a deep yellow colour, approaching to black, and whitish throat. There are two species of this creature, the one called the *martes abietum*, or fir-martin; the other the *martes fagorum*, or beech-martin. The beech-martin is distinguished from the other by having a larger and blacker tail, and being all over of a darker colour, and by

by being white on the throat; whereas the others are yellow; but the species are scarcely kept up distinct, the creatures mixing with one another in the breed. When distinct, the beech-martin is found to be a much tamer creature than the other, and may be kept about houses like a cat; and often lives of its own accord about houses, and among old walls. Their skins make a valuable fur; and that of the fir-martin, or yellow kind, is much the most valuable: prodigious numbers of their skins being annually imported from Hudson's Bay and Canada.

The martin is of the size of a cat, but long-bodied; its legs are also shorter, and its claws less sharp and shorter. Its whole body is covered with hair of a yellowish-black, except only the throat, which, in the beech-martin, or tame kind, is white; and in the wild kind, or fir-martin, yellow: its teeth are sharp and strong, and the dog-teeth, in particular, stand out a great way.

The beech-martin, with us, inhabits woods, makes its lodge in the hollows of trees, and brings from four to six young at a time. It makes great havoc among poultry, game, &c. and will eat mice, rats, and moles. The pine, or fir-martin, inhabits the north of Europe, Asia, and America; and is found also in Great Britain, particularly in Scotland; where it lodges in the fir-forests, building its nest at the top of the trees.

The martin leaves so strong a scent, that the hounds, when out in a morning, will often take it, and make a noble cry. The chase in this case is very good while it lasts, but it is very perplexed; for the creature is not able to run long, and when she is tired, she gets up into a tree; the hounds often lose her on this occasion; but if she is spied up in the tree, she is to be hunted down with sticks, &c. When killed, the hounds are not suffered to eat her flesh, for it is unwholesome.

MARTIN, *Free*, is a name given in this country to a cow-calf, cast at the same time with a bull-calf, which is a kind of hermaphrodite; that is never known to breed, nor to discover the least inclination for the bull: nor does the bull ever take the least notice of this animal. It has all the external marks of a cow-calf, *viz.* the teats, and the external female parts, called by farmers the bearing. When these animals are preserved, it is not for propagation, but for all the purposes of an ox or spayed heifer, *viz.* to yoke with the oxen, and to fatten for the table. They are much larger than either the bull or the cow, and the horns grow larger, being very similar to the horns of an ox. The below of the free martin is like that of an ox; and the meat resembles that of the ox or spayed heifer; being generally finer than that of the bull or cow; and is more susceptible of growing fat with good food. Mr. Hunter has anatomically described three animals of this kind, in the *Phil. Transf.* vol. lxi. part i. p. 289, &c.

MARTIN'S, *St.*, *Cope*, in *Church History*. See COPE.

MARTINAZZO, in *Ornithology*, the name of a species of water-fowl, of the larus or gull kind, the *larus nevius* of Linnæus, and called by the Dutch, the burgomaster of Greenland; by the Cornish people, the *waggell*, or the *great grey-gull*. See LARUS *Nevius*.

MARTINDALE, ADAM, in *Biography*, refusing to conform to principles that he did not believe, was deprived of his living at Rothorn in Cheshire, in the year 1662, after which he acted as chaplain in the family of lord Delamere. He died about the year 1660, and is known as an author, by a useful tract on surveying, called the Land-meters Vade Mecum. He wrote likewise twelve problems on the subject of interest, and two almanacs. He kept a mathematical school at Warrington, and afterwards at Dunham, in Vol. XXII.

Cheshire. In theology he was the author of "Divinity Knots unloosed," and "Truth and Peace restored."

MARTINENGO, in *Geography*, a town of Italy, in the department of the Adda and Oglio; nine miles S. of Bergamo.

MARTINESL, a town of Transylvania; 16 miles S. of Millenbach.

MARTINET, in *Military Language*, denotes a strict disciplinarian, who, in matters of inferior moment, gives officers and soldiers needless trouble. Some say that the term is derived from an adjutant of that name, who was in high repute as a drill officer in the reign of Lewis XIV; but others deduce it from the French "Martinet," which is used to denominate a small cat-o'-nine tails, fixed to the end of a wooden handle, with which schoolmasters punish refractory or idle boys.

MARTINGALE, invented by Evangelista, an eminent horseman of Milan, in the *Manege*, a thong of leather fastened at one end to the girths under the belly of a horse, and at the other end to the bitt, or, which is the better way, to a thin mouth-piece of its own, to hinder him from rearing, or tossing up his head. It is also of service when the horse bears upon the hand, and his head is uncertain and inconstant; when his jaws are too tight, and when he is stag-necked. If the snaffle is used with the reins fastened low, it becomes a martingale, or answers the purpose better; because the hand can make it strict or easy, or both by turns, as the rider pleases, and the horse requires.

MARTINHO, *St.*, in *Geography*, a town of Portugal, in Estramadura, on the N. side of the Donao; 12 miles N.E. of Peniche.

MARTINHO de Mouras, *St.*, a town of Portugal, in the province of Beira; six miles N.W. of Lamego.

MARTINI, MARTIN, in *Biography*, a Jesuit who resided many years in China, concerning which country he wrote some curious memoirs. He returned to Europe in 1671, but probably visited China a second time, where he is thought to have died at about the age of 74; his principal works are "De Bello Tartaros inter et Chineses;" "Sinicæ Historiæ Decas prima a Gentis origine ad Christum natum;" "China illustrata," being a geographical description of that country illustrated by maps of each province: "A Relation of the Number and Quality of the Christians in China." Moreri.

MARTINI, FR. GIAMBATISTA, minor conventuale of the order of St. Francis, member of the Institute and Philharmonic Society at Bologna. This worthy and learned father was well known all over Europe by the title of Padre Martini, and regarded, during the last fifty years of his life, as the most profound harmonist, and the best acquainted with the history and progress of the art and science of music in Italy. All the great masters of his time were ambitious of becoming his disciples, and proud of his approbation. And young professors within his reach never thought themselves, or were thought by others sufficiently skilled in counterpoint, till they had received lessons from this deep theorist, and most intelligent and communicative instructor.

No history of music had been attempted in Italy, since that of Bontempi appeared in 1695, till Padre Martini, in 1757, published in 4to. the first volume of his "Storia Musica," upon so large a scale, that though the chief part of his life seems to have been dedicated to it, only three volumes were published before his decease in 1783.

The first volume of this elaborate work only contains 61 pages of history, which advance no further in the progress of the art, than what the sacred writings have told us concerning its use and cultivation among the Hebrews, Chaldeans, and Egyptians. The rest of the volume is filled

with dissertations. The first is an enquiry what kind of melody mankind is inclined to by nature, untaught by rules or example. Here the ancient Greek systems, tetrachords, scales, and genera are considered, and their numerical proportions given. Much musical erudition is manifested in this dissertation concerning the music of the ancients.

Dissertation II. On what kind of consonance was used by the ancients, or, in other words, whether they had simultaneous harmony, or that kind of *harmony*, or music in parts, which the moderns call *counterpoint*. This subject is well discussed, the opinions pro and contra fairly given, with specimens of early attempts at harmony, and progressive improvements in counterpoint from the time of Guido. Infinite pains have been taken in this profound enquiry. No writer was ever more timid in assertion than the worthy Padre Martini. Not a sentiment has escaped him on the authority of his own opinion or conjecture, all is confirmed by the most curious specimens and citations from the most ancient and respectable writers on the subject.

Dissertation III. Of the melody and musical instruments used by the Hebrews in the Temple. The sacred writings and the fathers have been studiously consulted and quoted in this inquiry, as well as Rabins, and the service of the synagogues, whence several Hebrew chants have been drawn, as well as from the Psalmody of the first reformers, and the canto-fermo of the Missal.

This volume, besides plates of ancient instruments, and musical examples printed with types, has head and tail-pieces in the form of vignettes to each chapter and dissertation, on which are engraved canons by the author in every kind of construction; which being only given in a single part, without bars, and often wrapt up in mystery, their solution will be an excellent study for Tyros in the art of composition.

"Storia della Musica," tomo secondo da F. Giambattista Martini, in Bologna, 1770, 4to. Though thirteen years had elapsed between the publication of the first volume and this, the learned and laborious author has advanced but a little way in the history even of ancient music. The first volume adheres more closely to the subject of his history than this, which is more miscellaneous. Chronologically, the author advances no further in this volume, which is wholly confined to Greek music, than the institution of the Olympic games. So that the period which he describes is limited to fabulous times. Indeed he describes the customs, manners, and uses to which music was applied by the most ancient inhabitants of Greece, more than the music itself, of which there are no remains to give evidence to the wonderful powers ascribed to it. He has a chapter on the origin of music in Greece, chiefly on the word of the poets; and another chapter on the universal use of music among that refined people. In this volume we have, likewise, learned dissertations; one on the singular qualities ascribed to music by the Greeks; and another on the respect which they had for this art, and the wonderful effects said to have been produced by it.

In this volume, besides a number of learned and elaborate canons, placed in a similar manner to those of the first volume, we have a map of ancient Greece and Asia Minor; and in the preface a sketch of the history of the early inhabitants of those countries, who first cultivated the fine arts.

"Storia della Musica," tomo terzo da F. Giambattista Martini, in Bologna, 1781, 4to.

It is much to be lamented that this was the last volume of his elaborate work, which the learned author lived to publish! It is the more to be lamented, as this indefatigable

ecclesiastic had, with incredible pains and considerable expence, collected materials sufficient for the completion of his whole plan. And this third volume advances no further in the history of ancient music, than the period between the establishment of the Olympic games of Greece to the time of Alexander the Great. The history of Roman music only was to have occupied the fourth volume. From the materials of which P. Martini was in possession, there is reason to believe that the history of music in Italy, where the present system throughout Europe had its rise during the middle ages, and from the time of Guido to the present period, would have been the most valuable present to all Europe which the good father could make; but in writing the history of ancient Greece and Roman music, he had no other means of information than those of which others were in possession; the classical writers and their commentators. Of these, indeed, P. Martini has availed himself, it will perhaps be said, to an excessive degree. In the volume now before us, we have a long preface, and canons, as before. And besides the history of music from the first Olympiad, we have the history of every species of poetry that was connected with music, with the history of its professors, as well as of the stage, tragic and comic, and of all the poets and philosophers who cultivated music, and wrote upon the subject. The volume is terminated with another dissertation on the miraculous effects ascribed to the music of the ancient Greeks, with new facts and reasoning. This volume will probably be thought tedious by those who have read, or are able to read, the original authors whence its materials are derived; to others it is a valuable Thesaurus of all that can be extracted concerning music, from the chief writers of high antiquity and authority, that are come down to the present times.

It is but justice to extend the account of this important work beyond the general limits of the short analysis given of other literary musical articles. The style has been said to be dry and prolix. It is indeed enlivened by no extraneous matter, or ingenious reflections; but each page is replete with information on the subject in question; and the notes abound in curious passages from scarce books. The road through which the good father leads us, if not strewn with flowers, is not barren, but frequently affords a glimpse, at least, of incipient cultivation, which excites a wish and eagerness to advance out of twilight, into regions where the sun of science shines with more lustre, to which, alas! the author did not live to lead us.

Between the publication of the second and third volumes of his "Storia Musica," P. Martini published a work, entitled "Essempiare o sia Saggio di Contrappunto," Bologna, two volumes, folio, 1774.

This excellent treatise, though written in defence of a method of composing for the church upon canto-fermo, now on the decline, yet has given the learned author an opportunity of writing its history, explaining its rules, defending the practice, and of inserting such a number of venerable compositions for the church by the greatest masters of choral harmony in Italy, from the beginning of the sixteenth century to the middle of the last, that we know of no book so full of information concerning learned counterpoint, so rich in ancient and scarce compositions, nor so abundant in instructive and critical remarks, as this.

The work is divided into two parts or volumes. In the first, after a candid and fair explanation of his design, and a wish to keep sacred music separate from secular, we have "a short compendium of the elements and rules of counterpoint." The laws of harmony are here comprised in ten rules, which are extremely well explained and illustrated.

We

We then have a fundamental and practical essay on counterpoint constructed upon *canto-fermo*. This is followed by upwards of sixty admirable compositions in all the ecclesiastical tones by the greatest masters of the old school of counterpoint in Italy; such as Animuccia, Cifra, Morales, Palestrina, Pontio, Porta, Willaert, his scholar Zarlino, and others.

The second part contains examples of composition, or a fundamental and practical essay on *contrappunto fugato*, implying the art of fugue. Here all the terms of this art are explained; as subject, answer, point, regular fugue, and imitation. Canon is defined, and indications and signs are given for the commencement of the several parts in Italian, Latin, and Greek, with explanations of other technica placed at the beginning of canons, where *several parts are to be*.

There are prefixed to many ancient canons, certain mottoes and enigmas of very difficult solution. The author has collected and explained a series of these. Other technical terms occur, such as *proposta*, *risposta*, *antecedente*, *consequente*, *contrasoggetto*, *rovescia*, &c. All these rules and terms are illustrated with examples of composition by P. Martini himself. After which we have near fifty compositions in fugue and canon of the most curious kind, from the works of Palestrina, Agostini, Benevoli, Bernabei, Luca Marenzio, Monteverde, Clari, Lotti, Marcello, Perti, Stradella, Steffani, Alessandro Scarlatti, &c. in 2, 3, 4, 5, 6, 7, and 8 parts.

The compositions of these masters are not more admirable than the historical and critical notes of the editor, which young students will find no less instructive than amusing.

In 1769 Padre Martini drew up and gave to his disciples a very short tract, entitled "Compendio della Theoria de numeri per Ufo del Musico di F. Giambatista Martini. Minor Conventuale." In this tract, the good father defines the three principal calculations, ratios, and proportions necessary for a musician to know in the division of the monochord and in temperament:

The *arithmetical progression*, in which the intervals are equidistant.

The *geometrical progression*, or series of numbers in a duplicate ratio.

The *harmonical progression*, consisting of a series of numbers.

See PROGRESSION and PROPORTION, where the English reader will find the several progressions and proportions used in harmonics more clearly explained than in this small tract of Padre Martini, in Italian, or even in a translation of it.

But Padre Martini was attacked in a more rude and formidable manner by Eximeno, in a publication subsequent to his treatise "Dell' origine e delle Rigole della Musica," in a publication under the title of "Dubbio di D. Antonio Eximeno sopra il Saggio di Contrappunto del Giambatista Martini," printed at Rome 1775. In this work, as a defence of his own simple system, he tries to overturn all other systems, particularly that which Padre Martini is endeavouring to explain and defend in his "Saggio di Contrappunto." It is the method of teaching counterpoint by writing upon *canto fermo*, which has been established in the conservatories of Naples more than a hundred years. And when we recollect the great composers, not only of church-music, but theatrical, which the Neapolitan school has produced, we cannot help regarding its method with reverence, particularly as far as regards ecclesiastical composition, alla Palestrina, which is that of our services and full an-

them on the venerable models of Tallis and Bird; nor can that reverence be diminished by the writings of any of its foes, till a better method is discovered, which has not yet been done by signior Eximeno; who is a lively writer, an able logician, and seemingly better skilled in every other art and science than that of music, if we may be allowed to judge by the specimens which he has given in illustration of his own rules of composition, which were intended to supersede all former laws of harmony throughout Europe.

The Neapolitans, whose school and method of teaching counterpoint by writing upon *canto fermo* P. Martini had so well defended in his "Saggio di Contrappunto," published, without name or date, a pamphlet entitled "Giudicio di Apollo." A certain Andrea Manini, of Udini, having, in a work entitled "Trattato in Genere Teorico," published in 1761, treated with disrespect, not only P. Martini, but his excellent master, Jacopo Perti; all the venerable harmonists of the 16th and 17th centuries appear before Apollo in defence of the persons traduced; and Manini, the author of that libel, is sentenced, not only to perpetual banishment from Parnassus, and from all intercourse with the muses and their votaries, but prohibited, in future, from all further use of his pen. This pamphlet issued from the Neapolitan press, was circulated all over Italy, no body knew by whom or by what means.

MARTINI, GIUSEPPE SAN, an exquisite performer on the hautbois, and an original and excellent composer, was a native of Milan; but best known in England by the title of Martini of London, where he arrived in 1723. His first public performance there was at a benefit concert, at the little theatre in the Hay-market, then called the French theatre, from a company of French comedians being allowed to act plays there in the French language, to which George I. frequently went, as his majesty was not sufficiently acquainted with our language to be much amused at our national theatres. The benefit concert at which Martini was first heard, was for a signior Piero; in the advertisement for which, Martini is called "an Italian master, just arrived." But in this performance the applause he received was such, that he was immediately engaged as principal hautbois at the Royal Academy of Music, or Opera, where he continued to perform during the whole time of Handel's regency.

His first publication in England was advertised October 6, 1730; consisting of "Twelve sonatas for two flutes and a bala, being exceeding fine harmony." Such previous praise is seldom given to compositions that deserve it; but the public soon found that a newspaper eulogium, for once, spoke the truth.

About the year 1740, he was taken into the service of his royal highness Frederic prince of Wales, was music-master to the princesses, and gave lessons in singing to several ladies, who had the good taste to be sensible of his merit, and the good fortune to prevail on him to attend them; but he performed no more in public after he quitted the opera.

We never heard him play; but the concertos which Tommy Vincent, his scholar, used to perform on the hautbois, and which he had composed for himself, were admirable; full of fire, and new and elegant passages, in the true genius of the instrument; and the best judges who had often heard him at the opera and in private parties, would allow of no parallel in his tone and execution, with those of any other hautbois player upon earth.

He died about the year 1750. And as a proof of the high admiration with which the public was impressed by his performance, when his books and instruments were sold by auction after his decease, a hautbois on which he used to perform,

perform, which originally only cost five-and-twenty shillings, fold for eighteen guineas, to somebody, who perhaps imagined, that an instrument on which Martini used to play so delightfully, would almost play itself.

As a composer, Martini was possessed of all the learning of the old school, with infinitely more invention, taste, and grace than any other Italian of his time.

His twelve sonatas for two violins and a base, dedicated to the princess of Wales, were very long in high favour with the public; and his full concertos, when performed at the concert of ancient music, still excite the attention and admiration of all true judges of instrumental music. Indeed San Martini was the only composer of whose productions the exclusive admirers of Corelli, Geminiani, and Handel ever spoke without the sarcastic epithet of *new*, or the more broad censure of *modern stimsy stuff*. But Martini still wrote fugues; in spite of which his music stood its ground among the moderns, better than any other instrumental compositions with which we are acquainted.

MARTINI, GIOVANNI BATTISTA SAN, a younger brother of San Martini of London, in 1770, was organist and maestro di cappella to so many churches at Milan, and wrote so fast, that his ecclesiastical compositions were too slight and stimsy. The late viscount Dudley and Ward, when on his travels, took lessons of him in music, and his lordship, then the honourable Mr. Ward, having collected all the curious compositions of the time, in his progress through Italy, Martini eagerly borrowed of his élève all the new music which he could possibly spare, and honestly confessed that it was with a view to feed his own fancy, which, by writing so much and so fast, was a little exalted. There was scarcely a clown in Italy who did not know good music from bad. And we ourselves, on a day of festival, in a church, heard two peasants, after listening a little while to one of Martini's masses, cry out, "Quita musica è scelerata-audire," and hastened away to another church.

The violin music, however, of this Martini, particularly his symphonies, concertos, and nocturni, composed about the middle of the last century, was full of fire, invention, and beautiful melodies. He was one of Giardini's masters on the violin; and the first piece he played in public, after his arrival in England, was a solo at the benefit of Cuzzoni, composed by San Martini of Milan.

Some of his symphonies and full pieces were played at Vauxhall, Ranelagh, Mary-bone, and Cuper's gardens, with great applause, during many years.

MARTINI, Abate, a learned Venetian dilettante, and an excellent judge of every species of music, ancient and modern; was an able mathematician, composer, and performer. He had travelled into Greece, in order to make observations in geography, agriculture, and natural history, but being unable to satisfy himself as he expected, his pride was so hurt by the disappointment, that he would not publish any of his remarks or discoveries. Among other curious enquiries, he made many concerning the music of the modern Greeks, in hopes it would throw some light upon that of the ancient. He knew as much, we believe, as any one else, about the systems of Pythagoras, Ptolemy, and the Greek writers collected by Meibomius, as well as of Rameau and Tartini. He was a great admirer of the works of Marcello, and sung, by heart, all his cantatas and best melodies; and was the founder of an academy for the performance of his music, exclusively.

When he visited the Greek isles, besides enquiries after ancient music, his curiosity extended to the present state of music among the modern Greeks, of which we have spoken

elsewhere. See *MUSIC of the Greek Church*, and *Russian Music*.

MARTINI of Madrid, a lively and spirited composer, who has furnished the theatre Italien, at Paris, with the music of several successful comic operas. We are not much acquainted with the vocal music of this author; but have sometimes thought his instrumental too turbulent and clamorous.

MARTINI, in *Geography*, a town of Naples, in the province of Otranto; 16 miles W. of Ostuni.

MARTINICO, one of the largest of the Caribbee islands in the West Indies, being about 60 miles in length, and 30 in breadth, and containing about 260 square miles. The interior part is hilly, abounding with hillocks or small eminences, above which are elevated three mountains of considerable height. The highest of these, called Pelée, exhibits appearances of an extinct volcano, and is covered with woods that attract the clouds, and occasion noxious damps, which render it in a great measure inaccessible. The other two mountains are in most parts cultivated. These mountains, and particularly the first, furnish springs, from which issue the streams that water the island: these are naturally of gentle current, but, with the slightest storm, are changed into torrents. The chief river is called Galion, and waters the N.E. part of the island. The water which they supply, partaking of the nature of the soil over which they pass, is in some cases excellent, and in others so bad, that the inhabitants are under a necessity of drinking the water which they have collected in the rainy season. The produce of the soil, fertilized by its rivers, is sugar, cotton, indigo, cocoa, ginger, and such other commodities as are found in the neighbouring islands; and as its bays and harbours are numerous, safe, commodious, and well fortified, it is favourably adapted for trade. The island is divided into twenty-eight parishes, which contain about the same number of towns and villages, and two principal towns, *viz.* Fort Royal and St. Pierre. The first Europeans, who formed a settlement in this island, were the French, under the conduct of M. Desnambuc, accompanied by about 100 persons from St. Christopher's in the year 1635: and after having obtained land from the Caribbs, they at length expelled the natives. The French being thus masters of the island, and living without molestation, restricted themselves for some time to the cultivation of cotton, soon adding that of annatto and indigo. About the year 1650, they commenced the culture of sugar; and ten years afterwards, Benjamin Da Costa planted some cocoa-trees. His example was followed in 1684, when the demand for chocolate in France became more common. Cocoa continued for some time to be the principal object of cultivation till the year 1718, when all the cocoa-trees were destroyed. The coffee-tree was then introduced, as a kind of succedaneum to the cocoa which had failed. Martinico promised great advantages to the French; and accordingly it was made the seat of their government, and the object of their particular attention. Nevertheless, at the end of the 17th century, its progress had not been very considerable. In 1700, the whole population, reckoning white men, free negroes, and slaves, amounted to no more than 21,640 persons. The cattle consisted of 3668 horses or mules, and 9217 head of horned cattle. The inhabitants cultivated a great quantity of cocoa, tobacco, and cotton; they had nine indigo houses, and 183 small sugar plantations. In 1736, there were 447 sugar-works; 11,953,232 coffee-trees; 193,870 of cocoa; 2,068,480 of cotton; 39,400 of tobacco; and 6750 of annatto. The population amounted to 72,000 blacks, men, women, and children; and their supplies for provision consisted

filled of banana-trees, cassava, potatoes, and yams. At this time the annual exportation amounted to 700,000*l.* sterling. The export trade was very extensive. However, the war of 1744 checked this prosperity. By a series of misfortunes and losses, Martinico fell into the hands of the English in 1762; but in the following year, at the conclusion of the war, it was restored to its original proprietors. In the year 1770, this island contained 11,588 white people; 2524 free people of colour; 71,142 slaves. It was then thought that the slaves were too few for the cultivation, which was chiefly that of sugar-canes; with some cacao, indigo, cotton, and coffee. The noted snuff, called "Macouba," is made of tobacco raised in the parish of that name in the north of Martinico. About this time its products were computed at 23,000,000*lbs.* of sugar, 3,000,000*lbs.* of coffee, 600,000*lbs.* of cotton, and 40,000*lbs.* of cocoa. In the statistical account of France, published by Herbin, the population of Martinico in 1788 is said to consist of 10,603 whites, 4851 free mulattoes, and 73,416 slaves. The exports at that time amounted to 25,640,000 francs; while the imports from France amounted to 15,133,000 francs of French produce, and 9,198,000 francs of foreign trade. Martinico is celebrated for a distillery of liquors. Quarries of free-stone are rare in this island, and blocks of lava are used. Lime is made with the madrepores and sea-shells. No mines have been discovered; but a ferruginous sand, after a volcanic production, had been observed on the shore near mount Pelée. The inhabitants of Martinico are pale, and destitute of that bloom which is observable in the people of France. Most of the native quadrupeds have been destroyed; but rats and mice unhappily abound. In this island there is a bird called the whistler of the mountain, from the resemblance of his cry to that of a man whistling. The red ant was very destructive till it was destroyed by putting arsenic into its nests, or strewing it over its path. The hurricanes in Martinico are very violent and destructive. The rain descends in large drops resembling the sound of hail. In the year 1794, Martinico was taken by the British under the command of sir John Jervis and sir Charles Grey; the attack commenced Feb. 3, and the island surrendered March 16. N. lat. 14° 24' to 14° 52'. W. long. 61° 2' to 61° 26'.

MARTINICO, *Little*, one of the Grenadine islands in the West Indies. N. lat. 13° 38'. W. long. 61° 18'. See BEKIA.

MARTINIUS, MATTHIAS, in *Biography*, a learned German Protestant divine and philologist, was born in the county of Waldec in the year 1572. He was educated under the celebrated Piscator. When he had attained the age of twenty-three, he was appointed preacher to the court of Nassau-Dillembourg, and in 1596 he was nominated one of the professors of the college of Herborn. He particularly excelled in his philological lectures, and in initiating his pupils in the oriental languages. About the year 1607 or 8, he became pastor of Embden, where he remained three years, much respected and esteemed as a minister and a man. He was now offered the rectorship of the college of Bremen, which he accepted, to the great benefit of that institution. In 1618, Martinius was one of the deputies appointed by the city of Bremen to the synod of Dort, where he enlisted among the combatants against the supralapsarians. He died at the age of 58, in the year 1630. His works are very numerous; but the most important, and that on which his fame is chiefly built, is "Lexicon Philologicum, præcipue Etymologicum et Sacrum," in two large volumes, folio. Moreri.

MARTINO, *St.*, in *Geography*, a town of Italy, in the

department of the Adda and Oglio; 8 miles W. of Bergamo.—Also, a town of France, in the department of the Po, in the district of the Four Vallies, to which it gives name; 9 miles N.W. of Pinerola.—Also, a town of France, in the department of the Sesia; 19 miles N. of Turin.—Also, a town of France, in the department of the Dora, near the Dora Baltea; 17 miles S.E. of Aosta.—Also, a town of France, in the department of the Maritime Alps; 12 miles W. of Tenda.—Also, a town of Italy, in the Veronese; 15 miles N.W. of Verona.—Also, a town of Italy, in the department of the Reno; 12 miles N.E. of Bologna.—Also, a town of Italy, 13 miles N. of Modena.—Also, a town of Naples, in Calabria Ultra; 5 miles N.W. of Oppido.—Also, a town of Naples, in Basilicata; 24 miles S.S.E. of Potenza.—Also, a town of Corsica; 4 miles N. of Bastia.—Also, a town of Italy, in Friuli; 7 miles S.E. of Friuli.

MARTINO *Pescatore*, in *Ichthyology*, a name given by Salvia, and some others, to the rana piscatrix of authors, the lophius of Artedi.

MARTINOWA, in *Geography*, a town of Austrian Poland; 6 miles N. of Halicz.

MARTINSBERG, *St.*, a town of Hungary; 10 miles S.E. of Raab.

MARTINSBOROUGH, a town of America, in North Carolina, on the S. side of Tar river; 20 miles above Washington.

MARTINSBURG, a post-town of Virginia, and capital of Berkley county, about 8 miles S. of the Patowmac, in the midst of a fertile and well cultivated country; 25 miles from the mineral springs at Bath. It contains more than 70 houses, a court-house, gaol, and episcopal church, and another near the town is appropriated to the Presbyterians; 22 miles N.E. of Winchester, and 88 N.N.W. of Alexandria.

MARTINSDYCK, *St.*, a town of Holland, in the island of Tolen; 5 miles W. of Tolen.

MARTINSBERG, a town of Austria; 6 miles S.S.W. of Zwettl.

MARTINVEST, a town of France, in the department of the Channel; 3 miles S. of Cherbourg.

MARTINVILLE, a post-town of America, and the capital of Guilford county, in North Carolina, pleasantly situated on the E. side of Buffaloe creek, and containing about 40 houses, a court-house, and gaol.

MARTIOBARBULI, among the *Romans*, a designation given to soldiers who carried leaden balls to annoy the enemy with.

MARTIORA, or MARTICORA, in *Natural History*, the name which the ancient Greeks gave to the animal which the Romans called *mantichora*.

MARTIZAY, in *Geography*, a town of France, in the department of the Indre; 11 miles S. of Chatillon sur Indre.

MARTLET, in *Heraldry*, a little bird represented without feet, and properly also without a beak.

It is used as a difference, or mark of distinction, of a younger brother; some say, more peculiarly of the fourth brother, or family. See DIFFERENCES.

MARTNETS, in a *Ship*, small lines fastened to the leech of a sail, being reeved through a block on the top-mast-head, and coming down by the mast to the deck. Those martnets which belong to the top-fails are fastened after the same way to the heads of the top-gallant-masts, but their fall comes down no farther than the top, when it is haled. The word is, *top the martnets*, i. e. hale them up. Their design is, in furling the sail, to bring that part of the leech

leetch which is next the yard-arm clofe to the yard, fo that the fail may furl up the clofer.

MARTO, in *Geography*, a town of European Turkey, in Romania; 20 miles S.S.W. of Gallipoli.

MARTOCK, a market town and parifh in the hundred of that name, and county of Somerfet, England. It chiefly deferves notice on account of its church, which is a large and elegant edifice, confifting of a nave, chancel, north and fouth aifles, and a porch. The interior is finely ornamented with carved work, and fome paintings of the apoftles. An altar-piece in ftucco, erected by John Butler, efq. particularly attracts admiration. The market is held twice a week, on Wednesday and Saturday, and is ufually well fupplied with provifions of every defcription. Near the market-houfe, which is a neat modern building, erected at the junction of three turnpike roads, in the middle of the town, ftands a very handsome fluted column, being a model of the famous pillar of Trajan. The parifh is of great extent, and is divided into nine tythings, containing, according to the parliamentary returns of the year 1801, 376 houfes, occupied by 2102 perfons. The town is watered on the fouth-west by the river Parret, and on the north by the Yeo. The manor was poffeffed by Edith, queen of Edward the Confeflor, at the time of the Norman conqueft. The *History of Somerfetfhire*, 3 vols. 4to. 1791.

MARTON, St., a town of Hungary; 10 miles W. of Rosenburg.

MARTORANO, a town of Naples, in Calabria Citra, the fee of a bifhop, fuffragan of Cofenza; 13 miles S. of Cofenza. N. lat. 30° 8'. E. long. 16° 28'.

MARTOREL, a town of Spain, in Catalonia, fituated on the Noya, at its confluence with the Llobregal. This is a fmall, dirty, clofe, and ill-built town; it has a parifh church, a convent of monks, and fome barracks; the inhabitants are laborious; the women make lace and blonds. Near this town is a triumphal arch, faid to have been erected by Hannibal in honour of his father; fituated at the north end of a bridge originally built by his order when he croffed the river in his way to Italy, and repaired in 1768; 20 miles N.W. of Barcelona.

MARTORY, St., a town of France, in the department of the Upper Garonne, on the Garonne; 10 miles N.E. of St. Gaudens.

MARTOS, a town of Spain, in the province of Jaen, fuppofed to be the ancient *Tucci*, afterwards called *Augusta gemella*; fituated on the fide of a lofty mountain, on the top of which is a caftle. The town belongs to the order of Calatrava, by which a civil and military governor are kept there, and an alcade mayor for the adminiftration of juftice. It was once an epifcopal fee, which was deftroyed under the Moors. Its prefent population amounts to 15,000 perfons. The top of the rock on which the caftle ftands is famous for the death of the two brothers of Carvejal, commanders of the order of Calatrava, who under an unfounded charge of murder were precipitated from the rock by order of Ferdinand, king of Caftile; 10 miles W. of Jaen.

MARTRAGNY, a town of France, in the department of the Calvados; nine miles N.N.W. of Caen.

MARTRES, a town of France, in the department of the Upper Garonne; 15 miles N.E. of St. Gaudens.

MARTRES de *Veyre*, Les, a town of France, in the department of the Puy de Dôme; feven miles S.S.E. of Clermont.

MARTYN, JOHN, in *Biography*, late profefor of botany at Cambridge, was born Sept. 12. 1699, in Queen ftreet, London, where his father Thomas, a very worthy and refpectable man, lived in a mercantile ftation. His mo-

ther, whose maiden name was Catharine Weedon, died Nov. 1, 1700. After being educated at a private fchool in the neighbourhood, he was taken, at the age of 16, into the compting-houfe of his father; nor does it appear that he neglected or defpifed the duties of the ftation to which he was then deftined, though he had already imbibed fo ftrong a tafte for literature, that he constantly devoted much of the night to ftudy, allowing himfelf, for many years, no more than four of the 24 hours for fleep. In the fummer of 1718 he firft acquired a tafte for botany, in confequence of his acquaintance with Mr. Wilmer, an apothecary, who afterwards became demonftrator in the Chelsea Garden. He was in the following year introduced to Dr. Patric Blair, and the juftly celebrated Dr. William Sherard, the moft liberal and intelligent promoter of this fcience that his country could then boast. With fuch inftructors and counfellors, his progrefs was rapid. He foon became defirous of commencing author, and it is fortunate that this was not prevented, by his imbibing the diffidence of Sherard along with a portion of his knowledge. Mr. Martyn tranflated Tournefort's hiftory of the plants growing about Paris, from the French into Englifh, in 1720; which however he did not print till twelve years afterwards, when it appeared, dedicated to lord Petre, and improved in many refpects, being accommodated to this country by the addition of Englifh names, and the mention of particular places of growth. Nor were his ftudies merely speculative, or confined to books. He undertook various botanical excursions, which were chiefly performed on foot, that he might obferve plants in their natural fituations, as well as infects, which had now likewife excited his attention. When at home, he bufied himfelf in fowing feeds, that he might fpeculate upon their germination, and the ftructure of their cotyledons, and was eager in collecting, not only dried fpecimens of plants, but their feeds and fruits. His attention to thefe fubjects, prove him to have been no fuperficial enquirer, and his letters to Blair fhew that he ftudied both nature and Cæfalpinus with advantage. The leading character of his mind feems to have been a tafte for enquiry, which prompted him to examine every thing for himfelf. His obfervation of the works of God directed his thoughts to the divine origin of all things, and his perufal of fome of the moft famous adverfaries of revealed religion, ferved but to confirm him in its truth. About the year 1721 he became acquainted with the celebrated Dillenius, and in conjunction with him and feveral others, amongst whom we find the names of Deering, Thomas Dale, and Philip Miller, eftablifhed a botanical fociety, which met every Saturday evening. Dillenius was prefident, and Martyn fecretary. The latter, ever foremost in activity, read before this fociety a courfe of lectures, upon the technical terms of the fcience, the foundation, as it is prefumed, of what he afterwards publifhed. Thefe meetings were continued for about five years only.

We are not informed of the period at which Mr. Martyn changed his mercantile occupation for the medical profefion, to which he was, doubtlefs, led by the general tenour of his purfuits. In 1723 he was offered admiffion into the Royal Society, which he declined, as it appears by one of his letters to Dr. Blair, from pure modefty. His objections however were overcome the next year; and he foon proved himfelf an active and worthy member, by his various communications, to be found in the *Transactions* of that learned body; of which publication he fubfequently took a part in the abridgment, though he was an unfuccefsful candidate for the place of Secretary to the fociety, obtained by Dr. Cromwell Mortimer. In 1726 he publifhed his tables of Official Plants, in 20 pages folio,

folio, disposed according to Ray's system. He had given a public course of lectures in Botany the preceding year, and had, with the assistance of Dr. Blair, undertaken to make a collection of birds. His herborizing excursions were from time to time continued, notwithstanding his various labours and engagements in town. His second course of lectures there, in 1726, being much approved, he was recommended by Dr. Sherard and Sir Hans Sloane as fit to teach the science in which he excelled, to the University of Cambridge. He gave, in 1727, in the anatomy schools, the first botanical course ever read in that University, though Ray had studied there, and done all that he could to excite a love of natural knowledge. For the use of his pupils he reduced the alphabetical catalogue of Cambridge Plants, printed by that great man, into a systematic form, according to the principles of its author. As he excelled in the knowledge of Cryptogamous vegetables, he improved the work in that department; and he now very judiciously laid aside the old systematic practice, of separating trees and shrubs from herbs, in his classification. When we consider what Mr. Martyn meditated, and what he accomplished, in the technical and systematic departments of Botany, he will be found to deserve a high rank amongst the philosophers, even of the age in which he lived; nor did he leave any walk of his beloved science unexplored. In 1728 he published the first Decade of a sumptuous work, entitled *Historia Plantarum Rariorum*, in imperial folio, in which his merit in the descriptive line is conspicuous. The plates were drawn by that great artist Van Huysum, engraved in mezzotinto by Kirkall, and printed in colours. In the latter part of their execution they fail very much, that mode of colouring plates having scarcely ever been found to answer, though at present carried in France to a higher degree of perfection than heretofore. (See *FIGURES of Plants*.) Four more Decades of this work appeared in the course of nine years, after which it ceased, on account of the great expence of the undertaking.

When this publication commenced, its author is said to have "sedulously applied himself to the practice of physic." We presume this must have been as an apothecary, for he was not, by any medical degree, authorized to practise as a physician.

In 1729 he had a design of reading botanical lectures at Oxford, and it is not known what prevented this scheme. Probably the recent establishment of the Sherardian professorship there, in favour of his friend Dillenius, might very justly deter Mr. Martyn from what could not but seem an unnecessary, if not an unfair, intrusion.

In the following year we find him projecting, in conjunction with Dr. Ruffel, the Herculean labour of a new edition of Stephens's Latin *Theaurus*; but this design was dropped. Instead of it, he associated himself with the same friend, and some others, in a critical work, entitled the *Grub-street Journal*, a periodical publication, which had a large sale. In what style or temper it was executed we have not had an opportunity to inquire; but the critical dissertations of our author, published by his son, display his critical learning and acuteness in no ordinary degree.

On the 26th of May, 1730, Mr. Martyn was admitted of Emanuel College, Cambridge, with an intention of taking his degrees in physic; but after keeping five terms, his marriage, and the necessary attendance to his profession, caused him to relinquish this design. He had resided for three years in Great St. Helen's, but the town air disagreeing with his constitution, which was asthmatic, he removed to Chelsea, where he married, on the 20th of August 1732, Eulalia, youngest daughter of John King, D.D.

rector of Chelsea and prebendary of York, by whom he had three sons and five daughters. Four of the latter died young, but the other children survived him.

At the close of this year the Professorship of Botany at Cambridge became vacant, by the death of Mr. Bradley, who had for some years, not very worthily, filled it. All eyes were directed towards Mr. Martyn as the properest person for this situation, and his opponents, who wished to obtain it for themselves or their friends, conscious of his superior merit, had no other resource than to represent him as a Nonjuror. Whatever effect this might have had was defeated, by his taking the requisite oaths, and his unanimous election took place on the 8th of February 1733. It is remarkable that in two or three years after obtaining the appointment, he finally ceased to lecture. This is attributed to the want of encouragement, and especially of a botanic garden, at Cambridge. There had been hopes of the latter being established in 1731, through the liberality and zeal of a Mr. Brownell of Willingham; but the scheme fell to the ground, nor was it revived with effect till many years afterwards.

Nevertheless, our indefatigable botanist and scholar was not idle. The work on which his literary fame chiefly and firmly rests is his splendid quarto edition of Virgil's *Georgics*, which appeared in 1741, dedicated to Dr. Mead. Here his abilities and his acquisitions had their full scope. The text was accompanied by an English translation, and ample notes in the same language. In these the editor was enabled, by his peculiar line of study, to throw more light upon the natural history of his author, than any one before him had done, nor is it easy to improve upon his performance. He was assisted in the astronomical part by his friend the celebrated Halley, to whose worth he has given a just and feeling tribute in the preface. In 1749 he published the *Bucolics* on the same plan, and intended to have gone through the whole of the Roman poet; but growing infirmities, and the loss of his wife, who died of a cancer in the breast this year, for a while damped his ardour. The labours of his profession, too, were becoming burthensome. He speedily indeed repaired his domestic loss, marrying, in July 1750, Mary Anne, daughter of Claude Fonnereau, Esq: of London, merchant. This lady bore him one son, and survived him.

In the spring of the year 1752 he retired from practice, and devoted himself to that rural seclusion, which his acquirements were so well calculated to render both profitable and delightful. He took a farm in a most beautiful situation at Streatham, and, but for occasional attacks of the gout, enjoyed several years of learned leisure united with scientific experience, in attention to the business of his farm, and the care of his family. On the 30th of January 1761, he resigned his professorship of botany in favour of his son the Rev. Thomas Martyn, who was elected in his stead, and who has ever since filled that station with honour to himself and to his parent. In gratitude for this election, so consonant to his own wishes, Mr. Martyn, some time afterwards, gave his botanical library, of above 200 volumes, with his drawings, herbarium, and collections of seeds and *Materia Medica*, to the university, for which the thanks of that body were very handsomely returned him in 1765.

This worthy man died at Chelsea, to which place his increasing infirmities had induced him, about a year previous, to return, on the 29th of January 1768, in the sixty-ninth year of his age, and was interred in the burying-ground there, near his first wife; where also the relics of Miller, Ehret, and, if we mistake not, of several other botanists, repose. Our account of him is chiefly taken from a small

volume, published in 1770, by his amiable son and successor, who commemorates, in the highest terms, his religious, liberal, benevolent, and affectionate character. This volume contains some of his epistolary correspondence, and several learned dissertations, preparatory to his intended edition of the *Æneid*. The present Professor Martyn is known by several ingenious works, especially by his greatly enlarged edition of Miller's *Gardener's Dictionary*, to the botanical part of which we have occasion, in the course of our labours, perpetually to refer. S.

MARTYNIA, in *Botany*, was so called by Dr. Houttoun, after his friend Mr. John Martyn, professor of Botany at Cambridge, father of the present professor; see the last article.—Linn. Gen. 310. Schreb. 406. Willd. Sp. Pl. v. 3. 263. Mart. Mill. Dict. v. 3. Rel. Hoult. 5. t. 10. Ait. Hort. Kew. ed. 1. v. 2. 339. Juss. 140. Lamarck Illustr. t. 537. Gært. t. 110. (Craniolaria; Linn. Gen. 310. Juss. 140.)—Class and order, *Didymia Angiospermia*. Nat. Ord. *Perfonate*, Linn. *Bignonia*, Juss.

Gen. Ch. *Cal.* Perianth inferior, in five unequal segments, withering. *Cor.* of one petal, bell-shaped; tube inflated; spreading upwards, gibbous, and bearing honey, on one side at the base; limb in five obtuse, nearly equal segments, the lowermost rather the largest and most erect, slightly concave and crenate. *Stam.* Filaments four, thread-shaped, incurved, with the short pointed rudiment of a fifth between the upper pair; anthers two-lobed, converging, the two uppermost sometimes abortive. *Pist.* Germen superior, oblong; style thread-shaped, simple, as long as the stamens; stigma two-lobed. *Peric.* Capsule woody, oblong, gibbous, quadrangular, with two furrows at each side, pointed and recurved at the summit, separating into two parts, enclosing an internal nucleus of four cells. *Seeds* several, ovate, tuberculated with a pulpy coat.

Ess. Ch. Calyx five-cleft, inferior. Corolla ringent. Capsule woody, coated, with a hooked point, two valves and four cells. Seeds several, ovate, pulpy.

Obf. The *Martynia perennis* of Linnæus, having an inferior germen, and very different fruit, is now made a distinct genus. See GLOXINIA.

1. *M. diandra*. Diandrous Martynia. Gloxin. Obf. 14. t. 1. Willd. n. 1. Jacq. Hort. Schoenbr. v. 3. 21. t. 289. (*M. annua*, villosa et viscosa, folio subrotundo, flore magno rubro; Hoult. in Mart. Decad. 42. t. 42.)—Stem branched. Leaves heart-shaped, toothed. Two stamens abortive. Beak of the capsule very short.—Discovered at Vera Cruz in South America, by Dr. Houttoun, who sent seeds to Chelsea garden in 1731, which being sown in a hot-bed, the plants flowered after midsummer. The root is annual. The whole plant downy, viscid, soft, juicy, and fetid, of luxuriant growth. Stem a yard high, as thick as the finger, round, hollow, leafy; branched and purplish above. Leaves opposite, heart-shaped, acute, toothed, pliable, six or eight inches in diameter, on long, round, purplish, spreading footstalks, without stipulas. Clusters from the forks of the stem, of several pendulous handsome flowers, the size and shape nearly of the Purple Foxglove, but their tube is nearly whole and downy, their limb of a rich crimson. Each flower has a pair of ovate purplish downy bractæas, at the base of its calyx, and equal to that part in length. Capsule ovate, about an inch long, with a very short recurved beak.

2. *M. Craniolaria*. Five-lobed Martynia. Gloxin. Obf. 14. Swartz Obf. 230. (*M. spathacea*; Lamarck Dict. v. 2. 112. *M. annua*, villosa et viscosa, acris folio, flore albo, tubo longissimo; Ehrh. Piët. t. 1. f. 2. *Craniolaria annua*; Linn. Sp. Pl. 862. Mant. 417. Jacq. Amer. 173.

t. 110.)—Stem branched. Leaves five-lobed, toothed. Beak of the capsule very short. Tube of the corolla thread-shaped, very long. Calyx sheath-like.—Found by Jacquiu in cultivated fields, and ground lately cleared from wood, at Carthagena in South America, flowering in June and July, and ripening seed in October. We have not heard of this species having ever been brought to Europe. It has the viscid downy habit, and rank growth, of the rest of the genus. Root annual. Stem branched from the very bottom, widely spreading. Leaves opposite, stalked, large, divided half-way down into five acute toothed lobes; heart-shaped and three-nerved at the base. Clusters chiefly from the forks of the stem, lax, erect, almost a foot long, about ten-flowered. The flowers are inodorous, white, remarkable for their slender tube, which is five times as long as their broad rounded limb, and swells suddenly at the top into a globose or ovate figure. The calyx is ovate, tumid, split down on one side only, its border very slightly cloven. All the stamens are fertile. Capsule much like the preceding.

3. *M. Proboscidea*. Long-beaked Martynia. Ait. Hort. Kew. n. 1. Gloxin. Obf. 14. (*M. annua*; Linn. Sp. Pl. 862. Swartz Obf. 230. Gært. v. 2. 131. t. 110. *M. caule ramoso, foliis cordato-ovatis pilosis*; Mill. Ic. 191. t. 286. *Proboscidea Jussieu*; Schmid. Ic. 49. t. 12, 13.)—Stem branched. Leaves heart-shaped, wavy. Beak longer than the capsule. Tube of the corolla scarcely longer than the limb.—Native of the country about the Mississippi, from whence seeds were brought to the Paris gardens. Miller had some of the produce, and the plants flowered with him at Chelsea, before the year 1759, when he published his very excellent figure of this species, surpassed only by the elaborate and exquisite delineations of Schmidel. Linnæus had this plant also in the Upsal garden; and it is doubtless what he intended by *M. annua*, though he confounded the first species, if not the second also, with it. As the whole genus is annual, the above expressive name has been preferred. The leaves are heart-shaped, obtuse, undivided, and nearly entire, sometimes, but not invariably, alternate; their footstalks and ribs very hairy. Clusters terminal, many-flowered, lax, and hairy. Calyx bell-shaped, very unequally five-lobed. Bractæas at its base linear. Corolla pale flesh-coloured, internally dotted with purple; its tube declining, an inch long, and about half as much in diameter; limb in five broad, obtuse, wavy segments, almost as long as the tube, at least if their combined base be reckoned as a part of the limb; there are about five longitudinal orange stripes, within the tube, along its lower side. The capsule is remarkable for its long beak, and for a longitudinal crest-like internal ridge, connecting the nucleus with the coat. The stigma consists of two flat obovate valves, which Turra observed to be irritable, closing when touched.

4. *M. longiflora*. Long-flowered Cape Martynia. Linn. Syst. Veg. ed. 14. 559. Ait. Hort. Kew. n. 2. Meerburgh Ic. t. 7. (*M. capensis*; Gloxin. Obf. 13.)—Stem nearly simple. Leaves roundish, wavy. Capsule with two teeth at the base, and a very short abrupt beak. Tube of the corolla thrice as long as the limb.—Native of the Cape of Good Hope. Professor David van Royen sent its seeds to Linnæus, by the name of a new *Pedalium*. These vegetated and produced flowers in the Upsal garden. A sketch, which appears to be the prototype of Meerburgh's rude but expressive plate, was sent with the seeds. This is the least beautiful of the genus. It is annual like the rest, but more hardy, flowering in the greenhouse in July and August. The stem bears only short axillary branches. The leaves are rounded, and wavy, or bluntly toothed, nearly smooth.

Flowers

Flowers axillary, solitary, on shortish stalks, at whose base is a pair of glands. *Calyx* very small and short, with five teeth. *Corolla* white; tube declining, two inches long, slender, but less so than that of *M. Craniolaria*; limb in five irregular roundish lobes. *Capful* oblong, with a pair of recurved teeth above, near the base, and an oblique, abrupt, scarcely hooked, very short beak. The *stigma* is linear and revolute.—There are considerable aberrations in various parts of the fructification in the different species, and yet the whole undoubtedly constitute a most natural genus, well defined by its fruit.

MARTYNTIA, in *Gardening*, contains plants of the tender, herbaceous, flowery kind, of which the species mostly cultivated are, the two-stamened Martynia (*M. diandra*); the hairy Martynia (*M. proboscidea*); and the perennial Martynia (*M. perennis*).

But there are other species which may be cultivated.

Method of Culture.—The two first sorts of these plants may be increased by sowing the seeds in pots filled with light rich mould, in the spring, plunging them in a bark-hot-bed, giving water frequently. When the plants have attained a little growth, they should be removed into separate pots of the same sort of earth, replunging them in the bark-bed, giving due water and shade, till they become properly rooted, when they must have free air in fine weather: after they are a little advanced in their growth, they should be removed into larger pots, and be replaced in the bark-bed in the stove, due room being allowed them. They should constantly be kept in this situation, and be duly watered and supplied with fresh air in warm weather.

And the third sort may be raised by dividing the roots, and planting them in the spring, as about the middle of March, in pots of light rich earth, being plunged in the bark-bed of the stove. When the plants are up, they should be duly watered in a slight manner, and in warm weather fresh air be freely admitted, keeping them from being shaded by other plants. Even the cuttings of the shoots of the young stems planted in pots, and managed in the above manner, will also take root and form plants.

These afford ornament and variety among other stove plants.

MARTYR, JUSTIN, in *Biography*, a Christian father, who flourished about the year 140 of the Christian era, was the son of Priscus, and born in Flavia Neapolis, anciently called Sichem, a city of Samaria, in Palestine. He was born, according to Tillemont, in 103, but, according to Fabricius and Grabe, in 89. In his youth, he was a lover of truth, and studied philosophy under several masters; first under a Stoic, next a Peripatetic, then a Pythagorean, and lastly, a Platonic, whose principles he preferred above all other, till he became acquainted with the Christian religion, which he embraced as the only certain and useful philosophy. The time of his conversion to Christianity is uncertain: Cave and Tillemont conjecture, that it happened about the year 132 or 133. The first of these writers gives the following account of the course of his life, after his conversion. In the beginning of the reign of Antoninus the Pious, he came to Rome; and in the year 140 presented his First Apology to that emperor. Afterwards he went into Asia, where he had the celebrated conference with Trypho the Jew; and then returned again to Rome, where he wrote his Second Apology, inscribed to Marcus Antoninus, the philosopher, and suffered martyrdom about the year 164. Tillemont is inclined to place his death in 167 or 168. Fabricius supposes that he suffered martyrdom in the 74th year of his age, A.D. 163; but Grabe refers his martyrdom to the year 163 or 165, in the 74th or 76th year of his age.

VOL. XXII.

Justin is mentioned by many ancient Christian writers, who bear honourable testimony to his memory.

Eusebius, besides the accounts he had before given of Justin's books against Marcion, and all heresies, and his apologies, gives also this distinct enumeration of his works. He says, that Justin left behind him a great number of very useful works; as his Apology to Antoninus the Pious, and his sons, and the Roman senate, and another to his successor; a book against the Greeks (or Gentiles); another book against the Gentiles, called Elenchus (or a Confutation); another of the Monarchy of God; another, entitled Pfalter; of the Soul; a Dialogue against the Jews, which he had at Ephesus with Trypho. There are also, says Eusebius, many other books of his, which are in the hands of the brethren. Jerom's account of Justin's works agrees with that of Eusebius.

However, the principal works of Justin are his two Apologies, and his Dialogue with Trypho the Jew, in two parts. According to Tillemont, with whom Grabe and the Benedictine editors of Justin's works agree, the first and larger apology was not presented to the emperor before the year 170. Cave says that it was presented in 140; Pagi and Bafnage refer it to the year 139, and Massuet to about 145. The Dialogue with Trypho was written, according to Pagi and Bafnage, in the year 139; and according to Massuet and the Benedictines, about the year 155. The Second Apology seems to have been presented to Marcus Antoninus in the beginning of his reign, or about the year 162. The larger Apology is still extant entire: the beginning of the second apology is wanting; and so is the conclusion of the first and beginning of the second part of the Dialogue with Trypho. Besides these, there are two Discourses to the Gentiles, generally allowed to be Justin's; one called an Oration to the Gentiles, the other *παρηγορησις*, or an exhortation to the Gentiles, supposed to be the Elenchus mentioned by Eusebius. The piece now extant of the Monarchy of God, seems to be a fragment of that work of Justin. The epistle to Zeno and Serenus is at best doubtful, and thought by Lardner not to be Justin's. The epistle to Diognetus is generally supposed to be Justin's, though some have doubted it, on account of the style, which is more elegant than that of Justin's other pieces. The *Questiones et Responiones ad Orthodoxos*, and some other pieces usually joined with Justin's works, are allowed to bear the marks of a later time.

In Justin's works there are numerous quotations of our gospels, except that of St. Mark, which he has seldom quoted: and he quotes them, as containing authentic accounts of Jesus Christ and his doctrines. These gospels were read and expounded in the solemn assemblies of the Christians, as the books of the Old Testament were; and as they had been before in the Jewish synagogues. This reading of the gospels Justin mentions in his first apology to Antoninus the Pious. This general reading of the gospels, as a part of divine worship at that time, about the year 140, or not very long after, is not only a proof that they were well known, and allowed to be genuine, but also that they were in the highest esteem. Other passages alleged by Dr. Lardner, relate to the Acts of the Apostles, the Epistle to the Romans, the first to the Corinthians, the Epistles to the Galatians, Ephesians, Philippians, and Colossians, the second to the Thessalonians, the Epistle to the Hebrews, the second of Peter, and the book of the Revelations.

Of Justin's works there have been numerous impressions; but that of Prudent Marand, a learned Benedictine, printed at Paris in 1742, fol. and Styan's Thirby's edition of the two Apologies, and Dialogue with Trypho, printed at Lon-

don in 1722, fol. are the best. Fabr. Bibl. Eccl. ad Hieron. c. xxiii. Cave's Hist. Lit. vol. i. Lardner's Works, vol. ii. Brucker's Hist. Phil. by Enf. vol. ii.

MARTYR, or MARTIRE, PETER, a native of Anghierra, in the Milanese, was born in 1455. He is distinguished in history as an able negociator, and was employed by Ferdinand V., king of Castile and Arragon, in the education of his children. He obtained some ecclesiastical benefices, and died in 1525. He wrote a history of the discovery of America, under the title of "De Rebus Oceanicis et Orbe novo;" an account of his embassy, which he undertook at the desire of Ferdinand, with a description of the countries through which he passed, entitled "De Legatione Babylonica;" and a work entitled "Epistolæ de Rebus Hispanicis," containing a history of the most memorable events in his time, from 1488 to 1525. After his return from Egypt, he was rewarded with ecclesiastical preferment, and received many favours from pope Adrian VI., who would have taken him to Rome, had he not excused himself on account of his advanced age. He died about the year 1526, and was buried in the cathedral of Grenada, of which he was canon and prior. Gen. Biog.

MARTYR, PETER, a distinguished reformer in the sixteenth century, was born at Florence in the year 1500. He was initiated into the principles of the Latin language by his mother, who was so well skilled in that tongue, as to be able to interpret the comedies of Terence from the original. He was afterwards placed under the tuition of a very able master, who taught the children of the principal families in the republic, among whom Peter distinguished himself by the avidity which he discovered for learning, his incessant application, and his rapid progress. When he was sixteen years of age, he conceived an inclination for the monastic life, and took the habit among the regular canons of St. Augustine, at the monastery of Fiesoli, near Florence. This step was taken without the consent or knowledge of his father, who on that account left the bulk of his property, at his death, to an hospital, reserving only a small annuity for his son. In the monastery he went through the different branches of science usually taught there, and acquired the character of the first scholar in his order, and he was as eloquent as he was learned. At the age of twenty-six he was appointed to the service of the pulpit, and preached to very crowded auditories, with universal applause, in several of the principal cities of Italy. Notwithstanding his great popularity, and his preferences in the church, particularly that of principal of the college of St. Peter at the altar in Naples, a post of great dignity, and supported by ample revenues, he cheerfully relinquished all, on account of the conviction which he felt upon the perusal of the writings of Luther, Zuingle, and Bucer. His sentiments having undergone a complete change he did not scruple privately to make converts to the new doctrines; at length his zeal carried him so far as to lead him to avow his sentiments in his public discourses. This kind of freedom quickly excited a host of enemies against him, and he was summoned to give an account of his conduct before a general meeting of the order at Genoa. Peter, however, knew what sort of a tribunal it was before which he was commanded to appear, and accordingly withdrew privately to Pisa, where he wrote letters in justification of his sudden departure, and where he celebrated the Lord's-supper according to the manner of the reformed. From Pisa he went to Florence, where he met with the celebrated Bernard Ochinus, who, like himself, had embraced the Protestant faith, and determined to renounce his country rather than shrink from the conscientious discharge of his duty. Quitting Florence, he passed through the nor-

thern parts of Italy without being discovered, and arrived safe in Switzerland, where he was received with the greatest hospitality by the ministers of Zurich in the year 1542. He was shortly after this invited to Strasburg, at which city he filled, for the space of five years, the theological chair, and maintained the utmost harmony with Bucer, who was his colleague in the ministerial office. In 1546, he married a nun who had escaped from a convent and become a Protestant; and in the following year he was invited by king Edward VI. into England, together with Bucer, Fagius, and other learned reformers. He gladly embraced the offer thus made him, and was, in 1549, appointed professor of divinity at the university of Oxford. He was promoted by the king to a canonry of Christchurch, and admitted to the degree of doctor of divinity in this university. In this situation Peter Martyr continued faithfully and diligently occupied in disseminating scriptural knowledge, till the death of the king, and the accession of queen Mary, when the kingdom was once more brought under the yoke of Rome. On this event, Peter Martyr was obliged to leave the kingdom. He had the good fortune to arrive safely at Strasburg, when he was very soon replaced in the divinity chair, from whence he removed to Zurich in 1556, to undertake the professorship of divinity, which had just become vacant. Here he spent seven of the happiest years of his life, in high reputation as a professor and minister, greatly respected by all ranks of people, and in habits of intimate friendship with Bullinger and other learned men. Upon the accession of Elizabeth to the crown of England, and the re-establishment of the Protestant religion, great pains were used to bring him back again to the professorship of Oxford, but without success. In 1561, he was earnestly requested by the queen-mother of France, the king of Navarre, the prince of Conde, and many of the most distinguished peers of France, to attend and assist at the famous conference at Poissy: here he was distinguished by his skill in disputation, as well as by the temper and prudence with which he conducted himself, and by his great zeal in justifying the sufficiency of the scriptures, as a test of truth as well as the rule of life. He died at Zurich in the year 1562, soon after he had completed the sixty-second year of his age. He was author of many learned works, especially of "Commentaries on most of the Books of the Old Testament, and on the Epistle of St. Paul to the Romans, and the first Epistle to the Corinthians." Of the first reformers no one, excepting Calvin, wrote better than Peter Martyr, and he even surpassed Calvin in erudition and the knowledge of the languages. He was thoroughly acquainted with the writings of the fathers, and applied himself most diligently to the study of the ancient discipline of the church. His theses were said to be extremely judicious, and his sermons eloquent and abounding in good maxims. After his death was published a posthumous work entitled "Petri Martyris Vermillii, &c. Loci communes," consisting of selections from his works, digested into an uniform treatise, and systematically arranged after a similar manner with Calvin's Institutions. Moreri.

MARTYR, a person who suffers torments, and even death, in defence of the truth of the gospel: and thus they are distinguished from confessors. See CONFESSOR.

The word is Greek, *μαρτυρ*, and properly signifies a *witness*. It is applied, by way of eminence, to those who suffer in testimony to the truth of the gospel.

Anciently those who were banished for the faith, were called martyrs, and also those who perished in the holy wars. In the time of St. Augustine, the title of martyr was

was given to confessors, or those who were tortured for the faith, without losing their lives. It is Tertullian's thought in his Apologetic: "Plures efficitur, quoties metimur; semen ecclesie est sanguis Christianus."

St. Stephen is called the *proto-martyr*, or first martyr.—The first three or four ages of the church were stained with the blood of martyrs, who suffered for the name of Jesus. The greatness of their number is acknowledged by all who have a competent acquaintance with ancient history, and who have examined that matter with any degree of impartiality. Accordingly, 19,700 are computed to have suffered martyrdom with St. Irenæus at Lyons, under the empire of Severus: 6666 soldiers of the Theban legion are said to have been martyred in Gaul: father Papebroch reckons 16,000 Abyssinian martyrs, and 150,000 others under Dioclesian alone.

Mr. Dodwell, however, endeavours to invalidate the unanimous decisions of the ancient historians, and to prove in a dissertation (*De Paucitate Martyrum*), that the number of martyrs who suffered under the Roman emperors was very moderate; alleging, that those of whom we have accounts in the fathers, are comprehended within a very small compass; and that, excepting Nero and Domitian, the rest of the emperors made scarcely any.

After Dodwell, several writers have maintained his opinion, and asserted, that whatever may have been the calamities which the Christians, in general, suffered for their attachment to the gospel, very few were put to death on that account. In this number we may include Mr. Gibbon, the celebrated historian of "The Decline and Fall of the Roman Empire," who, after observing that "the deaths of a few eminent martyrs have been recorded with care," professes "to separate (if it be possible) a few authentic as well as interesting facts from an indigested mass of fiction and error, and to relate, in a clear and rational manner, the causes, the extent, the duration, and the most important circumstances of the persecutions to which the first Christians were exposed." Of these persecutions we propose to give an account under the article PERSECUTION; and we shall leave it to the attentive and candid readers of the 16th chapter of our author's second volume to judge, how far he has acquitted himself with impartiality, and with justice to the suffering Christians or their unrelenting persecutors. "History," the ingenious historian very properly observes, "which undertakes to record the transactions of the past, for the instruction of future ages, would ill deserve that honourable office, if she condescended to plead the cause of tyrants, or to justify the maxims of persecution."—"It must, however," he says, "be acknowledged, that the conduct of the emperors who appeared the least favourable to the primitive church, is by no means so criminal as that of modern sovereigns, who have employed the arm of violence and terror against the religious opinions of any part of their subjects. From these reflections, or even from their own feelings, a Charles V. or a Louis XIV. might have acquired a just knowledge of the rights of conscience, of the obligations of faith, and of the innocence of error. But the princes and magistrates of ancient Rome were strangers to those principles which inspired and authorized the inflexible obstinacy of the Christians in the cause of truth, nor could they themselves discover in their own breasts any motive which would have prompted them to refuse a legal, and as it were, a natural submission to the sacred institutions of their country. The same reason which contributes to alleviate the guilt, must have tended to abate the rigour, of their persecutions. As they were actuated, not by the furious zeal of bigots, but by

the temperate policy of legislators, contempt must often have relaxed, and humanity must frequently have suspended, the execution of those laws, which they enacted against the humble and obscure followers of Christ." After this general apology for the ancient persecutors of the Christians, our author proceeds to deduce, from a general view of their character and motives, the following conclusions in their favour: "1. That a considerable time elapsed before they considered the new sectaries as an object deserving the attention of government. 2. That in the conviction of any of their subjects who were accused of so very singular a crime, they proceeded with caution and reluctance. 3. That they were moderate in the use of punishments; and 4. That the afflicted church enjoyed many intervals of peace and tranquillity." How far these conclusions are justified by the facts which our author adduces, we leave for the present to the judgment of the reader, and refer him to the article PERSECUTION. To the humanity of the Roman magistrates he ascribes the inconsiderable number of Christian martyrs. "The martyrs," he says, "devoted to immediate execution by the Roman magistrates, appear to have been selected from the most opposite extremes. They were either bishops and presbyters, the persons the most distinguished among the Christians by their rank and influence, and whose example might strike terror into the whole sect; or else they were the meanest and most abject among them, particularly those of the servile condition, whose lives were esteemed of little value, and whose sufferings were viewed by the ancients with too careless an indifference. The learned Origen, who, from his experience as well as reading, was intimately acquainted with the history of the Christians, declares, in the most express terms, that the number of martyrs was very inconsiderable. His authority alone would be sufficient to annihilate that formidable army of martyrs, whose relics, drawn for the most part from the catacombs of Rome, have replenished for many churches, and whose marvellous achievements have been the subject of so many volumes of Holy Romance." Our author adds, "that the general assertion of Origen may be explained and confirmed by the particular testimony of his friend Dionysius, who, in the immense city of Alexandria, and under the rigorous persecution of Decius, reckons only ten men and seven women, who suffered for the profession of the Christian name." The number of martyrs, according to our author, was owing in a great degree to the distinctions that were conferred on their remains and on their memory by survivors. "The sober discretion of the present age, will more readily censure than admire, but can more easily admire than imitate, the fervour of the first Christians, who, according to the lively expression of Sulpicius Severus, demand martyrdom with more eagerness than his own contemporaries solicited a bishopric." "The Christians sometimes supplied by their voluntary declaration the want of an accuser, rudely disturbed the public service of Paganism, and rushing in crowds round the tribunal of the magistrates, called upon them to pronounce, and to inflict the sentence of the law." And it is added, that "the more prudent rulers of the church found themselves obliged to restrain the indecent ardour of their followers, and to distrust a constancy which too often abandoned them in the hour of trial." In forming an estimate of those who suffered death in consequence of the edicts published by Dioclesian, his associates, and successors, our author, deriving his data from the history of Eusebius, who enumerates the martyrs of Palestine at 92, considers Palestine as the 16th part of the eastern empire; and supposing that the country which had given birth to Christianity produced at least the 16th part of the martyrs, who suffered

death within the dominions of Galerius and Maximin; he infers, that the whole might consequently amount to about 1500; a number which, if it be equally divided between the 10 years of the persecution, will allow an annual consumption of 150 martyrs. Allotting the same proportion to the provinces of Italy, Africa, and perhaps Spain, where, at the end of two or three years, the rigour of the penal laws was either suspended or abolished, the multitude of Christians in the Roman empire, on whom a capital punishment was inflicted by a judicial sentence, will be reduced to somewhat less than 2000 persons, since it cannot be doubted that the Christians were more numerous, and their enemies more exasperated, in the time of Diocletian, than they had ever been in any former persecution. This probable and moderate computation may teach us to estimate the number of primitive saints and martyrs, who sacrificed their lives for the important purpose of introducing Christianity into the world." Our author concludes his remarks upon this subject, with suggesting a melancholy truth, which, whatever may be thought of his general reasoning, will be both allowed and lamented. "Admitting," he says, "all that history has recorded, or devotion has figured, on the subject of martyrdoms, it must still be acknowledged, that the Christians, in the course of their intestine divisions, have inflicted far greater severities on each other, than they had experienced from the zeal of infidels."—"In the Netherlands alone, more than 100,000 of the subjects of Charles V. are said to have suffered by the hand of the executioner; and this extraordinary number is attested by Grotius." (Annal. de Rebus Belgicis, L. i. p. 12. fol. ed.) If this be admitted as true, it must follow, that the number of Protestants who were executed in a single province, and a single reign, far exceeded that of the primitive martyrs in the space of three centuries, and of the Roman empire."

Whilst some have diminished the number of Christian martyrs far below the standard of truth; others have probably erred as much in the other extreme.

F. Ruinart, (in the preface to his "Selecta et Sincera Martyrum Acta. Amst. 1713,) endeavours to prove, that the catalogue of martyrs is not at all swelled; that the carnage was immense under the first emperors, and especially in the time of Diocletian. F. Papebroch, in his "Acta Sanctorum," also makes the number of martyrs immense. The truth lies probably between the extremes.

The martyrs were less in number than several of the ancient and modern writers have supposed them to be, but much more numerous than Dodwell and his followers are willing to believe; and this medium will be easily admitted by such as have learned from the ancient writers, that, in the darkest and most calamitous times of the church, all Christians were not equally or promiscuously disturbed, or called before the public tribunals. Those who were of the lowest rank of the people escaped the best; their obscurity, in some measure, screened them from the fury of persecution. The learned and eloquent, the doctors and ministers, and chiefly the rich, for the confiscation of whose fortunes the rapacious magistrates were perpetually gaping, were the persons most exposed to the dangers of the times. Mosheim's Eccl. Hist. vol. i.

There is scarcely any faith or religion that does not pretend to its martyrs: Mahometans, heathens, idolaters, &c. all have their martyrs.

In the ancient church, the acts, sayings, sufferings, and deaths of the martyrs, were preserved with great care, in order to be read on certain days, and thus proposed as models to future ages: and yet, notwithstanding all this diligence, we have but very little left of them: the greatest part of

them having been destroyed, during that dreadful persecution, which Dioclesian carried on for ten years, with fresh fury, against the Christians: for a most diligent search was then made after all their books and papers; and all of them that were found were committed to the flames. Eusebius, indeed, composed a martyrology, but it never reached down to us; and those since compiled are extremely suspected.

From the eighth century downwards, several Greek and Latin writers endeavoured to make up the loss, by compiling, with vast labour, accounts of the lives and actions of the ancient martyrs: but most of them have given us little else than a series of fables, adorned with profusion of rhetorical flowers, and striking images, as the wifer, even among the Romish doctors, frankly acknowledge. Nor are those records, that pass under the name of Martyrology, worthy of superior credit, since they bear the most evident marks both of ignorance and fallshood.

MARTYRS, *Era of*, is an era followed in Egypt and Abyssinia, and which even the Mahometans, since their becoming masters of Egypt, frequently observe. See ΕΡΟΧΙΑ.

The era of martyrs is also called the era of Dioclesian.

MARTYRS, *Knights of the*, in Palestine and Jerusalem, or of St. Cosmo and Damian, an order which, according to Giustiniani, was instituted in the 10th century, and afterwards approved and confirmed by pope Jean XX. in the year 1024. The badge of this order is said to have been a red cross, formed of four equal shafts, the centre thereof charged with the figures of the saints Cosmo and Damian, placed within a circle. But Giustiniani is charged with having converted the religious order of canons regular of the Penitence of the Martyrs, who wear a red cross on their white habit, into an order of knighthood.

MARTYR'S Reef and Shoals, in Geography, a rocky shoal between the gulf of Mexico, on the N. side of the Florida stream. N. lat. 24° 5'. W. long. 81°.

MARTYROLOGY, from μαρτυρ, *witness*; and λεγω, *I speak*, or λεγω, *colligo*, *I gather*; a register or catalogue of martyrs.

A martyrology, properly speaking, should contain no more than the name, place, and day of martyrdom of each saint; but the term is frequently extended to the histories of martyrs. The custom of collecting martyrologies is borrowed from the heathens, who inserted the names of their heroes in their Fasts, to preserve to posterity the memory and example of their noble actions. Baronius gives pope Clement the credit of being the first who introduced the custom of collecting the acts of the martyrs.

The martyrology of Eusebius of Cæsarea was the most celebrated in the ancient church. It was translated into Latin by St. Jerom; but the learned agree that it is not now extant. That attributed to Beda, in the eighth century, is of very doubtful authority; the names of several saints being there found, who did not live till after the time of Beda. The ninth century was very fertile in martyrologies; then appeared that of Florus, subdeacon of the church at Lyons; who, however, only filled up the chasms of Beda. This was published about the year 830, and was followed by that of Waldenburtus, monk of the diocese of Treves, written in verse about the year 848, and this by that of Ufuard, a French monk, and written by the command of Charles the Bald, in 875, which last is the martyrology now ordinarily used in the Romish church. That of Rabanus Maurus is an improvement on Beda and Florus, written about the year 845; that of Notker, monk of St. Gal, was written about the year 894.

The martyrology of Ado, monk of Ferrieres, in the diocese of Treves, afterwards archbishop of Vienne, is a descendant

scendant of the Roman; if we may so call it; for Du Sollier gives its genealogy thus: the martyrology of St. Jerom is the great Roman martyrology; from this was made the little Roman one, printed by Rosweyd; of this little Roman martyrology was formed that of Beda, augmented by Florus. Ado compiled his in the year 858. The martyrology of Nevelon, monk of Corbie, written about the year 1089, is little more than an abridgment of that of Ado; father Kircher also makes mention of a Coptic martyrology, preserved by the Maronites at Rome. We have also several Protestant martyrologies, containing the sufferings of the Reformed under the Papists; viz. an English martyrology, by J. Fox; with others by Clark, Bray, &c.

MARTYROLOGY is also used, in the *Romish Church*, for a roll or register kept in the vestry of each church, containing the names of all the saints and martyrs, both of the universal church, and of the particular ones of that city or monastery.

MARTYROLOGY is also applied to the painted or written catalogues in the Romish churches, containing the foundations, obits, prayers, and masses to be said each day.

MARTZIAN, in the *Materia Medica*, a word formed by the modern Greek writers, to express a sort of seaplant, growing upon the rocks, and used in painting, dyeing, &c.

The word is formed of the Arabian name *margian*, by changing the *g* into *tz*.

MARU, in *Botany*, a name by which *Dodonæus*, and some others, have called the *cerinthe*, or *honey-wort*.

MARU, or MARU-Shah-Jan, in *Geography*, a town of Persia, in the province of Khorasan, on the river Morga; formerly a magnificent city, and the residence of many sultans; but desolated by the Turcomans in the twelfth century; 200 miles N. of Herat. N. lat. 38° 42'. E. long. 61° 12'.

MARU-errud, or MARU el Roud, a town of Persia, in the province of Khorasan, on the Morga, founded, as some say, by Alexander the Great; 125 miles N.E. of Herat. N. lat. 37° 36'. E. long. 61° 18'.

MARVAGLIA, a town of Italy, in the bailiwick of Bellinzona.

MARVAO, a town of Portugal, in Alentejo; six miles S.E. of Castello de Vide. N. lat. 39° 13'. W. long. 7° 2'.

MARUBIUM, in *Botany*, &c. See MARRUBIUM and HOREHOUND.

MARUDO, in *Geography*, a country of the island of Borneo, which advances towards the north between four great points, of which the first, called Sanfaon, is at the distance of 11 Dutch miles from the second, denominated Tandjong Mater; after which follows the bay of Marudo, with a town of the same name situated at its bottom. At some distance from the shore are discovered four large isles, and some smaller. The two other points on the E. of the bay are Pulo Avigo and Punta Corpaon, between which there are some little isles. From this last point the coast bends to the east, and forms a large bay, called that of St. Ann. The country of Marudo is remarkable for forests and mountains; one of the latter, on the S. of the town of Marudo, called by the Portuguese and Dutch the mountain of St. Peter, is of prodigious height. In these wild countries monkies are very numerous, besides the "orang-outang;" and in the bodies of these monkies are found the best bezoar.

MARVEJOLS, a town of France, and principal place of a district, in the department of the Lozère; nine miles W. of Mende. The place contains 3611, and the canton

8823 inhabitants, on a territory of 222½ kilometres, in ten communes. N. lat. 44° 33'. E. long. 3° 22'.

MARVEL of PERU, or *Four-o'clock Flower*. See MRABILIS.

MARVELL, ANDREW, in *Biography*, a political writer of considerable eminence, was the son of a clergyman, and born at Kingston-upon-Hull, in the year 1620. He was sent to Cambridge at the expence of the corporation of Hull, and was entered a student of Trinity college in 1635. His fine talents rendered him an object for the tempting arts of the Jesuit emissaries, then perpetually lurking about our universities, and they so far succeeded in their proselyting attempts as to induce him to quit his college and go to London, where he was accidentally found by his father in a bookseller's shop. He was persuaded by his parent to return to Cambridge, and serious reflection upon the dangers which he had thus escaped, seems to have left upon his mind a rooted aversion from that system of religion which could make use of such vile arts to extend its progress. His father was unfortunately drowned as he was crossing the Humber, in 1640, and Andrew took possession of his small inheritance. This might be the occasion of some inattention, on his part, to the duties of academical life, for it appears that in the following year he, with some other young men, were excluded from their college for non-attendance. Perhaps, however, he had then begun the course of travels which he pursued through Holland, France, and Italy. He had ever a great propensity to ridicule, and it was first publicly displayed by a satire upon Flecknoe, an English priest and poetaster at Rome; and next in a burlesque poem addressed to an abbot de Maniban, at Paris, a pretender to fortune-telling. Of the residence and pursuits of Andrew Marvell, for many subsequent years, little is known. In 1653, he was engaged by the protector Oliver Cromwell, to superintend the education of a Mr. Dutton. It was not till four years after this, that he took any part in public affairs, when, he says, he entered into an employment for which he was not altogether unfit, and which he considered to be the most inoffensive towards his majesty's concerns, of any in that usurped and irregular government. This alluded to the post of assistant to Milton in the office of Latin secretary, which he held till the death of Cromwell. In the parliament of 1660, Marvell sat as one of the representatives of the borough of Hull, an honour which was conferred upon him to the end of his life. He is supposed to have been one of the last persons who received a pension from his constituents, which he earned by the diligence, firmness, and integrity with which he discharged his duty. At the beginning of the new reign he paid little or no attention to the duties of parliament, and in 1661, and the following years, he was absent in Holland and Germany, and upon his return he accompanied lord Carlisle, the ambassador-extraordinary to the northern courts, as his secretary. In 1665, he renewed a constant and uniform attendance on parliament, and from this period to 1674, he made a regular report of the proceedings of both houses to the mayor and corporation of Hull. The whole efforts of Andrew Marvell, in and out of parliament, were directed to the preservation of civil and religious liberty. He was not a powerful nor a frequent speaker, but his influence over the members of both houses was considerable. By his writings he obtained the character of the witty man of his time, and was of great service to the cause which he espoused. In 1672, Dr. Parker, afterwards bishop of Oxford, published a work of bishop Bramhall's, to which he prefixed a preface of his own, maintaining the most extravagant positions concerning the rights of sovereigns over the consciences.

sciences of their subjects. Marvell immediately attacked him in a work, entitled "The Rehearsal Transposed," which, with a profusion of witty sarcasm, contains much solid argument, and may be reckoned one of the ablest exposures of the maxims of religious tyranny. Marvell was author of several other works, of which we may notice "A Reasonable Argument to the Grand Juries of England to petition for a New Parliament." His last piece was entitled "An Account of the Growth of Popery and arbitrary Power in England." This was so very offensive to the persons in power, that an advertisement was issued in the Gazette, offering a reward for the discovery of the printer, publisher, and author of it. Notwithstanding the acrimony with which our patriot attacked the court and its plans, Charles II. delighted in his conversation, and his ministers took every means in their power either to gain him over to their party, or at least to silence him. A remarkable anecdote on this subject is related. One morning, after he had been the preceding evening familiarly entertained by his majesty, the door of his apartment, up two pair of stairs, in a court in the Strand, was suddenly opened by the lord-treasurer Danby. Marvell, who was writing, being surprized, asked his lordship if he had not mistaken his way. "No," replied the courtier, "now I have found Mr. Marvell;" and he proceeded to say he had been sent by his majesty to know in what manner he could serve him. Marvell rejected every offer, though his lordship was commissioned to present him with a thousand pounds. At the moment that he thus nobly asserted his independence, he was so destitute as to be obliged to borrow a guinea of a friend to supply the necessary demands of life. Well might his biographer say, that "of all men in his station, he is the person who ought to be selected as an example of genuine independence produced by the philosophical limitation of wants and desires. He was not to be purchased, because he wanted nothing that money could buy, and held cheap all titular honours in comparison with the approbation of his conscience, and the esteem of the virtuous." He died in 1678, and was buried in the church of St. Giles's-in-the-Fields; and the corporation of Hull, in gratitude for his services, defrayed the expences of his funeral, and raised a monument to his memory. His works were published in two volumes, 12mo., in 1726, and a more complete edition was given to the public in 1776, with a new life of the author, by Capt. Edward Thompson, in three volumes, quarto, to which our readers are referred.

MARVELLA in *Geography*, a town of Spain, situated in a bay on the sea-shore, three leagues from Malaga, at the foot of some arid mountains, and containing 1100 inhabitants. From the number of houses fallen into ruins, and the extent of the walls, part of which still remain, and are more than a mile in circumference, we might infer that the population has been much greater. The sea is on the S., and on the N. the mountains of Marvella, on which a few vines are planted. This town has one parish-church, two monasteries, a hospital, two schools, a mansion-house, and a prison. On the shore a bastion, mounted with two pieces of ordnance, is erected for the defence of the bay, where no large ship can cast anchor; on the E. and W. sides of the town are some kitchen-gardens. The inhabitants derive their subsistence from fishing, and the produce of a limited agriculture. They also employ twenty barks in conveying leather, charcoal, wood, wine, dried raisins, and black-stone, &c. to Cadiz, Malaga, and Ceuta. To these they may sometimes add the juniper-berries, which the mountains furnish in great profusion, and of which the English consume great quantities in their dyes.

MARUGGIO, a town of Naples, in the province of Otranto; ten miles S.S.W. of Oria.

MARVILLE, a town of France, in the department of the Meuse; six miles S.E. of Montmedy.

MARULLUS, MICHAEL TARCHANIOTES, in *Biography*, a learned modern Greek, a native of Constantinople, which city he abandoned at its capture by the Turks in 1453, and retired to Italy. He was engaged in the military service, though a steady adherent to polite literature. He enjoyed the patronage of several persons of high rank, and was for a time liberally entertained by Lorenzo de Medici. He married the learned Alexandra Scala, of Florence, a circumstance that involved him in a bitter quarrel with Politian, who was her admirer. Marullus was engaged in several other controversies with men of learning, which he brought on himself by his censures of the ancient Latin poets, and his high notions of his own merits. He lost his life in the year 1500, while attempting to cross the little river Cecina, in Tuscany. His "Latin Poems," which have been frequently republished, consist of four books of Epigrams, and four of Hymns, with a fragment of a Poem on the education of princes. He was reckoned a good imitator of Lucretius, who was the principal object of his admiration among the ancients, and of whom he gave an edition. There was another poet of Calabria of this name, in the fifth century, who wrote a panegyric on Attila, king of the Huns, which the barbarian required by causing the poet and his poem to be burnt together. Moreri.

MARUM, in *Botany*. See ORIGANUM, SALVIA, TEUCRIUM, and THYMUS.

MARUT, in *Hindoo Mythology*, is a personification of the wind, more commonly called *Pavana*, under which article we shall more particularly describe this potent deity. The Maruts are frequently alluded to in Hindoo books, as the genii or regents of the winds, of whom Pavana is the chief. Eight are usually spoken of, and they then seem to correspond with the guardians of the cardinal and intermediate points, into which the Brahmins have arranged the heavens; reminding us, under this division, of the octagonal temple of the winds at Athens. These eight guardians or regents are, 1. Indra, who being esteemed as the first of firmamental deities, and ruler of the east, that point is reckoned first; and proceeding: 2d. Pavaka, the god of fire, rules the south-east: 3. Yama, king of death and judge of hell, over the south or lower region: 4. Nirit or Nairit, south-west: 5. Varuna, regent of waters, west: 6. Pavana, otherwise called Vayu, north-west: 7. Kuvera, the god of wealth, the north: and 8. Ifani, a name and form of Siva, rules the north-east. Some mention is made of these several deities and powers, under their respective names. Female divinities seem also to have dominion over the points of the heavens, as noticed under MATRI.

It is not always, however, that we find this arrangement, although it be the most usual, followed by Hindoo writers. Other deities are sometimes substituted, and their guardianships altered. Sir William Jones has addressed a spirited hymn to Indra, in which a stanza is introduced descriptive of a poetical co-operation of these powers, in aid of their chief Indra, the god of showers. (See INDRA.) It is borrowed from the popular mythology of Nepaul and Thibet, and we will extract the stanza, as descriptive of Hindoo mythological poetries; premising that it relates to a freak of Indra, who is fabled to have assumed the form of a shepherd's boy, that he might the easier steal from a garden some pomegranate blossoms, to deck the dark tresses of his virtuous consort *Indrani*; which see.

“ — The reckless peasant, who these glowing flowers,
 Hopeful of rubied fruit, had foster'd long,
 Seiz'd, and with cordage strong,
 Shackled the god who gave him showers.
 Straight from seven winds immortal genii flew—
 Varuna green, whom foamy waves obey;
 Bright Vahnî, flaming like the lamp of day;
 Kuvera, fought by all, enjoy'd by few;
 Marut, who bids the winged breezes play;
 Stern Yama, ruthless judge! and Isâ cold;
 With Nairit, mildly bold:
 They, with the ruddy flash that points his thunder,
 Rend his vain bands asunder.
 Th' exulting god resumes his thousand eyes,
 Four arms divine, and robes of changing dyes.”

MARUTY is a name of Hanuman, who, although an ape only in appearance, is yet, in the sacred romances of the poetical people of the East, a very important personage; and of whom almost if not fully as much is said and sung as of any deity in their monstrous, although certainly curious, Pantheon. In their theogonies he is called the son of Siva, who miraculously impregnated the mother in a manner corresponding with the usual whimsicality of these tales, if literally received: but popularly he is deemed the offspring of Pavana, the regent of the wind, otherwise called *Marut*, which see, and hence his name, which means windy. Hanuman means with bloated cheeks.

This simian hero was produced with a vast number of others by the celestials for the purpose of assisting Rama in his conquest of Lanka from the tyrant Ravana; which conquest is the theme of that singular poem the *Ramayana*, as noticed under those several articles. Sir William Jones, hinting at the similarity of the Indian conquests of Dionysos and Rama, whose armies of Satyrs were respectively led by Pan, and the son of Pavan, finds farther coincidences of character, both in the principals and their general. Pan improved the pipe by additional reeds; Hanuman was also a musical genius, and one of the four systems of Hindoo music is named after him. In the peninsula of India, and on Ceylon, or Lanka, statues, pictures, legends and romances of Hanuman are very common. He is also seen on very ancient coins and medals, of which exact representations are given in plate 104 of Moor's Hindoo Pantheon; and many, in other plates of the subject of this article, with sundry legends respecting him and his history, that however admissible in such a work, would be evidently misplaced in this. His building of Rama's bridge between the continent and Ceylon, and some other points concerning him, are noticed under LANKA. Maruti or Hanuman is represented sometimes wholly as a monkey; at others as a man with a monkey's head, and perhaps tail; and with from one to four pair of arms, holding divers weapons, or as a respectful attendant on Rama, who is seldom seen without him.

MARWICK HEAD, in *Geography*, a cape of Scotland, on the W. coast of the island of Pomona. N. lat. 52° 58'. W. long. 3° 10'.

MARY, the mother of our Saviour Jesus Christ, in *Scripture Biography*, was the daughter of Joachim and Anna, and espoused to Joseph before the conception and birth of Christ; so that our blessed Lord was by his mother of the tribe of Levi, and by his legal and reputed father Joseph, of the tribe of Judah.

Of the parents of Mary, we have no information in scripture, not so much as of their names, unless Heli, mentioned by St. Luke iii. 23, be the same with Joachim; and therefore, for the birth of Mary, and for an account of her

parents, we are under a necessity of having recourse to some ancient apocryphal writings. It is of principal importance to know, that she was of the royal race of David, and she was also akin to the race of Aaron; since Elizabeth, the wife of Zacharias, was her cousin. See Luke i. 27. 32, 33. 36.

As the time of Mary's delivery approached, Cæsar Augustus issued an edict, commanding the subjects of the empire to register their names, according to their families, in their respective cities. Joseph, though he was not rich, and though he lived in Galilee, might have some small inheritance in or near Bethlehem, and might be obliged to go thither upon that account. St. Luke gives us this reason of his going to Bethlehem, "because he was of the house and lineage of David," (ch. ii. v. 4.) It is probable, says Lardner; that this journey was owing to the custom of the Jews; who, whenever they were numbered, entered themselves according to their tribes and families. Mary accompanied him on this occasion, more perhaps from choice than from any legal necessity; or for some sufficient reasons with which we are not acquainted. Whilst they remained at Bethlehem, our Saviour was born in the circumstances recited by the evangelists. (Luke ii. Matt. ii.) Of her visit to Jerusalem, at the time of her purification and of her presentation of Jesus in the temple, and of other incidents that occurred in the early period of our Saviour's life, it is sufficient to refer to the evangelical history. We find that Mary was present at the marriage of Cana, in Galilee, where our Lord performed his first public miracle (John ii. 1, 2, &c.), and that she accompanied her son to Capernaum, where she seems to have chiefly resided. Epiphanius, however, intimates, that she followed him every where during the whole course of his public ministry; but if that was the case, it is not recorded by the evangelists. We find her at Jerusalem at the last passover which our Saviour attended; and she followed him to Calvary, where she stood at the foot of his cross, and where she was recommended by him, with an attention highly worthy of the dignity of his person, and excellence of his character, to the care of his beloved disciple, who from that hour took her to his own house. Our Saviour appeared to her after his resurrection, and she was one of the first to whom he vouchsafed this honour and consolation; she was also with the apostles at the time of his ascension, and continued with them at Jerusalem. (Acts i. 14.) After this, she dwelt in the house of St. John the Evangelist, who took care of her as of his own mother. As St. John staid for a considerable time in Palestine, it may be reasonably concluded, that Mary, our Lord's mother, did not go with him to Ephesus, as Baronius and some others have thought, but died before he went thither, according to the opinion of Cave and Basnage; and was buried at Jerusalem.

Theophylact says, that Joseph had by the widow of his brother Cleophas, who died without issue, six children, four sons and two daughters, named Mary, and he supposes Mary, mother of our Lord, to be the same as Mary the mother of James and Joses, who were Joseph's children by a former wife; as was also Salome, the mother of Zebedee's children. And whereas, in John xix. 25, mention is made of Mary wife or daughter of Cleophas, and sister to our Lord's mother, he says, that by "sister" must be there understood "relation," for that Mary is supposed to be daughter of Cleophas, brother of Joseph, whose widow he had married. He says, that there are four Mariæ mentioned in the gospels; viz. our Lord's mother, Mary Magdalene, Mary daughter of Cleophas, and the sister of Lazarus. Gregory Nyssen says, that three Mariæ are mentioned as standing at the foot of the cross of Jesus, Mary our Lord's

Lord's mother, Mary wife of Cleophas, and Mary Magdalene. (John, ubi supra.) For Mary mother of James, or mother of James and Joses, as mentioned by the other evangelists, he cannot but think to be the same with our Lord's mother; James and Joses, he supposes, to be children of Joseph, whom he had by a former marriage. Lardner's Works, vols. iv. v.

MARY *Magdalene* has been supposed by many to be the person called a "Sinner" in the seventh chapter of St. Luke's gospel; but Dr. Lardner has adduced a variety of circumstances in his "Letter to Jonas Hanway, esq." which make it very probable, that Mary Magdalene was not the person to whom the evangelist there refers; and he therefore objects to the appellation *Magdalen House*, as appropriated to an asylum for penitent prostitutes. Mary Magdalene was so called, probably from *Magdala*, the place of her nativity, a town situated somewhere beside the lake, and mentioned Matt. xv. 29; whereas it appears from the history in Luke (verse 27.) that the woman there mentioned was of the city, in which our Lord then was; which city was Capernaum or Naim; and there is no reason for believing that Mary Magdalene resided at either of those places. Another passage (Luke viii. 1, 2, 3.) affords additional reasons for supposing that Mary Magdalene is not the woman intended in the preceding chapter. This Mary appears to have been a woman of high station and opulent fortune, not likely to have been designated under the description of "a woman in the city which was a sinner;" she is mentioned by St. Luke before Joanna, the wife of Herod's steward; and, besides, when the other evangelists have occasion to speak of our Lord's female friends, they commonly assign the first place to Mary Magdalene. (See Matt. xxvii. 56. 61. xxviii. 2. Mark xv. 40. 47. Luke xxiv. 10.) Grotius thinks, that it was at her expence the spices were bought for embalming the body of Jesus. This precedence, as Lardner suggests, might have been, partly, owing to her age. Mary Magdalene is mentioned as a person who belonged to those who were called *dæmoniacs*. She is also mentioned with divers other honourable women, who attended our Lord in his journies, and ministered to him of their substance. And it is justly questioned, whether our Lord would have allowed of that, if Mary's conduct had been disreputable in the former part of her life; nor can we reasonably imagine, that any women of distinction and good credit would admit into their society one who had been under the reproach of a disorderly life. Among these women was our Lord's mother; and undoubtedly an exact decorum was observed, according to the Jewish custom. Moreover, Mary Magdalene seems to have presided in the direction of the affairs, which were under their care. On the other hand, the woman called a "Sinner," was absolutely excluded from having any part in that company. (Luke vii. 47, 48. 50.) "I conceive of her," says the judicious and candid Lardner, "as a woman of a fine understanding, and known virtue and discretion, with a dignity of behaviour becoming her age, her wisdom, and her high station; by all which she was a credit to him whom she followed as her master and benefactor. She shewed our Lord great respect in his life, at his death, and after it; and she was one of those to whom he first shewed himself after his resurrection. See Matt. xxviii. 1—10. Mark xvi. 9. John xx. 1—18.

Some have supposed, that Mary, sister of Martha and Lazarus, was the same as Mary Magdalene. Dr. Lardner refuses this opinion, by alleging, that Mary Magdalene derived her name from a place in Galilee; whereas Lazarus and his sisters were inhabitants of Bethany near Jerusalem;

Mary Magdalene is frequently named with other women, who attended our Lord in his journies, and came up with him from Galilee to Jerusalem, at the times of the great feasts; whereas Lazarus and his sisters resided at Bethany; and Mary Magdalene is particularly mentioned with others, whom our Lord had miraculously healed of infirmities; but nothing of a like kind is ever said, or hinted of Mary, sister of Lazarus. We shall here add, that Mary, sister of Lazarus, does not seem to have been the woman described by St. Luke as a "Sinner." Lardner's Works, vol. xi.

MARY I. queen of England, in *Biography*, daughter of Henry VIII., by Catharine of Arragon, was born in 1516. In her infancy she was betrothed to three different persons, first, to the dauphin of France; next, to the emperor Charles V., and afterwards, to the duke of Orleans. These alliances did not take place, and after her mother's death Mary was excluded from the succession to the crown, as illegitimate. In 1544 she was restored to her right, but her illegitimacy was not reversed; and Henry, though by this act he opened the way for the princesses to mount the throne, would not allow the former acts to be reversed; he even obliged his parliament to confer upon him a power of full excluding the two sisters, Mary and Elizabeth, if they refused to submit to any conditions which he, at any time, should be pleased to impose: and he farther required them to enact, that, in default of his own issue, he might dispose of the crown as he pleased, either by will or letters patent. Mary, bred up by her mother in a zealous adherence to the Roman Catholic faith, reluctantly subscribed to her father's supremacy on his breach with the papal see; and when, upon the accession of her brother Edward VI., the reformation was introduced into the English church, she refused, though strongly urged and menaced, to comply with the new worship, and obtained a connivance through the interference of her kinsman the emperor. "As intolerance," says one of this princess's biographers, "was no less the character of the new than it had been of the ancient religion, Mary was again molested; her chaplains were thrown into prison; urgent remonstrances were made to her without shaking her firmness; and finally, her brother was, with great difficulty, persuaded still to indulge her in her nonconformity."

On the death of Edward in 1553, we have already seen, in the several articles relating to this period of our history, that an attempt was made to exclude both Mary and Elizabeth from the crown, by setting up lady Jane Grey, the failure of which effort has been before noticed. Mary now, by the loyalty of her subjects, was, without a contest, placed upon the throne, and her title universally recognized. She soon displayed a passionate zeal for the restoration of the Catholic religion: her temper was sour and gloomy, and she inherited too much the wilfulness and despotic humour of her father. She almost immediately re-instated those bishops who, in the late reign, had been deprived of their sees for their adherence to popery, while Cranmer was indicted for the crime of high-treason, and several Protestant bishops were thrown into prison. The next step that outraged the feelings, and cast down the spirits of those who adhered to the Protestant faith, was her marriage to the archduke Philip, son of the emperor Charles V. Previously to this a complete restoration of the Catholic worship took place throughout the kingdom, and all the clergy who refused to comply with it were ejected from their livings. These changes, which were regarded as preludes to still more arbitrary and cruel measures, occasioned a vast number of discontents, that broke out into insurrections in Devonshire and Kent. In the former, Carew was the leader, in the latter

latter Wyatt: these were soon suppressed, and they only served as pretexts for new severities. The princess Elizabeth, who was an object of peculiar hatred to her sister, on account of her attachment to the principles of the reformers, was thrown into the Tower, and lady Jane Grey, with her unfortunate husband, whose lives had hitherto been spared, were executed. Philip, who had long been expected by the queen, arrived in England in July 1554, and the nuptials were consummated. The ruling passion of this prince was ambition, which his consort was desirous of gratifying. She had, at this period, another object in view, in the pursuance of which she was quite successful; this was that of reconciling the kingdom to the pope, which was effected in great form by means of the legate, cardinal Pole. The sanguinary laws against heretics were renewed, and it was determined, in council, to put them into execution. The merciless scenes of cruelty which followed this resolution, have deservedly stamped the peculiar character of this reign, and indelibly fixed upon the sovereign, the hateful, but well-merited epithet, of *bloody* queen Mary. From various disappointments which she met with, as well in the want of a family, as in her husband's inattention, and in the discontents of her subjects, it has been questioned whether the period of her short reign was more afflictive to herself, or disastrous to the nation. It is to the honour of the legate Pole, that he totally disapproved of the severity of persecution, but the arguments of Gardiner and others in its favour were so conformable to the queen's disposition, that the flames soon began to be kindled in the metropolis and other parts of the kingdom. Protestants, illustrious for their talents, and of the purest moral character, were called upon to seal their faith at the stake. For an account of the sufferings which this cruel woman inflicted, and of the martyrs which she sent to prison, to exile, and death, we refer to the several articles in the work, which have been devoted, as far as the writers have been able, in a short compass, to keep them in "everlasting remembrance." In the space of less than four years, 277 persons were committed to the flames, including prelates and beneficed clergymen, laymen of all ranks, women, and even children. It is believed, that neither shame nor compassion, nor a regard to her future reputation, ever touched the heart of queen Mary. It might not, perhaps, occur to her that by her dark deeds she was raising a name, that should, to the last records of her country, be held in abhorrence by persons of all ranks and parties; and that the lisping infant should, in almost their earliest lessons, learn to dread the sound of "the bloody queen." The sincerity of her zeal has been referred to as an extenuation of her crimes, and we would not withhold from her any trait that might tend to make her a less hateful object with posterity: she evidenced that sincerity by the sacrifices which she was ever ready to make of the revenues of the crown, in restitution of the goods of the church, and more than once, to the remonstrances on this head, she replied, in words to the following effect, "that she preferred the salvation of her soul, to ten such kingdoms." To gratify Philip, she warmly promoted a war with France, in conjunction with him, though contrary to the terms of the marriage articles, and the manifest interests of the English nation. War was declared in 1557, and the assistance of the English troops contributed to the victory over the French at St. Quintin. In the following year, the loss of Calais more than overbalanced any successes that might be achieved in other parts. This town was taken by the duke of Guise in the winter of 1558, after it had been more than 200 years in the possession of England. The disgrace of this circumstance sunk deep into the heart of the

queen, who had been, some time before, in a declining state of health, occasioned by a dropical complaint: and she expired in the month of November 1588, in the forty-second year of her age, and the sixth of her reign. With her expired the dominion of popery in this kingdom, which could never overcome the horror and detestation which her cruelties had inspired. "It is not necessary," says the historian, "to employ many words in drawing the character of this princess. She possessed few qualities either estimable or amiable, and her person was as little engaging, as her behaviour and address. Obstinacy, bigotry, violence, cruelty, malignity, revenge, tyranny; every circumstance of her character took a tincture from her bad temper and narrow understanding. And amidst that complication of vices, which entered into her composition, we shall scarcely find any virtue but sincerity; a quality which she seems to have maintained throughout her whole life; except in the beginning of her reign, when the necessity of her affairs obliged her to make some promises to the Protestants which she certainly never intended to perform. But in these cases a weak bigotted woman, under the government of priests, easily finds casuistry sufficient to justify to herself the violation of a promise. She appears also, as well as her father, to have been susceptible of some attachments of friendship; and even without the caprice and inconstancy which were so remarkable in the conduct of that monarch. To which we may add, that in many circumstances of her life she gave indications of resolution and vigour of mind, a quality which seems to have been inherent in her family." Hume's Hist. 8vo. vol. iv.

MARY DE MEDICIS, daughter of Francis II., grand duke of Tuscany, and wife of Henry IV. of France, was born at Florence in 1573. On the death of her husband, in 1610, she was appointed regent of the kingdom, in which character she displayed great political intrigue, and planned projects of unbounded ambition. Differences arose between her and Lewis, which were compromised by means of Richelieu, whom she introduced to the favour of the monarch. But afterwards a violent breach occurred between her and the cardinal, who was supported by the king. By her intrigues, the nation lost all its influence abroad, and was torn to pieces at home by contending factions. After several vicissitudes of fortune, she was abandoned by her son, Lewis XIII. whose reign had been constantly disturbed by the civil commotions that she had occasioned, was exiled to Brussels, and all her favourites, even her physician, were either banished or sent to the Bastille. She died in poverty in the year 1642. She built the superb palace of Luxembourg at Paris, and embellished that city with aqueducts and other ornaments. Hist. of France, 8vo. 1790.

MARY, queen of Scotland, daughter of James V., was born in the royal palace of Linlithgow, on the 8th of December, 1542. Her mother was Mary, the eldest daughter of Claude, duke of Guise, and widow of Louis, duke of Longueville. Her father dying a few days after her birth, she scarcely existed before she was hailed queen. After the rejection of a proposal made by Henry VIII. of England to contract her to his son Edward, an offer was made by the Scots to marry her to Francis, the dauphin son of Henry II. of France, and in her sixth year she was sent into that country for education. She displayed, on advancing to maturity, a degree of personal beauty which was the admiration of a gay and galant court. The opening powers of her mind also, and her natural disposition, afforded early hopes of capacity and merit. After being taught to work with her needle, she was instructed in the Latin language; and is said to have read and spoke it with accuracy and fluency.

In the several modern languages her proficiency was still greater, and she spoke the French, the Italian, and the Spanish tongues, with ease and propriety. She walked, danced, and rode with enchanting gracefulness, and she was qualified by nature, as well as by art, to attain to distinction in painting, poetry, and music. When she had completed her fifteenth year, the negotiations for her marriage were entered upon. It was the object of the French court to obtain by this union that ascendancy over Scotland which the prudent jealousy of the Scots attempted to guard against. Her nuptials with the dauphin were celebrated with great pomp in 1558, and her husband received the "crown matrimonial" of Scotland. On the accession of Elizabeth to the throne of England, Mary was obliged by her ministers to put in her claim to that dignity, on the plea of Elizabeth's illegitimacy, and she and the dauphin openly, and for a short time, assumed the title and arms of king and queen of England. This fatal step entailed upon her the perpetual hatred of her rival, queen Elizabeth, and was the principal cause of all her misfortunes. In 1559, the death of Henry II. raised his son, Francis II., to the throne of France, and conferred upon Mary the crown of a queen-consort of that powerful kingdom. Her mother, who had acted as regent, died in 1560, while that country was involved in a war between the Protestants, supported by queen Elizabeth, and the Catholics, aided by France. Peace between England and France succeeded her death, by an article of which Francis and Mary were bound to recognize Elizabeth's title to the English crown, and renounce their own. In a very few months Francis died, leaving his widow overwhelmed with sorrow for the loss of that influence which she possessed as his queen. Her humiliation, the disgrace of her uncles, the princes of Lorraine, which instantly followed, and the coldness of Catharine of Medicis, the queen-mother, who governed her son Charles IX., plunged Mary into inexplicable sorrow. She was invited to return to her own kingdom, and she endeavoured to reconcile herself to her fate. She was now to pass from a situation of elegance and splendour to the very reign of uncivilization and turbulence, where most of her accomplishments would be lost, and none of them could be properly appreciated. Among the Scots of that period, elegance of taste was but little known: the generality of the people were sunk in ignorance and barbarism, and what was denominated religion, dictated to all a petulant rudeness of speech and conduct to which the queen of France was wholly unaccustomed. At length, however, though much against her inclination, she embarked, bidding farewell, with sighs and tears, to the beloved land which had so long fostered her, nor could she be prevailed on to quit the deck till its coasts were quite out of view. She arrived in Scotland in August 1561, after an absence of almost thirteen years.

It cannot be expected, that in the limits to which this article must necessarily be kept, that we can enter into all the controversy to which the history of this queen has given rise. It will be sufficient for the readers of the Cyclopædia, if we give a concise narrative of undisputed and indisputable facts, following, in a great measure, Dr. Robertson as our guide.

When the queen arrived, the Protestant cause in Scotland was espoused by the majority of the people, but had not as yet obtained an establishment, and its adherents were full of suspicions of the machinations of the popish party, supported by the court of France, and by the secret attachment of Mary, who was zealously devoted to the Catholic religion. The Protestant leaders looked to Elizabeth as the great protectress of their principles, and she took every opportu-

nity to undermine the influence of Mary, and involve her in difficulties; not only on account of her predilection for the French alliance with her country, but because Elizabeth regarded her as a personal rival and a claimant of her crown. On this and on various other accounts, though the reception of Mary was for the moment highly flattering, and seemed to denote an universal spirit of loyalty, abundant sources existed of impending disturbances. The commencement of her administration was prudent and moderate. Although the zeal of the reformers insulted her religion, she would not listen to the violent counsels of the popish faction, but gave her confidence entirely to the Protestants. She repressed the outrages of the banditti of the borders, and made a progress into the north, with the view of remedying the disorders there. Her appearance gave so much alarm to the powerful earl of Huntley, that he took up arms, and Mary, with her ministers who attended her, was brought into great danger, from which she was rescued by the loyalty of some Highland clans. The earl was afterwards defeated and slain by Mary's natural brother, the earl of Murray. Her people were now anxious that she should enter upon a second marriage, and various matches were proposed to her by foreign potentates. Her choice fell upon her kinsman Henry Stuart, lord Darnley, son of the earl of Lennox, a youth who, besides a fine person, did not possess a single valuable qualification. This match was opposed by many of her powerful nobles, but through the address of the queen, the consent of the nation in general was obtained, and the union took place in 1565. She proclaimed her husband king, and commanded that all writs should run in their joint names, and she began to devise means to revenge herself on those who had opposed her marriage. These were the chiefs of the Protestant party; in her own mind she would have exercised clemency towards them, but the solicitations of the French court, then engaged in a league with Spain to extirpate heresy, induced her to change her intentions. She called a parliament, in which their attainer, and some measures in favour of the Catholic religion in Scotland, were to be proposed, when a circumstance occurred, which for a time took the whole possession of her mind. David Rizzio, the son of an Italian musician, had accompanied the Piedmontese ambassador to Scotland, and gained admission into the queen's family by his musical talents. He soon shared much of her favour, and was raised to the office of her French secretary. This good fortune rendered him so arrogant and insolent, that he was regarded by the nobles with all the ill-will usually attending a worthless favourite. Rizzio assisted Darnley in engaging the affections of the queen; and very soon after the marriage he became his rival, and took such liberties with the queen, as passed all bounds of prudence and decorum, and Darnley resolved to get rid of him. At the same moment, some men of rank, who imputed to Rizzio the queen's enmity to the exiled nobles, concurred in the project for his destruction. A conspiracy was formed for effecting the purpose, and a band of armed ruffians took possession of the gates of the palace of Holyrood house, while the king, with some other persons, and lord Ruthven in complete armour, entered the chamber where Mary was at supper with the countess of Argyle and Rizzio. The unhappy victim clung to the queen for protection; but her entreaties and supplications were of no avail; he was dragged from her presence, and murdered in the next apartment. This savage deed, aggravated by the queen's situation, who was far advanced in pregnancy, could not be forgiven. From this hour, Mary took no pains to conceal her hatred of her husband, whom she treated with every mark of aversion and contempt,

nor did the birth of a son, afterwards James VI. of Scotland, and the first of that name in England, produce a reconciliation. She, however, soon transferred her affection from Rizzio to Hepburn, earl of Bothwell, a potent nobleman, who had ever evinced an attachment to her cause, and had been a principal instrument of rescuing her from the power of the conspirators, who would willingly have sacrificed her as well as her paramour. He, neglected and despised by every one, was glad to live in solitude; and in the beginning of 1567, he was seized with a disorder, which brought his life into danger, and which was attributed by some persons to poison. When he was getting better, Mary paid him a visit at Glasgow, in which she put on an appearance of the greatest kindness and affection, and he consented to accompany her to Edinburgh. Here she attended him with the assiduity of a tender wife, and slept two nights in the chamber under his apartment. But on the next day she left him to be present at a masque in her palace, and at two o'clock the following morning the house was blown up with gunpowder, and the king's dead body was found in an adjacent field. To Bothwell and the queen this foul deed was imputed, and the late king's father insisted that the former should be brought to trial, but no person appearing as his accuser on the day appointed, he was acquitted. Within a week from this acquittal, Bothwell, at a public entertainment, openly avowed his intention of marrying the queen; the persons present, people of the highest rank in the country, applauded his determination, and subscribed a paper expressing their conviction of his innocence with respect to the murder, and recommending him as husband to the queen. The sentiments of the nation by no means corresponded with the declaration of these mean spirited nobles, and the projected union was generally looked upon with detestation. Bothwell resolved to bring it to effect with violence. As the queen was proceeding from Edinburgh to Stirling, to visit her infant son, he suddenly appeared on the road with a large body of horse, dispersed her slender train, and seizing her person with a few courtiers, conveyed them to his castle at Dunbar. That this was a preconcerted plan, done with the consent of the queen, there never was a doubt in any one's mind. On the 15th of May, and within a few weeks of her husband's murder, the marriage was consummated; and from this period, Bothwell, without the title of king, possessed the whole power of the crown; no access was permitted to the queen except through his creatures, and he made a desperate attempt to get the person of the young prince into his hands, but without success. These transactions excited a general indignation in foreign countries, and rendered the Scottish name odious, till at length the nobles of the land redeemed their credit by a determined and practical patriotism in defending the prince. They collected an army, and declared against Bothwell, who, with the queen, retired to Dunbar, and also raised troops. To avoid the consequences of a battle, Mary was obliged to accept the condition of dismissing Bothwell from her presence, and surrendering herself to the confederates. Bothwell took his leave, and rode from the field, just one month after his marriage, and she never saw him afterwards. She was, after this, received with respect by the nobles; but the soldiers and common people could not be prevented from expressing their feelings in the most opprobrious terms. A standard was held before her, on which was painted the corpse of the late king, with the infant prince kneeling, and uttering the words "Judge and revenge my cause, O Lord." She was conducted to Edinburgh, as a spectacle of shame through the streets, and sympathy for her condition was lost, in horror of her real or imputed crimes. She was soon

after obliged to resign the crown, which was placed on the head of the prince, Murray being appointed regent during the minority. Mary was now thrown into prison, from which she contrived to make her escape, and after an unsuccessful attempt to regain her power, she resolved to throw herself upon the generosity of her rival, Elizabeth, and hastily embarking in a fishing-boat, she landed at Workington in Cumberland, whence she was respectfully conducted to Carlisle. The queen of England was at a loss to know how to treat a foreign princess expelled from her country, and accused by her own subjects, who was likewise regarded by the Catholic party as the rightful claimant of the English crown. She determined, however, to take advantage of the incident, and at least to detain her as a sort of state prisoner. Mary proposed to submit her cause to the cognizance of her sister-queen; the offer was accepted, as implying a kind of judicial superiority in the latter, and affording the occasion of keeping Mary in a distant confinement for an indefinite period. By the requisition of Elizabeth, the regent Murray was induced to appoint commissioners to support his cause, Mary did the same on her part; and Elizabeth nominated three persons of distinction to hear both parties. The conferences were opened at York, whence, after a time, they were removed to Westminster. The regent directly accused Mary of being accessory to the murder of her husband, of which, it was said, proofs were adduced in her own hand-writing; but after a variety of delays and subtleties, by which both queens seemed inclined to stifle inquiry, the regent, who had come in person to England, was dismissed without either approbation or censure, while Elizabeth determined to support his party in Scotland, and Mary remained in custody. She hoped to regain her liberty by means of a marriage with the duke of Norfolk. Elizabeth was kept in ignorance of the design, while it was communicated to the courts of France and Spain, who highly approved it. When the fact was discovered by the vigilance of her ministers, she, without hesitation, committed the duke to the Tower. A rebellion in behalf of Mary's cause broke out in the north of England, which, though speedily suppressed, excited in the mind of Elizabeth such apprehensions, that in 1570 she had come to the determination of sending back the captive to her own country, under the custody of the regent. This plan was defeated by the murder of that nobleman, an event that revived the hopes of Mary's friends and adherents in Scotland, and caused great confusion in that country. The duke of Norfolk was liberated from confinement, and, carrying on a correspondence with Mary, was seduced, in 1571, into a conspiracy, which cost him his life. Mary, whose place of confinement had been the castle of Tutbury, was, on account of ill health, suffered to go to Buxton. About this period the earl of Morton fell into the power of his enemies in Scotland, and was tried and convicted of having a share in the late king's death. By his dying confession, he admitted that he had been informed by Bothwell of the conspiracy, but that finding the queen was the author of it, he forebore to take any steps to reveal it. In 1584, there were other plots contrived to effect Mary's escape, by one of which the English nation was thrown into such alarms for the safety of the queen and the Protestant religion, that a measure was adopted which may be considered as the fore-runner of Mary's fate. This was an association, by which the subscribers bound themselves, by the most solemn oaths, to defend queen Elizabeth from all enemies, foreign and domestic. The unanimity with which this association was entered into by all ranks of people alarmed Mary, who submitted herself, with great apparent humility, to the queen's disposal, though she was almost

at the same instant detected in secret correspondence with the English Catholics. She had hitherto been under the care of the earl of Shrewsbury, who had discharged the trust reposed in him during fifteen years with respect and lenity towards the unfortunate captive, and with great integrity towards his employers. She was now committed to the custody of two keepers of inferior rank and harsh dispositions, viz. sir Drue Drury, and sir Amias Paulet. Elizabeth, in the mean time, obtained an ascendancy over the councils of the young king of Scotland, and engaged him in a league for the protection of the Protestant religion, now endangered by the power and bigotry of Philip II. of Spain.

A new conspiracy against the life of the queen of England afforded her ministers an opportunity of involving Mary as an accomplice in it, and letters asserted to be her's were produced, which proved, or which were thought to prove, her participation in the design of assassinating Elizabeth. The circumstances, if founded in fact, were no doubt greatly exaggerated, the zeal of the nation was inflamed to the highest degree, and the punishment of the great culprit was loudly called for. The court, being backed by the people at large, resolved to proceed to the extremity it had long meditated. The papers of the Scottish queen and her domestics were seized, and she herself was conveyed a *close* prisoner to Fotheringay-castle. Under the cover of that phrase, "close imprisonment," there is no treatment, however severe, that has not been practised by gaolers, and sanctioned by their employers. Preparations were made for trying her publicly, and in October, 1586, a commission was opened for the purpose. At first she refused to plead, using the obvious and valid arguments, that she was a foreigner, and a sovereign in her own right: that she owed no allegiance to the laws of a kingdom in which she had been treated only as a captive, and from which she had received no protection. Her objections being over-ruled, she was persuaded or threatened into a consent to plead. She made her defence with great dignity of mind, and solemnly disclaimed the least concurrence in any design to take away the queen's life; she was, however, declared guilty of being an accessory to Babington's conspiracy. Though the trial was conducted in a manner which would have been illegal, even if she had been a subject of England, and though no certain proof could be made out against her, she was, to the astonishment of Europe, condemned to suffer death. The fair heroine received her sentence with fortitude and composure, and when the earls of Shrewsbury and Kent were introduced to inform her that she must prepare for death next morning at eight o'clock, she seemed in nowise terrified, though somewhat surprised with the intelligence. She said with a cheerful and smiling countenance, that she did not think the queen would have consented to her death, or have executed the sentence against a person not subject to the laws and jurisdiction of England: "But as such is her will," said she, "death, which puts an end to all my miseries, shall be to me most welcome; nor can I esteem that foul worthy the felicities of heaven, which cannot support the body under the horrors of the last passage to these blissful mansions." On the evening before her execution on the succeeding morning, she prepared herself with religious solemnity and perfect resignation. She called in all her servants and drank to them: they pledged her, in order, on their knees; and craved her pardon for any past neglect of their duty: she even deigned, in return, to ask pardon for her offences towards them, and a plentiful effusion of tears attended this last solemn farewell and exchange of mutual forgiveness. She then distributed among them her money, her jewels, and her clothes, according to their rank and

merit. She wrote her will with her own hand, constituting the duke of Guise her principal executor, and to the king and queen of France she recommended her son, provided he should prove worthy of their esteem. At her usual time she went to bed, slept some hours, and then rising, spent the rest of the night in prayer. Having foreseen the difficulty of exercising the rites of her religion, she had taken the precaution to obtain a consecrated host from the hands of pope Pius, and she had reserved the use of it for this last period of her life. By this expedient, she supplied, as much as she could, the want of a priest and confessor, which was refused her by the bigotry of the earls of Shrewsbury and Kent, who would have forced upon her the dean of Peterborough, rather to enter upon controversial topics, than to afford her the consolation that her situation required. Towards the morning she dressed herself in very elegant attire, and met the awful ceremony with a dignity and mildness of disposition that affected every beholder, except, perhaps, the dean of Peterborough, who insulted her with his exhortations, and the two noble earls, who seemed desirous of refusing every request, however reasonable for her to ask, and for them to grant. Her behaviour at this awful crisis has furnished matter for all the descriptive eloquence of history: it was indeed calm, magnanimous, and pathetic, in a supreme degree. After due preparations, she laid her head on the block, and firmly received the fatal stroke. She died in her forty-fifth year, after a captivity of almost nineteen years. She was a woman of great accomplishments both of body and mind, natural as well as acquired, but unfortunate in her life, and, during one period, very unhappy in her conduct. An enumeration of her qualities might carry the appearance of panegyric; an account of her conduct must, in some parts, wear the aspect of severe satire and invective. Her misfortunes, the solitude of her long and tedious captivity, and the persecutions to which she had been exposed on account of her religion, had wrought her up to a degree of bigotry during her later years, and such were the prevalent spirit and principles of the age, that it is the less wonder if her zeal, her resentment, and her interest uniting, induced her to give consent to a design which conspirators, actuated only by the first of these motives, had formed against the life of Elizabeth. Mary wrote "Poems on various occasions, in the Latin, French, and Scotch languages:" "Consolations of her long imprisonment, and royal advice to her son:" "A Copy of Verses, in French, sent with a diamond ring to queen Elizabeth:" "Genuine Letters of Mary, queen of Scots, to James, earl of Bothwell." Besides these, there are many other of her epistles to queen Elizabeth, Cecil, and other distinguished characters preserved in the Cottonian and Ashmolean libraries. Robertson's Hist. of Scotland. Hume's Hist. of England.

MARY, *St.*, in *Geography*, an island in the East Indian sea, near the N.W. coast of the island of Borneo. N. lat. 6° 30'. E. long. 114° 30'.—Also, one of the Scilly islands. N. lat. 49° 57'. W. long. 6° 17'. See *SCILLY ISLANDS*.—Also, an island in the Indian sea, separated from the E. coast of Madagascar, by a strait about three leagues wide; the island is about 15 leagues long, and from two to three wide, amidst rocks, on which is found some beautiful white coral; on the E. coast is found ambergris, used by the inhabitants in their sacrifices to the memory of their ancestors. The interior abounds with gentle hills, innumerable brooks, and springs of fresh water. The inhabitants, who pretend to be the descendants of Abraham, call the island "Noffi Ibrahim." The soil is fertile, and produces rice, sugar-canes, legumes of different kinds, pine-apples, tobacco, &c. The air is insalubrious, and rain frequently occurs and sometimes

times continues, without intermission, for a fortnight. S. lat. $16^{\circ} 40'$. E. long. $50^{\circ} 30'$.—Also, one of the Shiant islands, among the Western islands, near the S.E. coast of Lewis, in Scotland, about seven miles in circumference; 22 miles S. of Stornaway.—Also, one of the Azores islands. N. lat. 37° . W. long. $25^{\circ} 6'$.—Also, a county of Maryland, on the peninsula between Patowmac and Patuxent rivers, 39 miles long, and 15 broad, containing 13,699 inhabitants, of whom 6399 are slaves.—Also, a post-town and port of entry of Georgia, situated on St. Mary river, a few miles from its mouth. The town is small, and its trade is inconsiderable; 129 miles S. of Savannah. N. lat. $30^{\circ} 45'$. W. long. $79^{\circ} 12'$.—Also, a river which forms part of the southern boundary line of the Upper States; and in part divides Georgia from East Florida. It rises in the great Okafonoka or Ekanlanoga swamp, which extends S. into E. Florida. It is thought to be that which is called May river, discovered by John Ribalt in 1562. Between this and Nassau river lies the low even coast of Amelia island. The harbours of both rivers are spacious, but St. Mary's is the safest; it has nine feet of water at low spring tides, runs a course of 150 miles, enters the ocean between the points of Amelia and Talbert's islands, in N. lat. $30^{\circ} 44'$, and is navigable for vessels of considerable burden for 90 miles. Its banks afford immense quantities of fine timber, suited to the West India market.—Also, a branch of the Miami, which runs into lake Erie.—Also, a river of Nova Scotia, which runs into the sea, N. lat. $45^{\circ} 5'$. W. long. 61° .—Also, a river of America, which runs from lake Superior to lake Huron; on which are two forts. N. lat. $46^{\circ} 22'$. W. long. $84^{\circ} 24'$.—Also, a port on the S. side of the bay of Fundy.—Also, a small island, called "Bates Island," in the German sea, near the E. coast of England, and county of Northumberland; six miles N.N.W. of Tynemouth. N. lat. $55^{\circ} 6'$. W. long. $1^{\circ} 11'$.

MARY'S, *St.*, Bay, a bay on the S. coast of Newfoundland. N. lat. 57° . W. long. $54^{\circ} 20'$.—Also, a bay of the Atlantic, on the coast of Africa. S. lat. $13^{\circ} 12'$.—Also, a bay on the W. coast of Nova Scotia, E. of the bay of Fundy.

MARY, *St.*, Cape, the most southern promontory of Brazil.—Also, the point of land which forms the N. side of the mouth of La Plata river, in Paraguay, or La Plata, in South America. S. lat. $35^{\circ} 14'$. W. long. $55^{\circ} 32'$.—Also, the S.E. headland at the mouth of Placentia bay, Newfoundland.

MARY, *St.*, Falls of, a cataract in St. Mary's river, between lake Superior and lake Huron, consisting not of a perpendicular descent of water, but of a rapid, which continues near three quarters of a mile, over which canoes, well-piloted, might pass. These falls supply immense quantities of fish, which are commodiously caught by dipping nets at the bottom of the falls.

MARY'S, *St.*, Inlet, a bay on the coast of Georgia, at the mouth of the river St. Mary. N. lat. $30^{\circ} 56'$. W. long. $81^{\circ} 40'$.

MARY'S, *St.*, Islands, a cluster of small islands in the gulf of St. Lawrence, near the S. coast of Labrador. N. lat. $50^{\circ} 20'$. W. long. 60° .

MARY'S, *St.*, Keys, rocks on the S. coast of Newfoundland. N. lat. $46^{\circ} 47'$. W. long. $53^{\circ} 55'$.

MARY'S, *St.*, Key, a small island in the gulf of Mexico, near the coast of Florida. N. lat. $30^{\circ} 11'$. W. long. $89^{\circ} 12'$.

MARY, in Heraldry, *Knights of St. Mary*, is a name by which several orders of knighthood are distinguished. As, the *Virgin Mary* and *St. Blaize*. See ST. BLAISE. *St.*

Mary of the Thistle. See THISTLE. *St. Mary of the Conception*. See CONCEPTION. *St. Mary of the Elephant*. See ELEPHANT. *St. Mary and Jesus*. See JESUS. *St. Mary of Loretto*. See LORETTO. *St. Mary of Mount Carmel*. See CARMEL. *St. Mary of the Teutonic*. See TEUTONIC, &c.

MARYBONE, or ST. MARY LE BONE, a large parish at the north-western extremity of London, and now constituting a populous portion of this capital. It was anciently called Tiburn, from its situation near a small bourn or rivulet, which was formerly named Aye-brook or Eye-brook. When the site of the church was changed to a place near the brook, it appears to have gained the appellation of St. Mary-at-the-Bourn, of which its present name is a corruption. The parish is situated in the hundred of Ossulston, and county of Middlesex; is eight miles and a quarter in circumference; and contains about 2500 acres, whereof nearly half is occupied by buildings, and the remainder, extending westward to Kilbourn turnpike, and northward to Primrose-hill, is grass-land, except a few acres appropriated to market gardeners. The soil on the north side of the parish is clay, and on the south a fine gravel. The manor of Tybourn was an ancient demesne of the crown; and the manor-house was used as a palace: this mansion was pulled down in the year 1791, and Devonshire Mews built on the site. In the vicinity was a well known place of entertainment called Marybone-gardens, which were opened before the year 1737, for public breakfasts, and evening concerts with exhibitions of fire-works, &c. The gardens were shut up in 1778; and the site is now occupied by Beaumont-street, and part of Devonshire-street and Devonshire-place. Marybone-park, a part of the ancient royal demesne, and since called Marybone-park farm, contains 543 acres, according to an actual survey made in the year 1794, under the direction of John Fordyce, esq. surveyor-general of the crown lands. About two-thirds of this district are in the parish of Marybone, and the remainder in that of Pancras. A new scheme has been recently proposed to lay it out for villas, rides, streets, &c. A canal, (called the Regent's) from Paddington to the Thames, is to pass through it. An act of parliament for this purpose was obtained in the year 1812. It was also designed to build extensive barracks here; but this scheme having been severely and justly reprobated in some of the public journals, it is relinquished. Since Marybone has been in some degree incorporated with London, several splendid mansions have been erected by the nobility, and other persons of opulence within this parish. The most remarkable are, the earl of Aldborough's in Stratford place; Montague house, in Portman square; Manchester-house; Harcourt-house; Chandos-house; Foley-house, which might have been added to the list, is now taken down, and the ground let to build a wide street from Portland-place southward. In Duchefs-street, Thomas Hope, esq. has a splendid mansion, containing a large and valuable collection of ancient vases, sculpture, paintings, &c. The late sir Francis Bourgeois had a handsome house in Charlotte-street, which was filled with a large and choice collection of pictures by the most eminent masters. The whole of these are bequeathed to Dulwich college, in Kent, where a large and appropriate gallery is now building for their reception, from the classical designs of John Soane, esq. professor of architecture to the Royal Academy. Attached to which is a mausoleum, to contain the remains of the late sir Francis, and also those of his friend Noel Desenfans, esq. In the year 1400, bishop Braybrooke granted a licence to take down the old church of Tybourn, and to build a new church of stones or flints in a more eligible situation. This edifice, called Marybone church, being, through length of

of time, in a ruinous condition, was taken down in the year 1741, when the present structure was erected on the site; but it is very small and ill suited to the present population. There are, however, eight private chapels in the parish, belonging to the establishment of the church of England; *viz.* Oxford chapel, built before 1739; Portland chapel, 1766; Bentinck chapel, 1772; Welbeck chapel, 1774; Portman chapel, 1779; Quebec chapel, 1788; Margaret-street chapel, first used as a place of worship of the established church in 1789; Brunswick chapel was built about the year 1795. The parish also contains several chapels appropriated to persons of different religious profession; among which are two for Roman Catholics; one belonging to the Greek church; and one for the Wesleyan Methodists.

At the beginning of the last century, Marybone was a small village, nearly a mile distant from any part of the metropolis. In the year 1715, a plan was formed for building Cavendish-square, and several streets on the north side of Tybourn road. In 1718, the ground was laid out, the circle for the centre inclosed, and surrounded with a parapet-wall and palisades. The duke of Chandos took the whole north side, intending to build a magnificent mansion, of which the houses belonging to the earls of Hopetown and Gainsborough were to have been the wings. Lord Harcourt and lord Bingley took some ground on the east and west sides, and the rest was let to builders; but the failures of the South-sea year put a stop to the improvements, and the square was not completed for several years. As an inducement to the builders to persevere, a chapel and market were projected; and they were both finished in 1724, though the market was not opened till 1732. The houses on the north side of Tybourn road were completed in 1729, and it was then called Oxford-street. Maitland, whose work was published in 1739, says, there were in his time 577 houses in Marybone parish. Portman-square was begun about 1764, and Portland-place about 1770. Manchester-square, which had been begun in 1776, by the building of Manchester-house, was finished in 1788. From that time to the commencement of the present war, the buildings rapidly increased. In the return under the population act of 1800, this parish is stated to contain 7764 houses, occupied by 63,982 persons. The present number of houses must exceed 8330. The progressive increase in the population appears in the registers of baptisms and burials, which were, on an average,

Years.	Average of Baptisms.	Average of Burials.

Among the many eminent persons buried in this parish, we specify the following names: Humphrey Wanley, antiquary; James Figg, the celebrated prize-fighter, rendered famous by being a subject for Hogarth's pencil; James Gibbs, architect; Archibald Bower, historian, &c.; Edmund Hoyle, author of the treatise on Whist; John Michael Rybrack, statuary; William Guthrie, historian and geographer; James Ferguson, astronomer; Allan Ramsay, portrait-painter; Mark Anthony Joseph Baretti, linguist; John Dominick Serres, marine-painter; Stephen

Storage, an eminent musical composer; William Cramer, musician; Francis Wheatley, artist; George Stubbs, artist; admiral sir Richard King, baronet; Alexander Dalrymple, geographer, &c.; Thomas Holcroft, author of various works; William Henry Cavendish, duke of Portland. Very numerous entries occur in the registers of marriages, baptisms, and burials, relating to families of the first rank. A charity-school was instituted in this parish in 1750, for clothing, instructing, and apprenticing the children of the industrious poor. On the north side of Oxford-road, near Stratford-place, were some ancient conduits belonging to the city of London: near them stood the lord mayor's banqueting-house, where the city officers were accommodated when they went to view the conduits; it was pulled down in 1737, and the springs were arched over.

This parish is governed by a select vestry, and is extremely well regulated, for which it is much indebted to the late bishop Harley, who was many years curate here, and exerted his interest in procuring the acts of parliament by which the regulations are confirmed.

The public place of execution for criminals convicted in the city of London and county of Middlesex, was formerly in this parish, at the end of Park-lane, near Tybourn-turnpike. For further particulars respecting this part of London, see PADDINGTON and PANCRAS. Lysons's *Environs of London*, vol. iii. and Supplement to ditto, 1812, 4to. Malcolms "Londinium Redivivum," vol. iv. 4to.

MARYBOROUGH, a post-town of Ireland, in the Queen's county and province of Leinster. It is situated on the river Barrow, and is the assizes town of the county. It is not large; but in its neighbourhood is manufactured a great quantity of stuffs, serges, druggets, and other woollen goods. Maryborough received its name from queen Mary I. in whose reign the county was made shire ground: it had, before the Union, the privilege of being represented in parliament; and it still retains its peculiar magistrates. It is 40 miles S.W. from Dublin. Carlisle. Beaufort.

MARYGOLD, in *Botany*. See CALENDULA.

The leaves of this plant appear to be of greater virtue than the flowers, to which many exploded virtues have been ascribed: their expressed juice has been given in doses of two or three ounces, or more, as an aperient; and is said to loosen the belly, and promote the natural secretions in general. Lewis.

MARYGOLD, *African*. See TAGETES.

MARYGOLD, *Corn*. See CHRYSANTHEMUM.

MARYGOLD, *Fig*. See MESEMBRYANTHEMUM.

MARYGOLD, *French*. See TAGETES.

MARYGOLD, *Marsh*. See CALTHA.

MARYGOLD, *Zoophyte*, in *Natural History*, the name of a species of sea-animal, of a very beautiful kind, and of the nature of those commonly called *zoophytes*, or plant-animals, by the old naturalists. In St. Lucy's parish, in Barbadoes, there is a cave, in which is a basin of very clear salt water: and in the midst of this basin lies a stone, which has been for many years found to be the habitation of a great number of animals of this species.

The stone is always covered with water; and from small holes in its sides, in several parts, there appears at all times of the year a number of creatures representing the flowers of some of the radiated plants, and particularly of the common marygold: they are yellow, and seem composed of a very great number of petals. These, in their natural state, are all regularly and beautifully expanded; but as soon as any thing disturbs them, if it be only the motion

of a stick, that comes within three or four inches of them, they in an instant close all the leaves up together, and the whole body, flower, stalk and all, is retracted back into the hole of the stone; but if the water be left a few minutes undisturbed again, they will appear, and expand themselves in the former manner.

When they are nicely observed, there is a yet farther resemblance of a flower in their structure; for there arise from the centre of the body certain oblong bodies, which very naturally resemble the stamina arising from the centre of a flower; but these have evidently the powers of animal limbs; for they no sooner appear, but they dart themselves about to the verge of the flower in several directions, and are plainly busied in search of prey.—They are composed of several joints, and the creature often makes them meet in the manner of a forceps, to lay hold of any thing it pleases. These parts, however, seldom appear thus exerted any long time together, but are, after a time, received back into the body.

These arms may easily be conceived to be of use to draw in the prey within the compass of the body of the animal; and as soon as it is there, the same contraction of the several rays which serves them to escape danger, and bury

themselves in the cavity of the stone, will also serve to hold fast the prey till the creature has fed on it.

Beside these large yellow radiated zoophytes, the top of the stone usually affords a number of others of a blue colour, which stand among a sort of vesicles of water-badders, disposed like clusters of grapes. Philof. Transf. N^o 470. p. 591.

MARY-GREY, in *Geography*, the name of a tolerably high mountain in the county of Tyrone, Ireland, between Omagh and Strabane. The road passes between this mountain and Bally Bell, another insulated mountain of considerable height. Beaufort.

MARYKIRK, a town on the S. coast of the island of Sanday. N. lat. 59° 6'. W. long. 2° 27'.

MARYLAND, one of the United States of America, lying between 37° 56' and 39° 44' N. lat. and 0° and 4° 30' W. long. 134 miles in length and 110 in breadth, or 14,000 square miles in superficial measure, one-fourth of which is water. This state is bounded N. by Pennsylvania, E. by Delaware state and the Atlantic ocean, and S. and W. by Virginia. It is divided into 19 counties, 11 on the western, and eight on the eastern shore of Chesapeake bay, as in the following table.

Counties.		No. Inhab. in 1790.	No. Inhab. in 1800.	No. Slaves in 1790.	No. Slaves in 1800.	Chief Towns.

Each of the counties sends four representatives to the house of delegates, besides which the city of Annapolis and town of Baltimore send each two. Annapolis is the capital of the state: but Baltimore is more populous and of greater commercial importance. The number of inhabitants in this latter town, according to the census of 1800, was 26,514, of whom 2843 were slaves. The bank established in Baltimore, with a capital of 300,000 dollars, is called "The Maryland Bank." There is, besides, a branch of the bank of the United States. In 1796 a new bank was established by law, with a capital of 2,000,000 dollars, called "The Bank of Baltimore." The other principal towns of this state are Georgetown, in which a bank has been lately established, called "The Bank of Columbia," and also a college for the

accommodation of about 200 students, endowed chiefly by Roman Catholics of the several states, but as to education unlimited by any particular sect;—Fredericktown;—Elizabethtown;—and Elkton. See each place respectively. Chesapeake bay, which separates this state into the eastern and western divisions, receives a number of large rivers; from the eastern shore in Maryland, among other smaller ones, it receives Pokomoke, Nanticoke, Choptank, Chester, and Elk rivers; from the north, the rapid Susquehanna; and from the west Patapsco, Severn, Patuxent, and Patowmac, half of which is in Maryland, and half in Virginia. The Susquehanna and Patowmac excepted, these are small rivers. As to the face of the country, eastern of the blue ridge of mountains, which stretches across the western part

MARYLAND.

of this state, the land is generally level and free from stones. The ground is uniformly level and low in most of the counties on the eastern shore, and consequently much covered with water, except where it is intercepted by numerous creeks. The large tracts of marsh render the close of the summer and fall seasons in this part of the state sickly; spring and summer are most healthy. The soil of the good land in Maryland produces from 12 to 16 bushels of wheat, or from 20 to 30 bushels of Indian corn, *per* acre. Ten bushels of wheat, and 15 bushels of corn *per* acre, are the annual average crops in the state at large. The staple commodities are wheat and tobacco. Some cotton of inferior quality is also raised in this state, and in the interior counties, as the Uplands, considerable quantities of hemp and flax are cultivated. Two articles are said to be peculiar to Maryland, *viz.* the genuine white wheat, which grows in Kent, Queen Ann's, and Talbot counties, on the eastern shore, and which degenerates in other places; and the bright *kite's foot* tobacco, which is produced at Elkridge, on the Patuxent, on the western shore. Among other kinds of timber are the oak, of several kinds, made into staves for exportation, and the black walnut employed for furniture. The apples are large but mealy; the peaches plentiful and good. From these the inhabitants distil cyder, brandy, and peach-brandy. The forests abound with various kinds of nuts, collectively called "Maft," and used for fattening hogs, which run wild in the woods. As to the manners of the inhabitants, Mr. Morfe says that the farmers of Maryland associate very much with each other; that their manners are as polished as those of the country gentlemen in England, their minds well informed, and their intercourse free and social; their sons generally receive a liberal education, and many of them engage in the study of the law, without pursuing it as a profession. The inhabitants of Maryland, however, are not exempt from that pride, which is too general among those who are connected with and accustomed to slaves; but with their pride they blend a great degree of hospitality. Many of their women possess all the amiable, and many of the elegant accomplishments of their sex. The mines of iron ore in this state abound, and it is of superior quality; furnaces and forges are also numerous. Coal has been lately found near Baltimore, and great quantities of rye-whiskey are manufactured in this state; grist-mills are common. The trade of Maryland is principally carried on from Baltimore, with the other states, with the West Indies, and with some parts of Europe. To these places the inhabitants send annually about 30,000 hogheads of tobacco, besides large quantities of wheat flour, pig-iron, lumber, and corn; beans, pork, and flax-seed in smaller quantities; and receive, in return, clothing for themselves and negroes, and other dry goods, wines, spirits, sugar, and other West Indian commodities. The balance is generally in their favour. The value of exports from this state in 1801 was 9,151,939 dollars. The first settlers in Maryland were Roman Catholics; besides these, there are many Protestant Episcopalians, English, Scotch, and Irish Presbyterians, German Calvinists, German Lutherans, Friends, Baptists, Methodists, Mennonists, and Nicolites or New Quakers; all of whom enjoy liberty of conscience. For the seminaries of learning in Maryland; see COLLEGE.

The revenue of Maryland arises chiefly from taxes on real and personal property; and the annual expences of government are estimated at about 20,000*l.* currency. The legislature is composed of a senate and house of delegates, which are styled "The General Assembly of Maryland." The senators are elected in the following manner. On the

1st of September, every fifth year, the freemen choose two men in each county, to be electors of the senate, and one elector for the city of Annapolis, and one for the town of Baltimore. These electors, possessing the qualifications necessary for county delegates, meet at Annapolis, or any other appointed place, on the third Monday in September, every fifth year, and elect by ballot fifteen senators out of their own body, or from the people at large: nine of them residents on the western, and six on the eastern shore; all more than twenty-five years of age; residents in the state more than three years before the election; and possessing a real and personal property above the value of 1000*l.* The senate may originate any bills, except money bills, to which they can only give their assent or dissent. The president of the senate is chosen by ballot. The house of delegates is composed of four members for each county, chosen annually the first Monday in October: the city of Annapolis and town of Baltimore, as we have already observed, send each of them two delegates. The qualifications of a delegate are, full age, one year's residence in the county where he is chosen, and real and personal property above the value of 500*l.* Both houses choose their own officers, and judge of the election of their members; a majority of each is a quorum. The election of senators and delegates is *viva voce*, and sheriffs the returning officers, except in Baltimore town, where the commissioners superintend the elections, and make returns. The stated session of the legislature is on the first Monday in November. The qualifications of a freeman are, full age, a freehold estate of fifty acres of land, and actual residence for a year in the county where he votes, and property in any part of the state to the value of 30*l.* The governor is appointed on the second Monday in November, annually, by the joint ballot of both houses; but cannot continue in office longer than three years successively, nor be re-elected until the expiration of four years after he has been out of office. The qualifications for the chief magistracy are twenty-five years of age, five years' residence in the state, next preceding the election, and real and personal estate above the value of 5000*l.*, 1000*l.* of which must be freehold estate. A council for assisting the governor in his office, consisting of five persons above twenty-five years of age, residents in the state three years next preceding the election, and possessing a freehold of lands and tenements above the value of 1000*l.* is chosen, annually, on the second Tuesday of November by joint ballot of senators and delegates. The governor, with the advice of his council, appoints the chancellor, all judges and justices, the attorney-general, naval and militia officers, and all others, except constables, assessors, and overseers of the roads. A court of appeals is established for the final determination of all causes, which may be brought from the general court of admiralty, or of chancery. This constitution was established by a convention of delegates at Annapolis, Aug. 14, 1776.

Maryland was granted by king Charles I. to George Calvert, baron of Baltimore, in Ireland, June 20, 1632. It was called Maryland in honour of the queen, Henrietta Maria, and was the first colony which was erected into a province of the English empire, and governed by laws enacted in a provincial legislature. The first emigration, consisting of about 200 gentlemen of considerable fortune and rank, with their adherents, chiefly Roman Catholics, sailed from England in November 1632, and landed near the mouth of Patowmac river in the beginning of the following year. Calvert purchased the rights of the aborigines for a satisfactory consideration; and, with their free consent, took possession in March, 1633, of the town, which he

he called St. Mary's. The foundation of this province was laid by lord Baltimore, on the broad basis of security to property and liberty in religion; Christianity being established without allowing pre-eminence to any particular sect. This wise measure soon converted a dreary wilderness into a prosperous colony. The transportation of people and of stores, during the first two years, cost lord Baltimore upwards of 40,000*l.* The freemen of the province, as an expression of gratitude, granted him, at an early period, a subsidy of fifteen pounds of tobacco on every poll. The first assembly was convened in February, 1634-5. Successive assemblies were convened in January, 1637-8, and in February, 1638-9: at which latter meeting an act passed "for establishing the house of assembly." An attempt was made by the British parliament, in 1640, to annul the charter of Maryland; but the effort failed, and Maryland remained prosperous and happy, till the intrigues of one William Cleyborne disturbed its tranquillity. In 1645, a rebellion was raised in the province; nor were peace and order restored till August, 1646. The assembly at that time, though composed chiefly of Roman Catholics, passed an act, which indicates a spirit of liberality very uncommon at that period. It recited, that the enforcement of conscience had ever been of dangerous consequence in those countries in which it had been practised. And it was enacted, "that no persons professing to believe in Jesus Christ should be molested in respect of their religion, or in the free exercise thereof, or be compelled to the exercise of any other religion, against their consent; so that they be not unfaithful to the proprietary, or conspire against the civil government. That any person molesting another in respect of his religious tenets, should pay treble damages to the party aggrieved, and twenty shillings to the proprietary; that those reproaching any with opprobrious names of religious distinction, should forfeit ten shillings to the persons injured; that any one speaking reproachfully against the blessed virgin, or the apostles, should forfeit five pounds. But blasphemy against God should be punished with death." This act passed 1649, and was confirmed in 1676, among the perpetual laws of the province. The year 1650 is remarkable in the history of Maryland for the final establishment of that constitution, which continued, with some short interruption, till the present one was adopted in 1776. In 1692, the Protestant religion was established by law in this province. In 1716, the government was restored to Charles, lord Baltimore, the then proprietary, and continued in his hands, and those of his successors, till the late revolution; when, though a minor, the proprietary's property in the lands were confiscated, and the government assumed by the freemen of the province, who framed the present constitution. Maryland was the last to sign the articles of confederation, published by congress after the declaration of independence. On the 1st of March, 1781, they signed these articles, and they were thus finally ratified. Morfe's Geog. vol. i.

MARYLAND Point, a point in the state of Maryland, formed by a bend in the Patowmac river, W. of Fort Tobacco.

MARY-POR'T, a market town in the parish of Cross-Canonby, Allerdale Ward, Cumberland, England, is situated six miles distant from Workington, and 309 from London, on the banks of the river Ellen, which divides it into two parts. It was first called Mary-port, in honour of the lady of the late Humphrey Senhouse, esq. whose family have long been proprietors of the manor: the small hamlet from which the town arose, was named Ellen or Elene-foot, from its situation. This town, like many on the western coast of Cumberland, derives its origin and consequence from the

VOL. XXII.

coal trade: about the middle of the last century, the beach was occupied by only one house, called Valencia, and about half a score miserable huts, that served to shelter a few fishermen; but so great has been the increase of population and building, that in the year 1801 the houses amounted to 520, and the number of inhabitants was 2932. The streets are wide, and the houses neatly built. Wooden piers, with quays, have been erected on each side of the river, for the convenience of shipping. There are now belonging to the port between seventy and eighty vessels, from 30 to 250 tons burthen. They are chiefly employed in the exportation of coal to Ireland; and in the importing of timber, flax, and iron from the Baltic. An extensive cotton manufactory has been established here, which furnishes employment for nearly 500 people. A weekly market is held on Fridays. A chapel was erected in the year 1760, and consecrated in 1763, by bishop Lyttelton. On an eminence, called the Mote-hill, at the south end of the town, is an artificial mount, the base of which is one hundred yards in circumference. It is protected by a deep ditch, which almost surrounds it.

On the north side of the Ellen, near Maryport, are the remains of a considerable Roman station, generally called Ellenborough; though the village of that name stands on the opposite side of the river at some distance. This station, in the opinion of Horsley and Warburton, was the Virofidum of the Notitia. Camden supposed it to be the Volantium; and other writers have styled it Olenacum. The fort is on a high bank, overhanging the sea, and commanding an extensive prospect of the Scottish coast. The area is a square, with four entrances, and defended by a double ditch and rampart. The numerous vestiges of antiquity and variety of inscriptions found at this station are supposed not to be equalled by those discovered at any other in Britain. The principal of these remains is a Roman altar, about five feet high, of curious workmanship, and ornamented on every side with sculptures and inscriptions.

Near the port stands Nether-hall, the seat of the Senhouse family, where the relics found at the station are chiefly preserved. This mansion was formerly called Aneburgh-hall, and Ellenborough-hall. Hutchinso's History, &c. Cumberland. Beauties of England, vol. iii.

MARYSBURGH, a township of Upper Canada, in Prince Edward county, situated at the eastern end of the peninsula, which forms the bay of Quinto, and lies open to lake Ontario on the south.

MARYSVILLE, a post-town of America, in Knox county, Tennessee; 561 miles from Washington.

MARYTOWN, a town of Scotland, in the county of Angus; 5 miles E.S.E. of Brechin.

MARYVILLE, the county-town of Blount county, in the state of Tennessee.

MARZA, a town of Sicily, in the valley of Noto, where they manufacture salt; eight miles S.S.E. of Noto. —Also, a town of Africa, in the desert of Zanhaga, inhabited by Moors, who trade with Europeans for gum, of which there are three forests near.

MARZA el Bir, a town of Arabia; 10 miles W. of Hali.

MARZA Eran, a town of Arabia; 12 miles S. of Sockia.

MARZA Ibrahim, a town of Arabia; five miles S. of Serrain.

MARZA Kouf, a town of Arabia; 35 miles S. of Mecca.

MARZA Sufa, a town of Africa, in the kingdom of Barca; six miles N. of Curen.

MARZAGLIA, a town of Italy, in the department of the Panaro; four miles W. of Modena.

MARZANO, Str., a town of Naples, in the province of Otranto; 12 miles S. of Tarento.

MARZILLA, a town of Spain, in the kingdom of Navarre; 30 miles S. of Pamplona.

MARZOAN, a mountain of Egypt, near the coast of the Red sea; 15 miles from Cosseir.

MAS BAY, a bay in the North sea, on the coast of Norway. N. lat. 60° 50'. E. long. 5° 30'.

MAS d'Agensis, a town of France, in the department of the Lot and Garonne, and chief place of a canton, in the district of Marmande, situated on the Garonne; six miles E.S.E. of Marmande. The place contains 1600, and the canton 6515 inhabitants, on a territory of 82½ kilometres, in seven communes.

MAS d'Azil, a town of France, in the department of the Arriège, and chief place of a canton, in the district of Mirepoix, fortified by the Protestants, but since dismantled; 25 miles W. of Mirepoix. The place contains 2482, and the canton 9969 inhabitants, on a territory of 177½ kilometres, in 15 communes.

MAS Cabardes, Le, a town of France, in the department of the Aude, and chief place of a canton, in the district of Carcassonne; one mile N. of Carcassonne. The place contains 670, and the canton 6093 inhabitants, on a territory of 175 kilometres, in 16 communes.

MASA, a town of Congo; 20 miles N.E. of St. Salvador.

MASACCIO, or **TOMASO DA SAN GIOVANNI**, in *Biography*, was born at Castello di San Giovanni, nel Valdarno, in the duchy of Florence. Concerning the period of his birth there has been found considerable difference among the early biographers of artists; but Baldinucci, among other evidences, produces one most completely unanswerable, which proves that he was born in 1402. This decisive proof was found in the book of the fiscal chamber of Florence, concerning the taxes or customs paid by the inhabitants of the commune of Castell di San Giovanni in 1427; in which our Tomaso gives his portion, and describes himself as being in his twenty-sixth year, and his brother Giovanni in his twenty-first.

Mafaccio (for by this name Tomaso is best known) appears to have attached himself very early to the art of painting; for, at the age of 19, he was matriculated at the city of Florence as a painter; which would hardly have occurred, if he had not been at that time advanced considerably in his profession. His parents were descended of a noble stock, and had the means of enabling their son to follow with advantage the chosen object of his mind; and happy was it for the art, and the world, that for a while nothing impeded the progress of a man, whose extraordinary powers enabled him to extend the regions of art, to re-animate its almost torpid spirit, and shew to future ages how far its aid, morally and intellectually, might be cultivated for the benefit of mankind.

His father's name was San Giovanni di Mone, of the family of the Gudi. He was by profession a notary of the city of Florence; an office which, at that time, entitled him to respect, and presupposed a qualification for filling higher stations in the magistracy of that place. Finding his son Tomaso intent upon the practice of painting, he placed him as a scholar under Masolino da Panicale, who was at that time engaged in painting the chapel of the Brancacci nel Carmine. At the same time, the arts of sculpture and architecture began to revive; the former in the hands of Donatello and Ghiberti, and the latter also in those of Filippo Brunelleschi. With the works of these men Tomaso was captivated; and recognising in them the revival of the true taste observable in the antique, he attempted to apply it in painting, the inseparable companion of the sister

art of sculpture. How well he succeeded his works still testify, after a lapse of 400 years, or nearly. His is the glory of forming a new epoch in the art. One hundred and fifty years had passed from the time of Cimabue to Mafaccio: in that period a very considerable advance was made in the practice of painting, particularly by Giotto, the disciple of Cimabue; but still much was imperfect in design, in colour, in the imitation of the natural actions of the figure, of attitudes, relievò, and the more subtle graces of the art. Most of these Mafaccio filled up the want of, and gave a more perfect imitation, as well as a better choice of nature, than any of his predecessors; overcame many difficulties, which had been stumbling blocks to them; and opened the way to those great men who succeeded him, particularly to Raphael, who seems to have been born with a soul congenial to his, and who frequently imitated, and sometimes borrowed figures from him, which he was not always able to improve. He is said to have been the first who attained that most essential point, fore-shortening the feet properly, so as to make them appear to rest flat upon the ground, and which, till his time, had not been done; probably owing to the painters taking too near a view of their figures: when looking down upon the feet, and drawing them as so seen, they would of necessity make them appear almost perpendicular. Mafaccio discovered the evil of this, and taking a proper distance for his view, and a just point of sight, gave their proper effect. For this he was indebted to perspective, the principles of which were imparted to him by Brunelleschi.

He attempted to compose and draw the nude or naked figure, in more varied actions than his predecessors had dared to attempt; and though his figures are frequently imperfect, and in a style tame and insipid, yet he sometimes wonderfully succeeded, particularly in the actions of the limbs: and in his heads, and the foldings of drapery, he still upholds his station with the best.

So much skill, and so great a novelty in the art of design, soon drew him into notice; and the city of Florence wished to employ his talents. His industry keeping pace with his powers, the productions of his pencil were of course very numerous: but, alas! few now remain to testify concerning him; and of these, the greater part disfigured by time, and by ignorance, which, pretending to secure, has only hastened their destruction. Baldinucci, who wrote in 1680-90, says, that in his time, though much had been destroyed, yet sufficient remained in Florence of the works of our artist, to prove the vast extent of his study and his labour; to which he applied so fervently, that he neglected every thing which did not appertain to his art, not even collecting the money owing to him for his pictures, and being entirely negligent of his person; so that from thence he acquired the name of Mafaccio, and is by that so much better known than his own, that we have thought it proper to place our account of him under it, rather than that of Tomaso da San Giovanni. He was engaged to adorn the principal churches and convents in Florence; but, after having for some time employed himself there, he was stimulated by a desire either to see the works of the ancients, those of contemporary artists, or for the benefit of his health, to travel to Rome, where his high merit was also recognised, and was called into practice. Among other works he painted, in a chapel of the church of Santa Maria Maggiore, a picture of Santa Maria della Neve, with four saints; in which was the portrait of pope Martin, painted from life, with a spade in his hand, marking out the foundations of that church; and also that of the emperor Sigismundo II. Vasari says that Michael Angelo thought it worth while to study this pic-

ture, which he praised highly. Whilst he was thus honourably employed at Rome, he heard that his friend and protector Cosmo di Medici was again stationed at the head of affairs at Florence, and immediately returned there. Upon his arrival he found his master Masolino dead, leaving incomplete several pictures in the chapel of the Brancacci, the finishing of which was immediately entrusted to Masaccio, who, to the designs already begun by Panicali, added many others, which still remain monuments of his superior ingenuity. While he was engaged in adorning the Chiesa del Carmine, a procession of the host occurred, which gave rise to a picture in fresco (in which style all his works are executed) of the peculiarities of that ceremony. This he painted over a door which led to the adjoining convent, and which is now destroyed. In it he represented a great number of citizens marching in procession, five or six abreast, with a propriety and variety of action, and in so just a perspective gradation of form and colour, as perfectly astonished the beholders. Among others, he introduced his friends Brunelleschi, Donatello, Masolino, Antonio Brancacci, who endowed the chapel, &c.

Thus successfully and usefully ran the course of Masaccio's life till he arrived at the age of forty-one, when he was suddenly snatched from his honours and the world by the remorseless hand of death, not without suspicion of poison having been administered by some envious or malignant person. This unhappy event caused universal grief throughout the city of Florence; and Brunelleschi observed, that, in the death of Masaccio, the professors of the art had sustained the greatest loss which could possibly have befallen them. The works, however, which he had so ingeniously wrought, remained for their instruction; and almost all the enlightened artists who then lived, and who immediately followed, to carry the art to its utmost pitch, failed not to study and benefit by the superior qualities of this extraordinary man. Amongst them were Lionardo da Vinci, Michael Angelo, and Raphael; and when such men as these three thought his labours worthy of their study, little more need be added in their praise.

MASAFFRAN, in *Geography*, a river of Algiers, which forms the boundary towards the north between the provinces of Tremecen and Titterie. It is formed by the union of several smaller streams, and runs into the Mediterranean. N. lat. $36^{\circ} 40'$. E. long. $3^{\circ} 13'$.

MASAFUERO, an island in the South Pacific ocean, first seen in 1563, and situated W. of Juan Fernandez, both being nearly in the same latitude, and distant, by the globe, about 31 leagues. It is very high and mountainous, and at a distance appears like one hill or rock; its form is triangular, and its circumference about seven or eight leagues. The south part, first seen by Capt. Carteret in May 1767, when he first made the island, at the distance of 23 leagues, is much the highest: on the north end there are several spots of clear ground, which, perhaps, might admit of cultivation. In the account of lord Anson's Voyage it is said, that only one part of this island affords anchorage, which is on the N. side, and in deep water; but Capt. Carteret saw no part where there was not anchorage. On the W. side, in particular, there is anchorage at about a mile from the shore, in twenty fathom, and about two and a half miles, in forty and forty-five fathom, with a fine black sand at the bottom. In the same voyage it is also said, that there is a reef of rocks running off the eastern point of the island about two miles in length, which may be seen by the sea breaking over them; but this, according to Capt. Carteret's account, is a mistake, as there is no reef of rocks or shoal

running off the eastern point, but there is a reef of rocks and sand running off the western side, near the S. end of it. The author of Anson's Voyage is also mistaken as to the distance of this island from Juan Fernandez, and its direction, for, he says, the distance is twenty-two leagues, and the direction W. by S.; but Capt. Carteret found the distance nearly one-third more, and the direction is due W., the latitude of both islands being nearly the same. The goats formerly mentioned in Anson's Voyage were found by our later navigators in great abundance, and equally easy to be caught. On the S.W. point of the island there is a remarkable rock with a hole in it, which affords a good mark to come to an anchor on the western side, where is the best bank of any about the place. About a mile and a half to the northward of this hole, there is a low point of land, and from this point runs the reef just mentioned, in the direction of W. by S. to the distance of about three quarters of a mile, where the sea continually breaks upon it. To anchor, run in till the hole in the rock is shut in, about a cable's length upon this low point of land then bearing S. by E. $\frac{1}{2}$ E., and anchor in twenty and twenty-two fathom, fine black sand and shells. There is anchorage also at several places on the other sides of the island, particularly off the N. point, in fourteen and fifteen fathom, with fine sand. All round the island there is plenty of wood and water, but they cannot be procured without difficulty; as a great quantity of stones, and large fragments of the rock have fallen from the high land every where round the island, and upon this the surf breaks to such a degree, that a boat cannot come with safety within a cable's length of the shore. Masafuero is a good place for refreshment, especially in the summer season. We have already mentioned the goats, and there is round the island plenty of fish, which may be easily caught; such as excellent coal-fish, cavallies, cod, hollibut, and cray-fish. King-fishers, sharks, and seals are numerous. The latter animals yield excellent train-oil, and their hearts and plucks are good food, somewhat resembling in taste the hog; and their skins are covered with very fine fur. On this island are many birds, and some very large hawks. S. lat. $33^{\circ} 45'$. W. long. $80^{\circ} 46'$. Hawkefworth's Voyages, vol. i.

MASAGRAN, or MASACHRAN, a town of Algiers, in the province of Tremecen, surrounded with mud walls, and seated on the declivity of a range of hills, within a furlong of the Mediterranean; 20 miles N. of Arzew. Shaw's Travels, p. 15.

MASAI BPET, a town of Hindoostan, in Golconda; 28 miles N.N.W. of Hydrabad.

MASAN, a town of Mocaumpour; 44 miles S.W. of Mocaumpour.

MASANET, a town of Spain, in Catalonia; 17 miles S. of Gerona.

MASANI, a town of Servia; 30 miles S. of Passarowitz.

MASARA, a town of Algiers; 12 miles N. of Constantina.

MASARINO, in *Ornithology*, a name given by the Portuguese in the Brazils, to a large bird of the curlew kind, approaching to the goose in size; and more commonly known by its Brazilian name *curicaca*.

MASARUOLO, in *Geography*, a town of Italy, in Friuli; 5 miles N. of Friuli.

MASAYA, a town of Mexico, on the west side of the lake of Nicaragua; 10 miles N. of Granada.

MASBATE, one of the Philippine islands, about 90 miles in circumference, the inhabitants of which are, for the most

part, free and independent. Tribute is paid by about 250 families. The chief produce of this island is rice. It has some mines, but they are not wrought. N. lat. $12^{\circ} 18'$. E. long. $123^{\circ} 20'$.

MASBOTHÆI, or ΜΕΣΒΟΘΗΛΙ, the name of a sect, or rather of two sects: for Eusebius, or rather Hegeſippus, whom he cites, makes mention of two different sects of Masbothæans. The first was one of the seven sects that arose out of Judaism, and proved very troublesome to the church; the other was one of the seven Jewish sects before the coming of Jesus Christ.

The word is derived from the Hebrew שבת, *ſhabat*, to rest, or repose, and signifies idle, easy, indolent people. Eusebius speaks of them, as if they had been so called from one Masbothæus, their chief; but it is much more probable that their name is Hebrew, or at least Chaldaic, signifying the same thing with a Sabbatarian in our language, that is, one who makes profession of keeping Sabbath.

Valesius will not allow the two sects to be confounded together; the last being a sect of Jews before, or at least contemporary with Christ; and the former a sect of heretics descended from them. Rufinus distinguishes them in their names; the Jewish sect he calls *Masbothæi*; and the heretics *Masbothæani*. The Masbothæans were a branch of the Simonians.

MASCALAT, in *Geography*, a town of Arabia, in the province of Oman; 240 miles W.N.W. of Oman.

MASCALL, an island in the bay of Bengal, near the coast of Aracan, about 50 miles in circumference. N. lat. $21^{\circ} 40'$. E. long. 92° .

MASCAR, or MASCARA, formerly *Viſtoria*, a town of Algiers, and capital of a province of the same name, sometimes called Tremecen, from the most considerable town in it. This town is the residence of the bey, and the only place in the whole kingdom which, under the domination of the Turks, flourishes and perceptibly increases in prosperity. It is indeed smaller than Tremecen and Sherſhel; but surpasses them in beauty, and the modern appearance of the houses, and it is daily enlarging in extent. Mascara is situated in the centre of a district abounding with corn-fields, and embellished with numerous small villages. So late as in the time of Shaw (1732) it was but an inconsiderable place; but at present it has a great number of good houses, newly erected mosques, and a strong castle, in which the bey resides, and is attended by a numerous and splendid retinue. The Bedouins in its vicinity are exempt from taxes, and merely serve as volunteers in cases of necessity; 40 miles E.S.E. of Oran.

MASCARAIB, or MASERIB, a town of Syria, belonging to a powerful Arabian prince; three days' journey S.S.E. from Damascus.

MASCARDI, AUGUSTIN, in *Biography*, an Italian, was born of a good family, at Sarzana, in the territory of Genoa, in the year 1591. In early life he entered himself among the Jesuits, which society he quitted upon the invitation from pope Urban VIII., who made him his chamberlain, and nominated him to the professorship of eloquence in the college of Sapienza at Rome. He died at the age of 49, and he is spoken of by cardinal Bentivoglio, who was his most intimate friend, as one of the most learned and eloquent persons of his time. He was author of many works, of which, the most valuable is on "The Art of writing History," first published in 1636, and reprinted with additions by Pirani in 1646. He published an account of the conspiracy of Fiesco in 1629, and the work of cardinal de

Retz on the same subject is only a free translation of that of Mascardi. Moreri.

MASCARENHAS, in *Geography*, a town of Portugal, in the province of Tras-los-Montes; 4 miles N. of Mirandola. See also *Isle of Bourbon*.

MASCARI, a town of Sicily, in the valley of Demona; 9 miles S.W. of Taormina.

MASCARIN, one of the Gallapagos islands in the Pacific ocean. S. lat. $1^{\circ} 12'$.

MASCAT, or MASKAT, a town of Arabia, in the territories of the Imam of Oman. This is the most important and best known city in these territories; and hence the Imam is, by many travellers, called "king of Maskat." It stands at one end of a beautiful plain, near a small gulf, encompassed with steep rocks, forming an excellent harbour, in which the largest vessels may find shelter. This harbour is likewise protected by forts; so that the city is fortified both by art and nature. Arrian calls it "Mosca," and speaks of it as being, even in his time, a great emporium of the trade of Arabia, Persia, and India. Maskat has ever enjoyed this advantage, and even at present possesses a considerable trade. The Portuguese made themselves masters of it in 1508. Two churches, one of which is now a magazine, and the other the house of the "wali," or governor, still remain to shew that they were once established here. About 150 years after their conquest of Maskat, the Portuguese were expelled by the Arabs, through the treacherous aid of a Banian, who had been robbed of his daughter by the Portuguese governor. The Banians are more numerous at Maskat than in any other city; their number amounting to 1200. They are permitted to live according to their own laws, to bring their wives hither, to set up idols in their chambers, and to burn their dead. At Maskat, Europeans pay 5 per cent. upon imports; Mahometans, $6\frac{1}{2}$; and Jews and Banians 7 per cent. The Imam's natural subjects pay 6 per cent. in kind, upon dates exported; and these are the principal article which the country affords. Maskat is distinguished by the strictness of its police; so that a stranger may walk in the streets any hour of the night without molestation. Theft is never pardoned; every person caught in the act either suffers death, or the loss of a hand; and therefore the merchandize lies at all times safe in the street; 220 miles S.S.E. of Gambron. N. lat. $23^{\circ} 22'$. E. long. $74^{\circ} 50'$. Niebuhr.

MASCATLAN, a town of Mexico; 60 miles from Acapulco.

MASCAU, a town of the duchy of Stiria; 8 miles S.E. of Windisch Weitritz.

MASCAUTANS, an Indian nation, inhabiting near lake Michigan, and between that and the Mississippi. The number of warriors is 400.

MASCHARADA, in the *Italian Music*, is applied to music composed for the gestures of pantomimes, buffoons, mimics, and such grotesque characters.

MASCHARSKA, in *Geography*, an island of Russia, in the Frozen sea, near the west coast of Nova Zembla. N. lat. 73° . E. long. $52^{\circ} 14'$.

MASCHERE SCENICHE, *Ital.*, dramatic masks of the ancients. So immense was the size of the theatres of Greece and Italy, that we may naturally conclude a musical declamation for the stage to have been a necessary consequence of speaking loud; for whoever shouts, halloos, or bawls, with sufficient force to be heard further than common speech can penetrate, makes use of fixed tones, which, if softened, would become musical; and it is well known that the tones of speech are too transient and undetermined to be

after-

ascertained by those of music, or to be audible at a great distance, or in a wide space.

This want of natural power of voice sufficient to be heard in the open air, for the ancient theatres had no cover, and by a great multitude, gave rise not only to singing upon the stage, but perhaps to chanting in the church. The necessity of augmenting the force of a performer's voice by every possible means, first suggested the idea of dramatic masks, which were used by the actors upon the principle of speaking trumpets.

The mask was called by the Latins *persona*, from *personare*, to sound through; and delineations of such masks as were used in each piece were generally prefixed to it, as appears from the Vatican Terence. Hence *dramatis persona*, masks of the drama; which words, after masks ceased to be used, were understood to mean *persons of the drama*.

Quintilian, lib. ii. gives a list of invariable masks appropriated to different characters, to which the public had for many ages been accustomed. And Julius Pollux is still more ample in his account of theatrical masks, used in tragedy, satire, and comedy. Niobe, weeping; Medea, furious; Ajax, astonished; and Hercules, enraged. In comedy, the slave, the parasite, the clown, the captain, the old woman, the harlot, the austere old man, the debauched young man, the prodigal, the prudent young woman, the matron, and the father of a family, were all constantly characterised by particular masks. This custom is, in some measure, still preserved in the Italian comedy, and in our pantomime entertainments, which originated from it.

MASCHIGIKA, in *Geography*, a bay on the N.W. coast of Nova Zembla. N. lat. 76° 25'. E. long. 59° 14'.

MASCITI, MICHELE, in *Biography*, an Italian performer on the violin at the beginning of the last century, and a voluminous composer for that instrument. In Le Cene's catalogue at Amsterdam for 1729, there is a list of seven of his works, engraved on copper, consisting of solos, duets, sonatas, and concertos.

MASCLE, or MACLE, in *Heraldry*, a bearing which differs both from the lozenge and fusil in this respect, that according to the sentiments of all authors, it should be exactly square and voided.

According to Guillim, the mascle represents the mesh of a net, and is an honourable bearing. It only differs from a lozenge, by being voided.

When any coat, in which one or more mascles are borne, is to be blazoned, it is necessary to mention their number, and how they are placed; and if they are conjoined, that circumstance must also be mentioned.

MASCLEF, FRANCIS, in *Biography*, a learned French priest and orientalist, was born at Amiens about the year 1672. He was educated for the church, and while he was very young, applied himself most diligently to the study of the sacred scriptures, and with this view he made himself master, not only of the Greek and Hebrew languages, but also of the Syriac, the Chaldee, and the Arabic. He obtained considerable preferment in the church, and to assist the young clergy in their pursuits, he drew up "A Course of Philosophy," and "A Course of Divinity," which he intended for publication, but was from various unforeseen circumstances obliged to relinquish his design. His application to study, and his abstemious manner of living, irreparably injured his health, and he died in 1728, at the age of sixty-six. He was the author of "Ecclesiastical Conferences in the Diocese of Amiens, on the Duties and Obligations of the Ecclesiastical State, and on the principal Truths of Religion;" and some controversial pieces. But

his celebrity with posterity chiefly rests on his "Grammatica Hebraica," which is a work of great merit, and does high honour to the author's erudition and his latinity. This was first printed at Paris in 1716, and the author's attack upon vowel points involved him in a controversy with M. Guarin, a learned Benedictine monk. In 1730, Masclef, in conjunction with the abbé de la Bletterie, one of the fathers of the oratory, published the second edition of his grammar in two volumes, 12mo.; the first consisting of the original work greatly enlarged; and the second containing three other grammars, viz. the Chaldee, the Syriac, and the Samaritan, together with a reply to the objections of M. Guarin, entitled "Novæ Grammaticæ Argumenta ac Vindiciæ."

MASCOBU, in *Geography*, a town of New Mexico, in the province of Mayo; 110 miles N.E. of Santa Cruz.

MASCULINE, something belonging to the male, or the stronger of the two sexes.

MASCULINE is more ordinarily used, in *Grammar*, to signify the first and worthiest of the genders of nouns.

The masculine gender is that which belongs to the male kind, or something analogous to it.

Most substances are ranged under the heads of masculine or feminine. This, in some cases, is done with a shew of reason, but in others it is merely arbitrary; and on that account, is found to vary according to the languages, and even according to the words introduced from one language into another. Thus, the names of trees are generally feminine in Latin, and masculine in the French.

Farther, the genders of the same word are sometimes varied in the same language. Thus *alvus*, according to Priscian, was anciently masculine, but is now become feminine. And *navire*, a ship, in French, was anciently feminine, but is now masculine. See GENDER.

MASCULINE Rime, in the *French Poetry*, is that made with a word which has a strong, open, and accented pronunciation; as all words have, excepting those which have an *e* feminine in their last syllable.

For instance, *amour* and *jour*, *mort* and *fort*, are masculine rimes; and *père* and *mère*, *gloire* and *memoire*, are feminine. Hence also verses ending with a masculine rime, are called masculine verses; and those ending with a feminine rime, feminine verses.

It is now a rule established among the French poets, never to use above two masculine, or two feminine verses successively, except in the looser kinds of poetry.

Marot was the first who introduced this mixture of masculine and feminine verses; and Ronfard was the first who practised it with success. The masculine verses in French, should always have a syllable less than the feminine ones.

MASCULINE Signs. Astrologers divide the signs, &c. into masculine and feminine; by reason of their qualities, which are either active, and hot, or cold, accounted masculine; or passive, dry, and moist, which are feminine.

On this principle they call the Sun, Jupiter, Saturn, and Mars, masculine; and Moon and Venus, feminine. Mercury, they suppose, partakes of the two. Among the signs, Aries, Libra, Gemini, Leo, Sagittarius, and Aquarius, are said to be masculine; Cancer, Capricornus, Taurus, Virgo, Scorpio, and Pisces, are feminine.

MASDEVALLIA, in *Botany*, a word of whose derivation we have no account, but it should seem to be formed of some proper name. Prod. Fl. Peruv. et. Chil. tab. 26. Swartz Orchid. in Schrad. N. Tourn. v. 1.

99. *Clafs and order, Gynandria Monandria. Nat. Ord. Orchideæ.*

Gen. Ch. *Cal.* Perianth fuperior, of one leaf, bell-shaped, three-cleft; its fegments ovate, terminating in two fmall horns, the upper one rather the fhorteft. *Cor.* Petals two, oblong, oblique, fmall, the foremoft angle at their bafe moft prominent, their inner margin approaching the fyle. Lip ovate, entire, flightly keeled, fomewhat ftalked, enclosed within the calyx. *Stam.* Anther a terminal hemifpherical lid; mafles of pollen ovate, ftalked, in pairs. *Pift.* Germen inferior, oblong; fyle fhort, gibbous, channelled in front; ftigma in the fore part, concave. *Peric.* Capfule oblong.

Eff. Ch. Calyx of one leaf, bell-shaped, three-cleft. Lip ovate, fomewhat ftalked, fhorter than the calyx. Anther a terminal lid, deciduous.

1. *M. uniflora.* Syft. Veg. Peruv. et Chil. 238. The Peruvian name is *Hwaffabwaff*.

By the above generic defcription, taken from profeffor Swartz's work, it is eafy to fee the propriety of confidering, as we have always done, the two inner leaves of the flower in *Orchideæ* as petals, not as leaves of the calyx; the latter part being, in this inftance, of one piece, and fo diftinct from the leaves in queftion, that Dr. Swartz is obliged to term them an inner calyx. See our account of *CYMBIDIUM, DENDROBIUM, DIURIS, EPIDENDRUM, LIMODORUM,* &c.

MASEBA, in *Geography*, a town of Sweden, in Weft Gothland; 54 miles E.S.E. of Gotheborg.

MASELSKOL, a town of Ruffia, in the government of Archangel; 20 miles S. of Kola.

MASENO, a village of the Valteline, celebrated for its baths; eight miles E.S.E. of Chiavenna.—Alfo, a river which riles in the Alps, and runs into the Adda; four miles E. of Morbegno.

MASERA, a town of Arabia, in the province of Oman, on the coaft; 70 miles S.S.E. of Kalhat. N. lat. 22°.

MASERATA, a town of the duchy of Piacenza; 18 miles S. of Piacenza.

MASH, the name of a drink given to horfes or cattle. It is made of half a peck of ground malt, put into a pail; on which is poured as much hot fcaolding water as will wet it well; then ftirring it about half an hour, till it becomes lukewarm, and fweet like honey, it is to be given to the horfe.

A mafh is only given after a purge, to make it work better; after hard labour, or for drink in time of ficknefs.

MASHAM, in *Geography*, a market town and parifh, partly within the liberty of St. Peter of York, and partly in the wapentake of Hang-Eaft, in the North Riding of Yorkfhire, England. It is fituated on the river Ure, at the diftance of nine miles from Rippon and 224 from London; and contained, according to the population return in the year 1801, 152 houfes, occupied by 1022 perfons. In the church, which is a handsome ftructure with a fine fpire, is a monument for fir Marmaduke Wyvill; and in the church-yard the lower half of a crofs, adorned with compartments of men and animals in relief. Leland mentions this town as "Maffeham, a praty quick market town and a fair church. Several of the Scropes of Mafham were buried in York Minfter. Wiville dwilith a litle above Mafham on the further ripe of Ure." A weekly market is held in this town on Tuefdays, and three fairs annually. In the vicinity of Mafham flood Jervaux abbey, founded in 1145 for Ciftertians: at the difolution, the feite

was granted to the earl of Lennox. From the fragments of ruins which are fcattered over a great extent of ground, the outward walls appear to have been a mile in circumference. At Swinton, near Mafham, is the feat of the Danby family. At Clifton, a fhort diftance from the town, are the remains of a large building of ancient architecture, which was formerly the manfion of the lords Scroop of Mafham. Camden's *Britannia* by Gough, vol. iii. *Daye's Tour* in Yorkfhire, 8vo.

MASHANGUR, a town of Candahar, in the province of Cabul, on the river Sewad; 48 miles N. of Attock. N. lat. 33° 54'. E. long. 71° 7'.

MASH-ELSON, in *Agriculture*, a term ufed to fignify a mixture of wheat and rye, or what is fometimes called meflin. See **MESLIN**.

MASHUK, in *Geography*, a town of the Arabian Irak; 5 miles N.W. of Samira.

MASIADY, a town of Samogitia; 36 miles N.N.W. of Medniki.

MASJAN, a river of Perfia, which runs into the Sihon, in the province of Khorafan.

MASIDE, a fmall town of Spain, in the province of Galicia; 12 miles N.W. of Orenfe.—Alfo, a fmall ifland in the Eaft Indian fea. S. lat. 7° 25'. E. long. 130° 35'.

MASIN, a town of France, in the department of the Dora; five miles S.E. of Ivrea.

MASINA, a kingdom of Africa, fituated on the upper fide of the river Niger, S.E. of Beero, N. of Bambarra, and adjoining to Tombuctoo, which lies to the N.E. This ftate belongs to the Foulahs, who are chiefly occupied in paffurage, and who pay an annual tribute to the king of Bambarra. N. lat. 14° 50' to 16°. W. long. 0° 3' to 3°.

MASINGA, a town of Cacongo. S. lat. 5° 10'. E. long. 12° 8'.

MASIVAN, or **MERZIFON**, a town of Afatic Turkey, in the government of Sivas; 90 miles N.W. of Sivas.

MASIUS, **ANDREW**, in *Biography*, was born in a fmall village near Bruflels, but at what particular year is uncertain. He purfued his academical ftudies at the univerfity of Louvain, where he carried away the firft honours in the clafs of philofophy, in 1553, when he was ftill a boy. After this he applied himfelf to the ftudy of the civil and canon law, and was nominated counfellor to the duke of Cleves. He was a moft extraordinary linguift, and was deeply learned in the ancient and oriental languages, as well as in all modern European tongues. He filled feveral confiderable offices in the ftate, at Vienna and Conftantinople. By order of Philip II., king of Spain, he was fent to Antwerp, and afociated with Montanus and Fabricius, &c. in publishing the Bible Royal, or Antwerp Polyglot. He died in the territory of Cleves, in the year 1573. His works are numerous, chiefly grammatical and theological: of which we notice the "*Grammatica Syriaca*:" "*Syrorum Peculum*," or an explanation of peculiar words, which occur frequently in Syriac writers: "*Lexicon Græcum, et Græcæ Linguae Inftitutions*." Moreri.

MASK. See **MASQUE** and **MASCHERE**.

MASK-Lough, in *Geography*, the name of a large lake between the counties of Mayo and Galway, in Ireland. It has to the north a communication with lough Carrah; and there is fuppofed to be a fubterraneous channel, by which the fuperfluous waters of both are difcharged into lough Corrib, near the village of Cong. Beaufort.

MASKALWA, a town of Ruffia, in the government of Irkutsk, on the Angara; 24 miles N. of Balaganfkoï.

MASKE.

MASKELYNE.

MASKELYNE, NEVIL, in *Biography*, an eminent astronomer and mathematician, who filled the important office of astronomer royal of England for the long period of 46 years, with the highest credit to himself, and with great advantage as well as honour to his country. He was descended from a good family long settled in Wiltshire, and was born in London in the year 1732. At nine years of age he was placed at Westminster school, where he continued until he was fifteen, and where he made a distinguished progress in classical learning. He also paid due attention to English literature; but manifested a particular desire to understand astronomy, and the construction of optical instruments. This predilection, it is said, was considerably increased on seeing the memorable solar eclipse of 1748, exhibited through a large telescope in a camera obscura. It is, indeed, highly probable that so unusual a phenomenon might have made a strong impression on his susceptible mind, and stimulated him to those exertions which led to his future eminence. From this period he applied himself with ardour to the study of astronomy and optics; but soon experienced the necessity of laying a proper mathematical foundation for those sciences; and he therefore turned his attention to the elements of geometry and algebra, which he learned in a few months without the help of a master. Thus, like most other eminent mathematicians, he may be considered, in a great measure, as self-taught; but, contrary to the usual course of such studies, his early turn for astronomy led to his mathematical attainments.

In 1749, he was entered at the university of Cambridge: he was first placed at Catherine-hall, but soon after removed to Trinity-college, where he pursued his favourite studies with increased success; and, on taking his first degree, received distinguished honours from the university. He took his several degrees at the following periods, A. B. in 1754; A. M. in 1757; B. D. in 1768; and D. D. in 1777.

As soon as he was of age for holy orders, he was ordained to the curacy of Barnet, where he officiated for some time; and where he devoted most of his leisure hours to the study of practical astronomy.

In 1756, he became a fellow of his college, and though it was several years before he took his doctor's degree, we shall henceforward mention him under the title of doctor, as that by which he has been so long and so familiarly known to the scientific world.

In 1758, he was elected a fellow of the Royal Society, and he soon after became an important contributor to the *Philosophical Transactions*. This learned body, who at that time paid particular attention to astronomical and mathematical subjects, selected him to go to the island of St. Helena, to observe the transit of Venus over the sun's disk, which was to take place June 6, 1761. As this observation was to settle an important element in astronomy (the sun's parallax), it excited much attention, and preparations were made in different countries for observing it with accuracy. Two other astronomers, *viz.* Mr. Charles Mason, and Mr. Jeremiah Dixon, were sent for the same purpose to Bencoolen; and his majesty, George II., granted supplies for these expeditions. The French king likewise sent astronomers, to observe the transit, to Pondicherry, to the island of Roderigo, and to the north of Siberia.

Dr. Maskelyne sailed for St. Helena on board the *Sea Horse* frigate, captain Smith, and remained ten months on the island, making astronomical observations and philosophical experiments. His observation of the transit of

Venus was not completely successful, owing to the cloudy state of the weather; but his voyage answered a more important purpose, and one far more useful to his country, than that originally intended: it afforded him an opportunity of taking lunar observations, which were now for the first time made with effect. This method of finding the longitude at sea had been long contemplated as a grand desideratum in navigation; and plans and preparations had been made for the purpose by Flamsteed, Newton, La Caille, Euler, Halley, Bradley, Mayer, and others: but the honour was reserved for Dr. Maskelyne to reduce their theories to successful practice. This he was enabled to do by means of Hadley's quadrant recently invented; and also by professor Mayer's lunar tables, for which a parliamentary reward of 3000*l.* was afterwards given on Dr. Maskelyne's report of their correctness. See our articles **GREENWICH**, **LONGITUDE**, and **LUNAR Observations**.

During the voyage, both outward and homeward, he exercised the officers on board in taking lunar observations, and taught them to clear the distances from the effects of parallax and refraction, and thence to find the longitude within certain limits. While on the island he made accurate observations on the tides, the variation of the compass, and the comparative gravity of bodies there and at London. He also observed the annual parallax of Sirius, and the horary parallaxes of the moon. The chief results of these operations are inserted in the *Philosophical Transactions* of the above period.

Soon after his return from St. Helena, he published his well-known work, entitled "*The British Mariner's Guide*," which contained, among various new and practical illustrations and articles in nautical astronomy, rules and examples for working the lunar observations; but, in order to shorten and simplify these laborious operations, other tables and calculations were still wanted, which he afterwards supplied by his *Nautical Almanac and Requisite Tables*.

In 1763, he undertook another scientific voyage by appointment of the lords of the Admiralty and the Board of Longitude. He sailed for Barbadoes, on board the *Princess Louisa*, admiral Tyrrel, for the following purposes:—To find the longitude of that island by astronomical observations; to determine the rate of going of Mr. Harrison's new time-keeper; and to try Mr. Irwin's marine-chair, which was intended for making steady observations at sea, but which did not answer. He was, besides, in the course of his voyage, to take lunar observations with a curious new Hadley's sextant, and to determine the longitude by the eclipses of Jupiter's satellites, and the occultations of fixed stars by the moon. All these objects of the expedition he executed to the entire satisfaction of his employers; and he likewise officiated as chaplain to the ship during the voyage.

In 1764, the office of astronomer royal became vacant by the death of Mr. Bliss, who had survived his appointment, as successor to Dr. Bradley, only two years. Dr. Maskelyne's celebrity immediately pointed him out as the most competent person to fill the situation. His reputation stood very high in the Royal Society, both as a profound mathematician, and an able astronomer; while his experience at sea, and, above all, his success in establishing the lunar observations, seemed to render him peculiarly well qualified to carry into effect the purpose for which the Royal Observatory had been established—that of preparing tables for finding the longitude at sea. Through want of this knowledge, it was said, that not only single ships, but whole fleets had been lost, which induced government to offer immense rewards for practical methods of determining the problem. When Mr. Flamsteed, the first astronomer royal, was appointed to the office

office in 1675, he was directed by king Charles II. "to apply himself with all diligence to the rectifying the tables of the motions of the heavens, and the places of the fixed stars, in order to find out the much desired longitude at sea, for the perfecting the art of navigation." These were the words of his commission, which have been since continued to his successors. Thus, the office of astronomer royal was justly considered of great national importance, and Dr. Maskelyne's appointment to it, which was announced in the London Gazette, Feb. 16, 1765, gave universal satisfaction. It should be noticed, that the office includes a seat at the Board of Longitude, *i. e.* a board formed of commissioners, who are appointed "for examining, trying, and judging all proposals, experiments, and improvements relating to the longitude."

During the long period of Dr. Maskelyne's official services, his time may be considered as chiefly occupied either at the Observatory, the Board of Longitude, or the Royal Society. His biography, therefore, like that of most other scientific men, consists chiefly in a history of his labours; and as they are very numerous, and likewise well known to the astronomical world, we shall state them in a brief and summary manner, referring our readers occasionally to publications where they are more particularly detailed.

Soon after his appointment, he laid before the Board of Longitude the plan of an annual publication, to be entitled the "Nautical Almanac, and Astronomical Ephemeris." The first volume was for 1767, and it has been continued, under his direction, up to the year 1816, inclusive, making in the whole fifty volumes, a lasting monument of labour and profound learning. It is universally allowed to be the most useful work on practical astronomy ever published. In such high estimation has it been held by foreign astronomers, that they have generally and implicitly adopted its computations, and acknowledged its superior accuracy. M. Lalande, in giving an account of similar publications, says, "Le Nautical Almanac de Londres est l'Ephéméride la plus parfaite qu'il y ait jamais eu."

In 1767, he published an auxiliary work, entitled "Tables requisite to be used with the Nautical Almanac, in order to find the Latitude and Longitude at Sea." This performance, well known to seamen by the name of "The Requisite Tables," has passed through several editions, and has been successively enlarged, particularly by different methods of working the lunar observations, by Messrs. Lyons, Dunthorne, Witchell, Wales, and by Dr. Maskelyne himself; and it has been also improved by the latitudes and longitudes of places supplied by captain Cook, captain Huddart, Messrs. Bailey, Wales, and other scientific navigators. Some time after this, he published Mayer's Tables, with both Latin and English explanations, to which he added several tracts and tables of his own, and prefixed to the whole a Latin preface, with the title "Tabulæ motuum Solis et Lunæ, &c." It was published, like the foregoing works, by order of the commissioners of longitude, and the various other publications issued by that Board during his time were also printed under his inspection, and are too numerous to be here stated.

Another important and laborious duty that devolved on him in consequence of his office was, to examine the pretensions of the various candidates, who claimed the parliamentary rewards for new or improved methods of finding the longitude.

It may be observed, that his appointment took place at a period peculiarly interesting in the history of astronomy. His success in introducing and promoting the lunar obser-

vations greatly excited the public attention to the subject of the longitude, which was rendered still more interesting by the great rewards held out by parliament for further improvements in the problem, whether by astronomical or mechanical methods. These offers, united with the powerful motives of honour and emulation, called forth, during several years, many extraordinary efforts of genius, and produced useful inventions both in arts and sciences, and particularly in the construction of time-keepers. See CHRONOMETER.

The parliamentary offers likewise encouraged numerous candidates of very slight pretensions, and even visionaries whose applications became very troublesome. The claims of all were referred by the Board of Longitude to the astronomer royal, by whom scientific plans were examined, and the rates of chronometers ascertained. Thus by his office he was constituted arbiter of the fame and fortune of a great number of anxious projectors; and it is easy to conceive how arduous as well as unpleasant such a duty must have been. It was not indeed to be expected that the sanguine hopes and self-love of such a variety of candidates could be gratified, with justice to the high trust and confidence thus reposed in him; and hence complaints were frequently heard, and pamphlets published, expressive of discontent and disappointment.—Appeals even were made to parliament; but whatever difference of opinion might have then existed, time and experience have since fully proved the truth and impartiality of Dr. Maskelyne's decisions.

In giving a general view of his labours at the Royal Observatory, we shall begin with his publication of the Greenwich observations, which were printed in 1774, by command of his majesty. The first volume began with the observations of 1765, and they have been continued annually since. M. Lalande, in mentioning this performance in 1792, calls it "le recueil le plus précieux que nous ayons." Since that period they have been considerably improved, and are universally allowed to possess an unrivalled degree of accuracy. His catalogue of the right ascensions and declinations of 36 principal fixed stars, with tables for their corrections, is a most useful and important performance, and is adopted in all observatories. It is mostly distinguished by the appellation of "Dr. Maskelyne's 36 Stars." His observations also of the sun, moon, and planets, are equally esteemed, and have been made the basis of the solar and lunar tables, lately computed in France according to the theory of M. Laplace; and which are republished in professor Vince's Astronomy, vol. iii. The solar tables were calculated by M. Delambre, and the lunar by M. Burg: copies of which have been transmitted to Dr. Maskelyne, by order of the French Board of Longitude, with the following grateful acknowledgment of the important assistance derived from his Greenwich observations. The letter is worthy of being recorded, as highly honourable to all parties, and as an interesting article in the history of astronomy. The following is a copy.

"Institut National, Classe des Sciences Physiques et Mathématiques, Paris, le 20 Fevrier, 1806. Le Secrétaire perpétuel pour les Sciences Mathématiques à Monsieur Maskelyne, Astronome Royal et Membre de la Société Royale de Londres.

"Monsieur, et respectable Confrère,

"Le Bureau des Longitudes me charge de vous offrir sept exemplaires des tables qu'il vient de publier. Cet hommage de sa haute estime et de sa reconnaissance étoit bien dû à l'auteur du plus grand et du plus précieux recueil d'observations qui existe. C'est à cette source que nous avons puisé Monsieur Burg et moi pour la plus exacte détermination des coefficients des équations lunaires et solaires, c'est

là que nous avons trouvé la confirmation des inégalités que la théorie peut bien indiquer, mais dont la valeur ne pourroit être fixée que par des calculs qui font encore au dessus des forces de l'analyse ; enfin, c'est à vous que nous devons la connoissance des mouvemens moyens et de toutes les constantes que l'observation seule peut donner. Recevez donc avec bienveillance, un ouvrage auquel vous avez si puissamment contribué. Nous serons très flattés si vous jugez nos tables dignes d'être employées aux calculs du Nautical Almanac, suivant l'apparence que nous en donne votre dernière préface."—DELAMBRE.

Such is the testimony to the superior accuracy of the Greenwich observations given by the great astronomers of France ; and it is truly gratifying to observe, that the hostile state of the two countries did not prevent friendly communications on astronomy. War should never extend to the sciences ; and least of all to that sublime study which does the highest honour to the human intellect, and which has rendered the most essential services to mankind.

It would greatly exceed our limits to enumerate all the corrections and improvements effected by Dr. Maskelyne's observations, many of which will be found in professor Vince's Astronomy, and in the Philosophical Transactions.

His communications to the Royal Society are distinguished, like his other productions, for great attention to utility as well as accuracy. They consist chiefly of astronomical observations ;—improvements of mathematical and optical instruments ;—computations of the eclipses of the sun, moon, and Jupiter's satellites ;—articles on parallaxes, light, vision, refraction, weights, measures, gravitation, &c. with calculations and predictions of comets ; making in the whole above thirty communications. It should be noticed that, in 1774, he went to Shehallien, in Perthshire, in order to ascertain the lateral attraction of that hill ; by which the mean density of the earth was computed, and its central attraction according to the Newtonian theory first demonstrated. For this paper he was presented by the Council of the Royal Society with sir George Copley's gold medal.

In the history of science, few persons can be mentioned who have contributed more essentially to the diffusion of astronomical knowledge than Dr. Maskelyne ; and perhaps no man has been so successful in promoting practical astronomy, both by land and sea. During his time private observatories became very general, though scarcely known before ; nor could such be made useful without his Nautical Almanac, and other tables, except by men of great science, and by very laborious calculations. Beside the assistance thus derived from his publications, he was always ready to give advice concerning any plans that were likely to promote the science. Among the observatories that were erected through his encouragement, may be mentioned that of the late Alexander Aubert, esq., whose excellent collection of instruments has been rarely equalled, even in national institutions. M. Lalande makes the following honourable mention of this gentleman and of his liberal pursuits.

"M. Alexandre Aubert, directeur des assurances, avoit fait un très joli observatoire qui étoit près de Greenwich, à Loam-pit-Hill, il a d'excellens instrumens de Bird, qui étoit son ami : il observe souvent et avec la plus grande exactitude. En 1788, il a transporté son observatoire à Highbury, une lieue au nord de Londres, au-delà d'Islington." *Astronomie, par Lalande, tom. i. p. xxxv.*

Several other instances might be adduced of observatories which were erected by the advice or direction of the astronomer royal. He was besides a great improver of instruments, and the inventor of some, among which may be noticed the

prismatic micrometer ; but though profoundly skilled in optics, and ingenious in mechanical contrivances, he always paid great deference to the opinions of opticians, and other practical mechanists.

His plans were mostly directed to substantial objects, while a steady perseverance gave an efficiency to all his undertakings : and notwithstanding his profound knowledge of physical astronomy, his attention was chiefly directed to reduce the scientific theories of his predecessors to the practical purposes of life. In this he was eminently successful, particularly in his labours for the longitude, by which he essentially contributed to the advancement of navigation, the prosperity of commerce, and the wealth, honour, and power of his country.

Thus, from Dr. Maskelyne's important labours, his public character is well known, and his fame immoveably established : and, as to his private character, it was likewise truly estimable. He was, indeed, exemplary in the discharge of every duty. In his manners he was modest, simple, and unaffected. To strangers he appeared distant, or rather diffident ; but among his friends he was cheerful, unreserved, and occasionally convivial. He was fond of epigrammatic thoughts and classical allusions ; and even sometimes indulged in playful effusions of this kind, as appears by the following lines, which he composed on seeing Mr. Russell's selenographia, or map of the moon, executed with so much exactness.

He makes Luna thus speak ;

"Me prope viderunt Actæon, Endymionque ;
Hos memini solos ; ast ubi Russellius ?"

which he thus translated,

"Actæon and Endymion saw me near ;
But when did I to Russell thus appear ?"

This epigram was composed extemporaneously when he was about seventy years of age, and is therefore the more worthy of being remembered as an instance of his lively and pleasant disposition at that advanced period. It also shews his passion for astronomy, which displayed itself so early in life, and which seemed to increase with his years.

Notwithstanding the doctor's numerous avocations he found time to maintain a regular correspondence with the principal astronomers of Europe. He was visited also by many illustrious foreigners, as well as eminent characters of his own country, but his warmest attachments were always manifested to the lovers of astronomy. Among his most intimate friends may be reckoned Dr. Herschel, Dr. Hutton, Messrs. Wollastons, Mr. Aubert, bishop Horley, sir George Shuckburgh, baron Maseres, professor Robertson ; and also professor Vince, whose publications so ably illustrate Dr. Maskelyne's labours, and whom he appointed the depositary of his scientific papers.

Dr. Maskelyne had good church preferment from his college ; and his paternal estates (of which he was the last male heir), were also considerable. He married, when rather advanced in life, a young lady of large fortune, the sister and co-heiress of lady Booth of Northamptonshire, by whom he had one daughter, whose education he superintended with the fondest care. These ladies survive him, and also his sister Margaret, who was married to Robert, the late lord Clive.

Dr. Maskelyne died on the ninth of February 1811, in the 79th year of his age. His health previously declined for some months ; and he contemplated his approaching dissolution with pious resignation, and with a lively hope of being admitted into the presence of that Deity, whose works he had so long studied and so ardently admired. His favourite science tended the more strongly to confirm his religious principles, and he died, as he had lived, a sincere Christian.

MASKELYNE'S *Islands*, in *Geography*, so called after Dr. Maskelyne, a cluster of small islands in the South Pacific ocean, lying off the south-east point of Mallicollo island. N. lat. 16° 32'. E. long. 167° 59'.

MASKINGIE, a river of Canada, which runs into lake Michigan, N. lat. 47° 25'. W. long. 86° 30'.

MASKO, a town of Sweden, in the government of Abo; 9 miles N.W. of Abo.

MASLACH, in the *Materia Medica* of the Turks, the name of a medicine greatly in use among those people, and called also *anfion* or *ambion*. It is prepared principally of opium. They take a dram of it at a time, and sometimes two or three: they always use it when going to battle, and very often as a provocative to vehery, as they do the crude opium.

MASLAWSTANO, in *Geography*, a town of Poland, in the palatinate of Kiev; 36 miles E.S.E. of Bialacerkiev.

MASLEMA, a town of Asiatic Turkey, in the province of Diarbekir; 28 miles N.N.E. of Racca.

MASLIN. See BULLIMONY.

MASSED, in *Geography*, a small island of Denmark, near the S. coast of Zealand. N. lat. 54° 59'. E. long. 11° 54'.

MASOLINO DA PANICALE, in *Biography*, a painter, concerning the exact time of whose birth and death the biographers of the older artists differ exceedingly; one making him die at the age of 37, in the year 1415, another in 1418, and a third in 1440. It appears most probable, from a circumstance mentioned in the life of Masaccio, that the truth lies nearer the latter than the former periods; and that he must have lived somewhat longer than 37 years. In the first place, all agree that Masaccio, who was born in 1402, was taught the art of painting by Masolino, whom he saw executing his labours in the chapel of Brancacci, in the church of St. Pietro al Carmine at Florence, and again it is said by the same biographers, that Masaccio learnt for the first time the death of his master upon his return from Rome, at which time it is most probable he was 30 years of age, or thereabouts; and then was engaged to finish the pictures which Masolino had left incomplete, and not till then; which would hardly have been the case if Masolino had died in 1415, or 1418, since Masaccio was a reputed painter before he was 20 years old, and almost, if not quite, at the head of the profession before he was 25.

Panicale was in his early life employed as a goldsmith, and afterwards learnt under Lorenzo Ghiberti the arts of modelling and casting in bronze; and became one of Ghiberti's best workmen, particularly in clearing out the figures after casting. At the age of 19, he chose to study painting, and for that purpose engaged himself with Starnina. Few of the works of Masolino are now known. The principal ones are the hall of the Orfini palace at Rome; and his History of St. Peter in the church of St. Pietro, at Florence, above-mentioned. He seems to have greatly improved upon the style of the school of Giotto, and was probably led to it by having wrought with Ghiberti in sculpture. His style, though still dry and meagre, exhibited symptoms of a certain harmony and grandeur unknown before.

MASON, JOHN, an English nonconformist divine, was born at Dunmow, in Essex, in the year 1705-6. His father, who was a dissenting minister, sent him to pursue his academical studies under Mr. Jennings, of Kibworth, in Leicestershire. This was in the year 1722; and the first

situation which Mr. Mason had after he had completed his academical course, was that of chaplain and private tutor in the family of Mr. Feaks, at his seat near Hatfield. In the year 1729 or 30, he accepted an invitation to become pastor to a congregation at Dorking, in Surrey, with which he continued about seventeen years, diligently discharging the duties of his function, highly esteemed both as a preacher and friend. In 1745 he published his treatise on "Self-Knowledge," which is unquestionably one of the most valuable works on practical religion in the English language. It is probable that not less than a hundred thousand copies of this work have been circulated in our own country; and it has been translated into almost all the European tongues. In the year 1746, Mr. Mason removed to Chessunt, in Hertfordshire, where he spent the remainder of his days as a useful preacher, and continued to benefit, not only the village in which he lived by his public discourses and private exhortations, but to enlighten and improve the public by his writings. He died in February, 1763, in the fifty-eighth year of his age. As a divine, his most important publications are, 1. "The Lord's-day Evening Entertainment," in four volumes: 2. "The Student and Pastor; or Directions how to attain Eminence and Usefulness in those respective Characters;" 3. "Christian Morals," in two volumes: and "Fifteen Discourses, Devotional and Practical." Mr. Mason published, likewise, in the year 1750, "An Essay on Elocution," which was exceedingly well received, and went through three editions in a very short space of time, and may be considered as the foundation of many of our popular treatises on the same subject. Not long afterwards he published "An Essay on the Power and Harmony of Profaic Numbers;" and "An Essay on the Power of Numbers, and the Principles of Harmony in Poetical Compositions." In 1761, the author reprinted these and the "Essay on Elocution," in one volume, octavo. Besides the articles already mentioned, Mr. Mason published some single sermons preached on particular occasions. As a preacher his sermons were correct, perspicuous, nervous, always illustrative of the text and doctrine which he had undertaken to explain; and they were ever adapted to promote the purposes of piety and charity. In the pulpit he was grave and solemn, his voice was clear, his delivery deliberate, distinct, and void of all affectation, and his manner was easy and natural. His personal character was an exemplification of the duties and virtues which it was the business of his life to enforce; in his intercourse with the world, he was free, easy, communicative, and pleasant in conversation, and much of the gentleman appeared in all his behaviour. Although it is now nearly half a century since this excellent man was taken from our world, there is still a member of his church at Chessunt living, who cherishes, and will ever cherish, the recollection of the virtues of her pastor, so long as her life and faculties are continued. Life prefixed to the fifteenth edition of the treatise "On Self-Knowledge."

MASON, WILLIAM, an English poet of considerable celebrity, born in 1725, was the son of a clergyman who held the living of Hull. He was admitted of St. John's college, Cambridge, where he took his first degree in 1745. He removed to Pembroke college, and was elected a fellow in 1747; he obtained the degree of M.A. in 1749, and entered into holy orders in 1754. He obtained the patronage of the earl of Holderness, by whom he was presented to the rectory of Alton, in Yorkshire, and who procured for him the appointment of chaplain to his majesty. In 1749, he printed "An Ode on the Installation of the Duke of Newcastle," as chancellor of the university of Cambridge,

bridge, which gained him reputation. "A Monody to the Memory of Pope," and a poem, entitled "Isis, an Elegy," added to his fame, which was still farther increased, in 1752, by the dramatic poem of "Elfrida." In this, and in his "Caractacus," published in 1759, he attempted the restoration of the ancient Greek chorus in tragedy. Mr. Mason did not originally compose these pieces for the modern stage, which he considered as sunk beneath his level by the corrupt taste of the public; and though attempts were afterwards made to fit them for representation, and they were brought upon the theatre, they could obtain no permanent place there. In 1756, he published a small collection of new "Odes." He was in all his pieces an imitator of Gray, but they have been thought to display more of the artificial mechanism of poetry than of its genuine spirit. His "Elegies," published in 1763, are in general marked with the simplicity of language proper to this species of composition, and they breathe the noble sentiments of freedom and virtue. In the year 1772, appeared the first book of his "English Garden," a descriptive poem in blank verse, of which the fourth and concluding book was printed in 1781. The main object of this work was to recommend, by the charms of poetry, the modern system of natural or landscape gardening. In 1775, as a tribute to the memory of his friend Gray, he published the poems of that distinguished genius, to which are prefixed "Memoirs of his Life and Writings." Mason's observations on the character and genius of his friend did honour to his taste and feelings. This work was originally published in one quarto volume, but another edition was given to the public in four thin volumes, crown octavo. Mason, as has already been observed, was warmly attached to the principles of liberty: during the contest with America, he strongly expressed his disapprobation of the hostilities carrying on against the transatlantic part of the community. He was a zealous member of the Yorkshire Association, for procuring a reform in parliament, which, notwithstanding the exertions of the wisest patriots, and most virtuous of our countrymen, is still, apparently, at a great distance. Mr. Mason, in 1783, published in a quarto volume a translation of Fresnoy's Latin poem on the "Art of Painting," which unites great elegance of language and verification, with a correct representation of the original. As a clergyman, he obtained the preferments of precentor and canon-residentary of the cathedral of York; and at that church he preached, in 1788, an "Occasional Discourse," on the subject of the slave-trade, which was an animated declamation against the inhumanity of that traffic. In the same year he published the poems of the poet-laureate, Whitehead, to which he prefixed a memoir. The centenary commemoration of the revolution in that year, called forth a new exertion of his lyric powers in a "Secular Ode," which breathed the spirit of his muse of freedom. Without referring to the other publications of Mr. Mason, we may observe that he lived to witness the French revolution, the horrors of which wrought a complete change in his political principles. He died in April, 1797, at the age of 72. His character in private life was exemplary for worth and active benevolence; and a tablet has been placed to his memory in the Poet's Corner in Westminster Abbey. Gentleman's Magazine.

Mr. Mason was not only an excellent poet and able divine, but a dilettante painter and musician; and in these last capacities an acute critic. We did not, however, agree with him in his reforming schemes of church music. He had been himself a good performer on the harpsichord; had some knowledge of composition, a refined taste, and was

a very good judge of modern music; but his ideas of reforming cathedral music would reduce it to Calvinistical psalmody. He wished for nothing but plain counterpoint in the services and full anthems, and dull and dry harmony in the voluntaries, without melody, accent, or measure; and he preferred the mechanical execution of a barrel organ in church music, to the most judicious accompaniment of a consummate organist.

We think organ-playing, in the sublime style of Handel and Sebastian Bach, is so precious a faculty, that it should be cultivated and cherished as sedulously for the sake of the art of music, as the innocent amusement of the congregation.

Mr. Mason, as precentor of the cathedral of York, it is to be feared, has stripped music of all its ornaments, as Jack did religion, in the Tale of a Tub.

There are, however, many excellent reflections in his "Compendium of the History of our Church Music," and, in general, a just and discriminate character of our ecclesiastical composers, in his "Copious Collection of those Portions of the Psalms of David, Bible, and Liturgy, which have been set to Music, and sung as Anthems in the Cathedral and Collegiate Churches of England. To which is prefixed a critical and historical Essay on Cathedral Music." Printed at York in 1782.

Though this excellent scholar, and charming poet, honoured us with his friendship, of which we were always ambitious; and though, from his knowledge of music, we regarded him as the most intelligent and refined of our lyric bards, we never could subscribe to his reform of cathedral music, farther than in the accentuation of the words, and distinction of long and short syllables, in which our old cathedral composers, as well as psalmodists, are egregiously defective; nor could we ever flatter him in his high opinion of Henry Lawes, as a musician of superior genius and learning, or for his perfect accuracy in expressing words; though Milton tells us that his

"——— *tuneful* and *well-measur'd* song,
First taught our English music how to *span*
Words with just *note* and *accent*, not to *can*
With Midas-ears, committing short and long."

And Waller joins with Milton in saying, that other composers admit the poet's sense but *faintly* and *dimly*, like the rays through a church-window of painted glass; while his favourite Lawes

"——— could truly boast
That not *A syllable* is *lost*."

See HENRY LAWES, and COMUS.

MASON, a person employed, usually under the direction of an architect, in the raising of a stone building.

The word comes from the French *maçon*, which signifies the same. Some derive this farther from the barbarous Latin *machio*, a *machinist*, because these artificers are obliged to use machines for raising walls. Du-Cange derives it from *maceria*, a name given to the long fence-walls which inclose vineyards, &c. in which masons are supposed to have been first employed: "Mason est maceriarum constructor." M. Huet derives it from *mas*, an old word signifying *house*; hence mason is a person who makes *masses*, that is, *houses*. In the corrupt Latin, a mason was called *magister comacinus*, which Lindenbroeck derives from Comacina, an island in Romania, where, in the time of the Lombards, the best architects were found.

The chief business of a mason is to prepare the mortar,

raise the walls from the foundation to the top, with the necessary retreats and perpendiculars, form the vaults, and employ the stones as delivered to him.

When the stones are large, the business of hewing or cutting them belongs to the stone-cutters; though these are frequently confounded with the masons. The ornaments of sculpture are performed by carvers in stone, or sculptors. The tools or implements principally used by masons are the square, level, plumb-line, bevel, compass, hammer, chissel, mallet, saw, trowel, &c.

Beside the common instruments used in the hand, they have likewise machines for the raising of great burdens, the conducting of large stones, &c. The principal of these are the lever, wheel, pulley, &c.

In the estimation of the value of masons' work, walls, columns, blocks of stone or marble, &c. are measured by the cubic foot; and pavements, slabs, chimney-pieces, &c. by the superficial or square foot. Cubic or solid measure is used for the materials, and square measure for the workmanship. In the solid measure, the true length, breadth, and thickness, are taken and multiplied constantly together; in the superficial, there must be taken the length and breadth of every part of the projection, which is seen without the general upright face of the building.

Examples. 1. Required the solid content of a wall, 53 feet 6 inches long, 12 feet 3 inches high, and 2 feet thick. The product of $53.5 \times 12.25 \times 2 = 1310.75$, or 1310 feet 9 inches.

2. Required the value of a marble slab, at 8s. per foot; the length being 5 feet 7 inches, and breadth 1 foot 10 inches. Ans. 4l. 1s. 10¹/₂d.

3. In a chimney-piece, suppose the length of the mantle and slab each - - - 4 f. 6 inch.

Breadth of both together	3	2
Length of each jamb	4	4
Breadth of both together	1	9

Required the superficial content? Ans. 21 feet 10 inches. Hutton's Mensuration, p. 610.

MASONS, *Free* or *Accepted*, a very ancient society, or body of men; so called, either from some extraordinary knowledge of masonry or building, which they are supposed to be masters of, or because the first founders of the society were persons of that profession.

They are now very considerable both for numbers and character; being found not only in every country in Europe, but in other parts of the globe, and consisting principally of persons of merit and consideration. As to antiquity, they lay claim to a standing of some thousand years; and, it is said, can trace up their original as early as the building of Solomon's temple. It is very doubtful when they were first introduced into this country: some have traced the origin of masonry in general to the year 674, when glass-making was introduced; and it is certain that, after this time, many of our public buildings, in the Gothic style, were erected by men in companies, who, as some say, called themselves *free*, because they were at liberty to work in any part of the kingdom. Others have derived the institution of free masons from a combination among the masons not to work without an advance of wages, when they were summoned from several counties, by writs of Edward III., directed to the sheriffs, to assist in rebuilding and enlarging the castle, together with the church and chapel of St. George, at Windsor: accordingly it is said, that the masons agreed on tokens, &c. by which they might know one another, and to assist one another against being impressed, and not to work unless *free*, and on their own terms.

Dr. Henry, in his "History," attributes the origin of the free-mason society in Britain to the difficulty found in former times, of procuring a sufficient number of workmen to build the multitude of churches, monasteries, and other religious edifices which the superstition of those ages prompted the people to raise. Hence the masons were greatly favoured by the popes, and many indulgences were granted in order to augment their number. In times like those we speak of, it may well be supposed that such encouragement from the supreme pastors of the church must have been productive of the most beneficial effects to the fraternity: and hence the increase of the society may naturally be deduced. The doctor quotes, in confirmation of this, the words of an author who was well acquainted with their history and constitution. "The Italians," says he, "with some Greek refugees, and with them French, Germans, and Flemings, joined into a fraternity of architects, procuring papal bulls for their encouragement and their particular privileges; they styled themselves free-masons, and ranged from one nation to another, as they found churches to be built: their government was regular; and where they fixed near the building in hand, they made a camp of huts. A surveyor governed in chief; every tenth man was called a *warden*, and overlooked each nine. The gentlemen in the neighbourhood, either out of charity or commutation of penance, gave the materials and carriages. Those who have seen the accounts in records of the charge of the fabrics of some of our cathedrals near 400 years old, cannot but have a great esteem for their economy, and admire how soon they erected such lofty structures."

Mr. W. Preston, past-master of the Lodge of Antiquity, in a treatise on Masonry, published in 1792, tracing its origin from the creation, supposes its introduction into England to have been prior to the Roman invasion. Accordingly he appeals to those remains of stupendous works executed by the Britons, still existing, and which must have been executed at a much earlier period than the time of the Romans; and it is said, that the Druids had among them several customs similar to those of the masons, and that they derived their government from Pythagoras: but it is difficult to ascertain the resemblance for which the advocates of the early origin of the society of free-masons contend. Although masonry is said to have been encouraged by Cæsar, and by many Roman generals, who were governors in Britain, and the fraternity of masons was actually employed in the construction of many magnificent fabrics, we have no existing records of their lodges and conventions; and of the customs that prevailed in their assemblies the accounts transmitted to us are very imperfect. In the time of Carausius the art of masonry revived; and among other artificers, he collected a number of ingenious masons from many different countries, and appointed his steward Albanus as the superintendent of their assemblies. At this time, lodges, or conventions of the fraternity, began to be introduced. Albanus obtained from Carausius a charter to hold a general council, of which he was president, and in which many new members were admitted. This Albanus is said to have been the famous St. Alban, who suffered martyrdom in Britain for the Christian faith. In proof of this fact, Mr. Preston refers to some ancient manuscripts. By the departure of the Romans from Britain, the progress of masonry was checked, and it was afterwards wholly neglected. After the introduction of Christianity, however, masonry, together with other arts, revived, and lodges were formed; but being under the direction of foreigners, they gained no permanent reputation. After the year 557, when St.

Austin with his companions arrived in England, masonry was taken under his protection; and the Gothic style of building was introduced by those foreigners, who about this time resorted to the kingdom. Austin, it is said, distinguished himself by being the head of the fraternity, who founded the old cathedral of Canterbury in 600; that of Rochester in 602; St. Paul's in London in 604; St. Peter's in Westminster in 605; as well as many others. The number of masons in England was thus greatly increased, as well as by his other buildings of castles, &c. throughout the kingdom. In 640 some ingenious artists arrived from France, and formed themselves into a lodge under the direction of Bennet, abbot of Wirral, whom Kenred, king of Mercia, soon after appointed inspector of the lodges, and general superintendent of the masons. Masonry, however, during the heptarchy, was in a low state; but it began to revive under the patronage of St. Swithin, who was employed by Ethelwolf in repairing some religious houses; and from that time the art was gradually improved till the year 872, when it found a zealous protector in Alfred the Great, who appropriated a seventh part of his revenue in employing a number of workmen for rebuilding the cities, castles, &c. ruined by the Danes. During the reign of his successor Edward, the masons continued to hold their lodges under the sanction of Ethred, husband to the king's sister, and Ethelward his brother, to whose care the fraternity was intrusted. The true re-establishment of masonry in England, however, is dated from the reign of king Athelstan; and there is still existing an ancient lodge of masons in York, which traces its origin to this period. This lodge, said to be the most ancient in England, was founded in 926, under the patronage of Edwin, the king's brother, who obtained for it a charter from Athelstan, and became himself grand-master. By virtue of this charter all the masons in the kingdom were assembled, and in their assembly, as it is reported, they established a general or grand lodge for their future government. Under the patronage and jurisdiction of this lodge it is alleged, that the fraternity very considerably increased; and kings, princes, and other eminent persons, who had been initiated into the mysteries, paid due allegiance to the assembly.

On the decease of prince Edwin and king Athelstan, the masons were dispersed, and remained in an unsettled state till the reign of Edgar, in 960. They were then collected by St. Dunstan, and employed in works to which they had been accustomed; but for want of permanent encouragement, their lodges declined, and masonry remained in a low state for more than fifty years. It revived under Edward the Confessor, in 1041; and by the assistance of Leofrick, earl of Coventry, he rebuilt Westminster Abbey, the earl being superintendent of the masons. After the conquest, in 1066, Gundulph, bishop of Rochester, and Roger de Montgomey, earl of Shrewsbury, both of them excellent architects, became joint patrons of the masons; and under their auspices the Tower of London was begun, though finished only in the reign of William Rufus, who likewise rebuilt London bridge with wood, and in 1087 first constructed the palace and hall of Westminster. During the reigns of Henry I. and of Stephen, the masonic lodges assembled, and the society was employed in building a chapel at Westminster, near the House of Commons, and other works; the president of the lodges being Gilbert de Clare, the marquis of Pembroke. Under the reign of Henry II., the lodges were superintended by the grand-master of the Knights Templars, who employed them in building their temple in Fleet-street, in the year 1155. Masonry continued under the patronage of this or-

der till the year 1199, when John succeeded Richard I. in the throne of England, and Peter de Colechurch was then appointed grand-master. He began to rebuild London bridge with stone, which was afterwards finished by William Alcmayn, in 1209. Peter de Rupibus succeeded Peter de Colechurch in the office of grand-master, and Geoffrey Fitz-Peter, chief surveyor of the king's works, acted as deputy under him; masonry continued also to flourish under the auspices of these two artists during this and the following reign. On the accession of Edward I. in 1272, the superintendance of the masons was intrusted to Walter Giffard, archbishop of York, Gilbert de Clare, earl of Gloucester, and Ralph, lord of Mount Hermer, the progenitor of the family of the Montagues; and by these architects the abbey of Westminster was finished, after having been begun in 1220, during the minority of Henry II. During the reign of Edward II. the fraternity were employed in building Exeter and Oriel colleges in Oxford, Clare-hall in Cambridge, &c. under the auspices of Walter Stapleton, bishop of Exeter, who had been appointed grand-master of the masons in 1307.

In the reign of Edward III. the lodges under his patronage were numerous; and the fraternity held communications under the protection of the civil magistrates. William a Wykeham continued grand-master on the accession of Richard II., and by him both the New college in Oxford, and Winchester college, were founded at his own expence. After the accession of Henry IV., Thomas Fitz-Allan, earl of Surrey, was appointed grand-master, who, after the engagement at Shrewsbury, founded Battle-abbey and Fotheringay; the Guildhall at London being also built in this reign. On the accession of Henry V., the fraternity were directed by Henry Chichely, archbishop of Canterbury, under whom the lodges and communications of the fraternity were frequent. In 1425, however, during the reign of Henry VI. an act was made against the meetings of the chapters and congregations of masons, because it was said, that by such meetings "the good course and effect of the statutes of labourers were openly violated and broken, in subversion of the law, and to the great damage of all the commons." But this act was not put in force, nor did the fraternity cease to meet as usual under the protection of archbishop Chichely, who still continued to preside over them.

Notwithstanding a charge alleged at this time against the masons, the duke of Gloucester, protector and guardian of the kingdom, apprised of their innocence, took them under his protection, and transferred the charge of sedition against Henry, bishop of Winchester, and his followers. Although the duke was afterwards impeached, imprisoned, and murdered, the masons were not only permitted to meet without molestation, but were joined by the king himself. In that year (1442) he was initiated into masonry, and from that time was assiduous in making himself complete master of the art. He revised the constitutions of the body, and honoured them with his sanction; and his example was followed by many of the nobility. The king presided over the lodges in person, nominating William Wanefleet, bishop of Winchester, grand-master. The bishop, at his own expence, built Magdalen college, Oxford, and several religious houses. Eton college, near Windsor, and King's college, at Cambridge, were also founded during this reign. Henry himself founded Christ's college, Cambridge, as his queen, Margaret of Anjou, did Queen's college in the same university. About this time, the masons were protected and encouraged by James I. of Scotland, who honoured the lodges with his presence,

M A S O N S.

presence, and settled an annual revenue of four pounds Scots (an English noble) to be paid by every master-mason in Scotland, to a grand-master, chosen by the grand lodge, and approved of by the crown.

The flourishing state of masonry was interrupted by the civil wars between the houses of York and Lancaster, which brought it almost totally into neglect. About 1471, however, it revived under the auspices of Robert Beauchamp, bishop of Sarum, who had been appointed grand-master by Edward IV. and honoured with the title of *Chancellor of the Garter*, for repairing the castle and chapel of Windsor. It again declined during the reigns of Edward V. and Richard III.; but came once more into repute on the accession of Henry VII. in 1485. It was now patronised by the master and fellows of the order of St. John at Rhodes (now Malta); who assembled their grand lodge in 1500, and chose Henry for their protector. On the 24th of June, 1502, a lodge of masons was formed in the palace, at which the king presided as grand-master; and having appointed John Islip, abbot of Westminster, and sir Reginald Bray, knight of the Garter, his wardens for the occasion, proceeded in great state to the east end of Westminster Abbey, where he laid the first stone of that excellent piece of Gothic architecture, called Henry the Seventh's chapel. The cape-stone of this building was celebrated in 1507. The palace of Richmond, as well as many other noble structures, were raised under the direction of sir Reginald Bray; and the colleges of Brazen-Nose, in Oxford, and Jesus and St. John's in Cambridge, were all finished in this reign.

On the accession of Henry VIII. cardinal Wolsey was appointed grand-master; who built Hampton-court, Whitehall, Christ-church college, Oxford, with several other noble edifices; all of which, upon the disgrace of that prelate, were forfeited to the crown in 1530. Wolsey was succeeded as grand-master in 1534 by Thomas Cromwell, earl of Essex; who employed the fraternity in building St. James's palace, Christ's hospital, and Greenwich castle. Cromwell being beheaded in 1540, John Touchet, lord Audley, succeeded to the office of grand-master, and built Magdalen college, in Cambridge, and many other structures. In 1547, the duke of Somerset, guardian of the king, and regent of the kingdom, became superintendent of the masons, and built Somerset-house in the Strand; which, on his being beheaded, was forfeited to the crown in 1552.

After the death of the duke of Somerset, John Poynt, bishop of Winchester, presided over the lodges till the death of the king, in 1553. From this time they continued without any patron till the reign of Elizabeth, when sir Thomas Sackville accepted of the office of grand-master. Lodges, however, had been held during this period in different parts of England; but the general or grand lodge assembled in the city of York, where it is said the fraternity were numerous and respectable.—Of the queen we have the following curious anecdote with regard to the masons: hearing that they were in possession of many secrets, which they refused to disclose, and being naturally jealous of all secret assemblies, she sent an armed force to York, to break up their annual grand-lodge. The queen, however, being afterwards thoroughly convinced that the fraternity of masons did not interfere in state affairs, became quite reconciled to their assemblies, and from this time masonry made a considerable progress; lodges were held in different parts of the kingdom, particularly in London and its neighbourhood, where the number of the brethren increased considerably. Several great works were carried on there under the auspices of sir Thomas

Gresham, from whom the fraternity received every encouragement.

Sir Thomas was succeeded in the office of grand-master by Charles Howard, earl of Effingham, who continued to preside over the lodges in the south till the year 1588, when George Hastings, earl of Huntingdon, was chosen grand-master, and remained in the office till the decease of the queen in 1603.

On the accession of James I. to the crown of England, masonry flourished, and lodges were held, in both kingdoms. A number of gentlemen returned from their travels, with curious drawings of the old Greek and Roman architecture, as well as strong inclination to revive a knowledge of it. Among these was the celebrated Inigo Jones, who was appointed general surveyor to the king. He was named grand-master of England, and was deputed by the king to preside over the lodges. Several learned men were now initiated into the mysteries of masonry, and the society increased considerably in reputation and consequence. Ingenious artists resorted to England in great numbers; lodges were constituted as seminaries of instruction in the sciences and polite arts, after the model of the Italian schools; the communications of the fraternity were established, and the annual festivals regularly observed. Under the direction of this accomplished architect, many magnificent structures were raised; and among the rest, he was employed, by command of the sovereign, to plan a new palace at Whitehall, worthy of the residence of the kings of England. This was executed; but for want of a parliamentary fund, no more of the plan was ever finished than the banqueting-house. Inigo Jones continued in the office of grand-master till the year 1618, when he was succeeded by the earl of Pembroke; under whose auspices many eminent and wealthy men were initiated, and the mysteries of the order held in high estimation.

After Charles I. ascended the throne, earl Pembroke was continued in his office till the year 1630, when he resigned in favour of Henry Danvers, earl of Danby. This nobleman was succeeded, in 1633, by Thomas Howard, earl of Arundel, the ancestor of the Norfolk family. In 1635, Francis Russell, earl of Bedford, accepted the government of the society; but Inigo Jones having continued to patronize the lodges during his lordship's administration, he was re-elected the following year, and continued in office till the year of his death, 1646. The progress of masonry, however, was for some time obstructed by the breaking out of the civil wars; but it began to survive under the patronage of Charles II., who had been received into the order during his exile. Some lodges during this reign were constituted by leave of the several noble grand-masters, and many gentlemen and famous scholars requested at that time to be admitted into the fraternity. On the 27th of December, 1663, a general assembly was held, where Henry Jennyn, earl of St. Alban's, was elected grand-master; who appointed sir John Denham his deputy, and Mr. Christopher Wren, afterwards the celebrated sir Christopher Wren, and John Webb, his wardens. At this assembly several useful regulations were made, for the better government of the lodges; and the greatest harmony prevailed among the whole fraternity. The earl of St. Alban's was succeeded in his office of grand-master by earl Rivers, in the year 1666, when sir Christopher Wren was appointed deputy, and distinguished himself beyond any of his predecessors in promoting the prosperity of the lodges which remained at that time, particularly that of St. Paul's, now the Lodge of Antiquity, which he patronized upwards of eighteen years. At this time he attended

M A S O N S.

attended the meetings regularly; and during his presidency made a present to the lodge of three mahogany candlesticks, which at that time were very valuable. They are still preserved, and highly valued as a testimony of the esteem of the donor.

Whilst the city, after its destruction by fire in 1666, was in building, lodges were held by the fraternity in different places, and many new ones constituted, to which the best architects resorted. In 1674, earl Rivers resigned the office of grand-master in favour of George Villiers, duke of Buckingham, who left the care of the fraternity to his wardens, and sir Christopher Wren, who still continued to act as deputy. In 1679, the duke resigned in favour of Henry Bennet, earl of Arlington: but this nobleman was too deeply engaged in state-affairs to attend to his duty as a mason, though the lodges continued to meet under his sanction, and many respectable gentlemen joined the fraternity. During the short reign of James II. the masons were much neglected. In 1685, sir Christopher Wren was elected to the office of grand-master, who appointed Gabriel Cibber and Mr. Edward Strong his wardens: yet notwithstanding the great reputation and abilities of this celebrated architect, masonry continued in a declining way for many years, and only a few lodges were held occasionally in different parts of the kingdom.

At the Revolution, the society was in such a low state in the south of England, that only seven regular lodges were held in London and its suburbs; and of these only two, *viz.* that of St. Paul's and one at St. Thomas's hospital, Southwark, were of any consequence. But in 1695, king William, having been initiated into the mysteries, honoured the lodges with his presence, particularly one at Hampton-court, at which he is said to have frequently presided during the time that the new part of his palace was building. Many of the nobility also were present at a general assembly and feast held in 1697; particularly Charles, duke of Richmond and Lennox, who was elected grand-master for that year; but in 1698, resigned his office to sir Christopher Wren, who continued at the head of the fraternity till king William's death in 1702.

During the reign of queen Anne, masonry made no considerable progress. Sir Christopher's age and infirmities drew off his attention from the duties of his office, the annual festivals were entirely neglected, and the number of masons considerably diminished. It was therefore determined that the privileges of masonry should not be confined to operative masons, but that people of all professions should be admitted to participate in them, provided they were regularly approved and initiated into the order.

Thus the society once more rose into esteem; and on the accession of George I. the masons, now deprived of sir Christopher Wren, resolved to unite again under a grand-master, and revive the annual festival. With this view, the members of the only four lodges at that time existing in London, met at the Apple-tree tavern in Charles-street, Covent-Garden; and having voted the oldest master-mason then present into the chair, constituted themselves a grand lodge *pro tempore*. It was now resolved to renew the quarterly communications among the brethren; and at an annual meeting held on the 24th of June the same year, Mr. Anthony Sayer was elected grand-master, invested by the oldest master-mason there present, intailed by the master of the oldest lodge, and had due homage paid him by the fraternity. Before this time a sufficient number of masons, met together within a certain district, had ample power to make masons without a warrant of constitution; but it was now determined, that

the privilege of assembling as masons should be vested in certain lodges or assemblies of masons convened in certain places, and that every lodge to be afterwards convened, excepting the four old lodges then existing, should be authorized to act by a warrant from the grand-master for the time, granted by petition from certain individuals, with the consent and approbation of the grand lodge in communication; and that without such warrant, no lodge should hereafter be deemed regular or constitutional. The former privileges, however, were still allowed to remain to the four old lodges then extant. In consequence of this, the old masons in the metropolis vested all their inherent privileges, as individuals, in the four old lodges, in trust that they never would suffer the ancient charges and land-marks to be infringed. The four old lodges, on their part, agreed to extend their patronage to every new lodge which should hereafter be constituted according to the new regulations of the society; and while they acted in conformity to the ancient constitutions of the order, to admit their masters and wardens to share with them all the privileges of the grand lodge, that of precedence only excepted.

Matters being thus settled, the brethren of the four old lodges considered their attendance on the future communications of the society as unnecessary; and therefore trusted implicitly to their masters and wardens, satisfied that no measure of importance would be adopted without their approbation. It was, however, soon discovered, that the new lodges being equally represented with the old ones at the communications, would at length so far outnumber them, that by a majority they might subvert the privileges of the original masons of England, which had been centered in the four old lodges; on which account a code of laws was, with the consent of the brethren at large, drawn up for the future government of the society. To this the following was annexed, binding the grand-master for the time being, his successors, and the master of every lodge to be hereafter constituted, to preserve it inviolably; "Every annual grand lodge has an inherent power and authority to make new regulations, or to alter these for the real benefit of this ancient fraternity, provided always that the old land-marks be carefully preserved: and that such alterations and new regulations be proposed and agreed to at the third quarterly communication preceding the annual grand feast; and that they be offered also to the perusal of all the brethren before dinner, in writing, even of the youngest apprentice; the approbation and consent of the majority of all the brethren present being absolutely necessary to make the same binding and obligatory." To commemorate this circumstance, it has been customary, ever since that time, for the master of the oldest lodge to attend every grand installation; and, taking precedence of all present, the grand-master only excepted, to deliver the book of the original constitutions to the new installed grand-master, on his promising obedience to the ancient charges and general regulations.

By this precaution, the original constitutions were established as the basis of all succeeding masonic jurisdiction in the south of England; and the ancient land-marks, as they are called, or the boundaries set up as checks against innovation, were carefully secured from the attacks of any future invaders.

In 1720 the fraternity sustained an irreparable loss by the burning of several valuable manuscripts, concerning the lodges, regulations, charges, secrets, &c. (particularly one written by Mr. Nicholas Stone, the warden under Inigo Jones.) This was done by some scrupulous brethren, who were alarmed at the publication of the masonic constitutions. At a quarterly communication it was this year agreed, that,

for

M A S O N S.

for the future, the new grand-master shall be named and proposed to the grand lodge some time before the feast: and if approved and present, he shall be saluted as grand-master elect: and that every grand-master, when he is installed, shall have the sole power of appointing his deputy and wardens, according to ancient custom.

In the mean time, masonry continued to spread in the north as well as the south of England. The general assembly, or grand lodge at York, continued to meet as usual. Several lodges met in 1705, under the direction of sir John Tempest, bart. then grand-master: and many persons of worth and character were initiated into the mysteries of the fraternity. The greatest harmony subsisted between the two grand lodges, and private lodges were formed in both parts of the kingdom, under their separate jurisdiction. The only distinction which the grand lodge in the north appears to have retained is in the title of the *Grand Lodge of all England*; while the other was only called the *Grand Lodge of England*. The latter, however, being encouraged by some of the principal nobility, soon acquired consequence and reputation, while the other seemed gradually to decline: but, till within these few years; the authority of the grand lodge at York was never challenged: on the other hand, every mason in the kingdom held that assembly in the highest veneration, and considered himself bound by the charges which originated from that assembly. It was the glory and boast of the brethren in almost every country where masonry was established, to be accounted descendants of the original York masons; and from the universality of the idea that masonry was first established at York by charter, the masons of England have received tribute from the first states in Europe. At present, however, this social intercourse is abolished, and the lodges in the north and south are almost entirely unknown to one another; and neither the lodges of Scotland nor Ireland court the correspondence of the grand lodge at London. This is said to have been owing to the introduction of some innovations among the lodges in the south; but for the coolness which subsists between the two grand lodges, another reason is assigned. A few brethren at York having, on some trivial occasion, seceded from their ancient lodge, they applied to London for a warrant of constitution. Their application was honoured without any inquiry into the merits of the case; and thus, instead of being recommended to the mother lodge to be restored to favour, these brethren were encouraged to revolt, and permitted, under the sanction of the grand lodge in London, to open a new lodge in the city of York itself. This illegal extension of power justly offended the grand lodge at York, and occasioned a breach which has never yet been made up.

The duke of Buccleugh, who in 1723 succeeded the duke of Wharton as grand-master, first proposed the scheme of raising a general fund for distressed masons. The duke's motion was supported by lord Paisley, colonel Houghton, and a few other brethren; and the grand lodge appointed a committee to consider of the most effectual means of carrying the scheme into execution. The disposal of the charity was first vested in seven brethren; but this number being found too small, nine more were added. It was afterwards resolved that twelve masters of contributing lodges, in rotation with the grand officers, should form the committee; and by another regulation since made, it has been determined that all past and present grand officers, with the masters of all regular lodges which shall have contributed within twelve months to the charity, shall be members of the committee. This committee meets four times in the year by virtue of a summons from the grand-master or his deputy. The petitions of

the distressed brethren are considered at these meetings; and if the petitioner be considered as a deserving object, he is immediately relieved with five pounds. If the circumstances of the case are of a peculiar nature, his petition is referred to the next communication, where he is relieved with any sum the committee may have specified, not exceeding twenty guineas at one time. Thus the distressed have always found ready relief from this general charity, which is supported by the voluntary contributions of different lodges out of their private funds, without being burdensome to any member in the society. Thus has the committee of charity for freemasons been established; and so liberal have the contributions been, that though the sums annually expended for the relief of the distressed brethren have for several years past amounted to many thousand pounds, there still remains a considerable surplus.

What the end of the institution of masonry is, seems still, in some measure, a secret; though so much of it as is known appears laudable enough, as it tends to promote friendship, society, mutual assistance, and good fellowship.

The members of this society, among whom we may reckon a great number of illustrious persons in various parts of the world, allege, that in the admission of members, and the management of its concerns, a particular regard is paid to the principles of religion and morality; they say also, that in proportion as masonry has prevailed, societies and even nations have been civilized. However this be, it is certain, that its signs serve as a kind of universal language, so that by means of them people of the most distant nations may become acquainted, and enter into friendship with one another. This must be allowed to be a circumstance of no small importance and utility, to those who traverse distant regions, and wish to find associates and friends even among strangers.

The brothers of this family are said to be possessed of a great number of secrets, which have been religiously observed from age to age.

The uninitiated, however, ridicule the notion that masons possess any peculiar secrets, apprehending, that in some unguarded and convivial moment or other, they would be divulged; and that it would be dangerous to repose confidence in the number, as well as in the various dispositions, of those who are admitted into the society. Secrecy and silence are undoubtedly on many occasions desirable and laudable attainments; and we find that among many of the philosophers of antiquity, they were strictly enjoined and sedulously cultivated. If the laws, charges, and regulations of the free and accepted masons, as they are detailed in a work, entitled "The Constitution of Free-Masonry, &c." by the late Laurence Dermott, esq., and revised and corrected with considerable additions by Thomas Harper, D. G. M. 1807, are faithfully recorded, which we have no reason to question, they are not only irreproachable, but deserving of commendation.

The abbé Barruel, however, who in his "Memoirs illustrating the History of Jacobinism," translated into English by the Hon. Robert Clifford, F.R.S. and A.S., and published in 1798, ascribes the French revolution, and the subsequent convulsions on the continent of Europe, to the principles and operations of the freemasons, pronounces a panegyric on the English masons, and represents them as distinguished from the others by ties which only appear to unite them more closely in the bonds of charity and fraternal affection. At the time, he says, when the Illuminées of Germany, the most detestable of the Jacobin crew, were seeking to strengthen their party by that of masonry, they affected a contempt for the English lodges.

This

This zealous writer also allows, that for a considerable length of time the generality of lodges both in France and Germany, might have been excepted from the charge which he adduces against the objects of his censure and condemnation. "The grand objects of the masonry, which he criminales, were equality and liberty. The very name of free-mason carries with it the idea of liberty; and as to *equality*, it was disguised under the name of *fraternity*, which has nearly a similar signification. The author seems to have been enrolled as a member of this society against his own inclination; and he describes the manner in which he was admitted to the several degrees of "apprentice," "fellow-craft," and "master," in one evening. The grand object which he proposed to himself was to learn the famous secret of masonry. When the moment arrived that was destined for this purpose, he was ordered to approach nearer to the Venerable. Then the brethren who had been armed with swords for the occasion, drawing up in two lines, held their swords elevated, leaning the points toward each other, and formed what in masonry is called the *arch of steel*. The candidate passes under this arch to a sort of altar elevated on two steps, at the farthest end of the lodge. The master, seated in an arm chair, or a sort of throne, behind this altar, pronounced a long discourse on the inviolability of the secret which was to be imparted, and on the danger of breaking the oath which the candidate was going to take. He pointed to the naked swords which were always ready to pierce the breast of the traitor, and declared to him that it was impossible to escape their vengeance. The candidate then swears, that rather than betray the secret, he consents to have his head cut off, his heart and entrails torn out, and his ashes cast before the winds. Having taken the oath, the master said the following words to him, which the reader (as he says) may easily conceive have not escaped my memory, as I had expected them with so much impatience, "My dear brother, the secret of masonry consists in these words, *Equality and Liberty; all men are equal and free; all men are brethren.*" The master did not utter another syllable, and every body embraced the new *brother equal and free*. The lodge broke up, and we gaily adjourned to a masonic repast.

Under the designation of occult lodges, or the higher degrees of masonry, our author comprehends all free-masons in general, who, after having passed the first three degrees of apprentice, fellow-craft, and master, are sufficiently zealous to be admitted into the higher degrees, where, as he says, the veil is rent asunder, where emblematical and allegorical figures are thrown aside, and where the twofold principle of equality and liberty is unequivocally explained "by war against Christ and his altars, war against kings and their thrones!!!" That such is the result of the grand mysteries of the craft is what he undertakes to demonstrate; and we refer those who are desirous of knowing or examining his proofs to his own statement of them.

Masonic writers in general, says M. Barruel, divide free-masonry into three classes, the Hermetic, the Cabalistic, (comprehending the Martinists,) and the Eclectic masonry; all of which agree in one point, *viz.* their hatred to Christianity and revelation. The Hermetic masonry, or the Scotch degrees, who work in chemistry, have adopted Pantheism or the true Spinozism. With those who belong to this class "every thing is God, and God is every thing." This is their grand mystery, engraved in one word "Jehovah," on the stone brought by the Knights-Templars from the Holy Land. The Cabalistic masonry was found in the Prussian lodges of the Rosicrucians, at least before their union with the Illuminés; and it was adopted, we are told, by certain lodges of Rosicrucians in France, a few years

before the revolution, and particularly at Bourdeaux. The Jehovah of this sect is no longer the God *whole*; but he is at once the God "Sifamoro," and the God "Senamira." The first is joined by the genius "Sallak," and the second by the genius "Sokak." If these famous Cabalistic words are inverted, we have "Oromafis," or the God *good*, and "Arimanes," the God *evil*, and the geni will become "Kallas" and "Kakos," good and bad. Thus in attributing to Oromafis a multitude of good geni or spirits like himself, and to Arimanes evil geni participating of his own wickedness, we have the "Jehovah" of Cabalistic masonry; that is, the *word* to be recovered in their lodges, or the tenets to be substituted to those of Christianity. According to the Martinist system, the God *good*, the God *evil*, and every thinking being, or, in other words, God, man, and the devil, are of the same nature, the same essence, and the same species. The enlightened Martinist erases the pains of hell from his moral code, and the tendency of his political system is to reduce all society, all legitimate authority, to that of a father governing his children; to overturn every throne, and annihilate every law but that of the ancient patriarchs. This sect is said to have made great progress in France and Germany, and to have even reached England; and every where their grand object is to represent the French revolution as the fire which is to purify the world.

The Eclectic masons are represented as much more numerous than the Martinist masons. These, after having passed through the different degrees of masonry, attach themselves to no particular system, either political or religious, into which they have been initiated, but adopt from them whatever may best suit their political or religious views. They are what they please, Deists, Atheists, Sceptics, an aggregate of all the errors of the philosophism of the day: with respect to religion, they admit that equality and liberty which deny every authority but their own reason, and reject all revealed religion; and as to governments, they admit of no kings, unless subservient to the will of the people in right of its sovereignty. Those who belong to a sort of Eclectic masonry, lately established in Germany, assert that all are independent, and have a right of making their own laws. For this reason, they have abolished the names of Grand Lodge and Scotch Lodge, so that they may be said to have improved upon masonic equality and liberty. Such Eclectic masons could not have been very numerous in France, as the major part of them was under the inspection of the Grand Parisian Lodge, called the "Grand Orient." The sentiment introduced into all the Eclectic lodges, is that of hating Christ and his religion, and detesting all sovereignty and legislative power, except that of the people. All classes, and every code of masonry, Hermetic, Cabalistic or Martinists, and Eclectic, have concurred in forwarding the revolution; and it little imported to the sect which struck the blow, provided that ruin ensued.

In tracing the origin of free-masonry, M. Barruel rejects the opinion of those who ascribe it to the Persian, Egyptian, Grecian, Roman, or Druid sages; but he attributes its commencement to the Knights Templars, who were either the authors of it, or borrowed it by tradition from the ancient mysteries of Paganism, and of its sages. According to our author's statement, the depositions of the Knights Templars declare, that on their reception into the order they denied Christ, trampled on the cross, and spit upon it; that Good Friday was a day particularly consecrated to such outrages; that they promised to prostitute themselves to each other for the most unnatural crimes; that every child begotten by a Templar was cast into the fire; that they bound themselves by oath to obey, without exception, every order from the grand-

master, to spare neither sacred nor profane; to look upon every thing as lawful when the good of the order was in question; and, above all, never to violate the horrible secrets of their nocturnal mysteries, under pain of the most terrible chastisements. After having traced, in various particulars, the resemblance of the free-masons to these ancient knights, our author, as if he did not think this parentage sufficiently disgraceful, traces them farther back by several centuries to Manes and the Manichees; adopting several unfounded opinions, reflecting on the Albigenses, Waldenses, &c. in the south of France. It would lead us far beyond our limits to pursue our author's declamatory reasoning, and to detail those points of resemblance which he discovers between the free-masons of the continent and those ancient heretics. If the reader has curiosity, he may consult Barruel himself.

Our author closes his account of the free-masons, as to their origin, principles, and practices, with diverting the attention of his reader to a body of men, or rather, as he calls them, a band of conspirators, who had coalesced, under the name of "Illuminées," with the Encyclopédistes and masons, far more dangerous in their tenets, more artful in their plots, and more extensive in their plans of devastation. They more silently prepared the explosions of the revolutionary volcano, not merely swearing hatred to the altar of Christ and the throne of kings, but swearing at once hatred to every god, to every law, to every government, to all society and social compact; and in order to destroy every plea, and every foundation of the social contract, they proscribed the terms *mine* and *thine*, acknowledging neither equality nor liberty, but in the "entire, absolute, and universal overthrow of all property whatever."

MASON, in *Geography*, a county of Kentucky, on the S. side of Ohio river, watered by a number of creeks, which fall into Sandy river and the Ohio, and containing 11,405 inhabitants, of whom 1603 are slaves.—Also, a township in Hillsborough county, New Hampshire, on the Massachusetts line, about 70 miles W. of Portsmouth, and 50 N.W. of Boston, containing 1179 inhabitants.

MASON'S *Island*, a small island in the Patowmac. N. lat. 39°. W. long. 77° 13'.

MASONRY is the art of preparing and combining stones, so as to tooth or indent them into each other, and form regular surfaces, either for shelter, convenience, or defence; as the habitations of men, animals, the protection and shelter of goods, &c.

The tools employed by the mason are different in different countries, according to the quality of the stone.

In London, the value of stone occasions it to be cut into scantlings by a saw, and the operation is done by the labourer: in different parts of the country where stone abounds, it is divided into smaller scantlings by means of wedges. Hard stone and marble are reduced to a surface by a mallet and chisel.

The principal implements used in London for hewing stones are the mallet and tools. The form of masons' tools, which are used by the percussive blows of the mallet, is that of a wedge; the cutting edge is the vertical angle. The material out of which such tools are made is iron, except the end which enters the stone, which is of steel. The end of the tool which is struck by the mallet is a small portion of a spheric surface, and projects on all sides beyond the adjoining part or hand hold, which increases in magnitude towards the middle of the tool, and thence tapers forward, in the form of a wedge or pyramid, to the entering or cutting edge. The other tools used by the mason are, a level, a plumb rule, a square, a bevel, and rules both straight and circular, of

various descriptions, for trying the surfaces in the progressive state of the work.

The tools used in London, in succession, to work the face of a stone, are, the point, the inch tool, the boaster, then the broad tool. The operation of working with the point is called *pointing*, and that with the boaster is called *boasting*. The operation of the point leaves the surface in narrow furrows, with rough ridges between them. The inch tool is used in cutting away the ridges, and the boaster in making the surface of the work nearly smooth. The point is in breadth, at the entering part, from $\frac{1}{4}$ th to $\frac{3}{8}$ ths of an inch, the boaster 2 inches wide, and the broad tool $3\frac{1}{2}$ inches at the cutting edge. In the use of the tool, the cutting edge is always perpendicular to the same side of the stone. There are two kinds of operations performed by it: suppose the impression made by the whole breadth of the tool, at the cutting edge, to be called a cavity. In one operation, the successive cavities follow one another in the same straight line, until the breadth or length of the stone is exhausted; then successive equidistant parallel lines are repeated in the same manner, until the whole surface of the stone has been gone over by the tool. This manner of hewing is called *stroking*, which is a kind of fluted surface. In the other operation, every successive cavity is repeated in new equidistant lines throughout the length or breadth of the stone, then a new series of cavities is again repeated throughout the length or breadth of the stone, and thus until the whole breadth or length of the stone is exhausted. This mode is called *tooling*.

Tools for working cylindrical and conical parts of mouldings are of all sizes, from $\frac{1}{4}$ th part of an inch upwards; but those for working convex mouldings are generally half an inch broad, unless in confined spaces, where such breadth cannot be admitted.

A stone is taken, for the greater part, out of winding with points, and entirely with the inch tool.

In London, the facings of buildings made with squared stone, are either stroked, tooled, or rubbed.

In the country, where the saving of stone by the use of the saw is not a compensation for the loss of time taken up in sawing, the operation is entirely performed by the mallet and chisel.

When stones are very unshapely previous to the operation of hewing, a stone ax, jedding ax, scabbling hammer, or cavi, is used in order to bring the stone nearly to a shape: one end of the jedding ax is flat, and is used for knocking off the very protuberant angular parts when less than right angles, the other end is pointed for reducing the different surfaces nearly to the intended form.

In some parts of the country, different fancies of hewn surfaces are indulged, as herring-bone work: this is forming the surfaces of the stones by zig-zag lines parallel to each other.

In Scotland, besides what has already been noticed in hewn work, are other kinds denominated droved, broached, and striped. Droving is the same as that called random tooling in England, or boasting in London; and the chisel for broaching is called a punch, and is the same as that called a point in England. Broached work is first droved and then broached, as the work cannot be done regularly at once with the punch. Striped work must also be first droved and then striped. Hence, of these three kinds of surfaces, the droved is the cheapest. Though broaching is sometimes performed without droving, it is never so regular; and besides, the surface is generally full of inequalities. It must be observed, however, that workmen in general do not take the same pains to drove the face of a stone which is to be afterwards broached, as in that of which the droving is to remain the

final finish: these should be noticed by the superintendent. Doving, broaching, and striping, are the terms used in Edinburgh and Glasgow, and in the south of Scotland. In Aberdeen, where the stone is very hard, being a kind of granite, the same operations cannot be employed. Instead of them they use a scabbling hammer, by which they pick the stone until the surface has nearly acquired its intended form. This manner of dressing the surface for the stone facing of a building is called *nidged work*, and the operation *nidging*. The term rubbed work is applied where the surface is smoothed by means of sand or grit stone.

Various curved rules, or templets and gauges, are also employed in hewn work. The tools used in setting or building are, a line and line pins, the level, the plumb rule, and rules of various descriptions, as also templets for circular work.

Marbles are polished by first being rubbed with grit-stone, then with pumice-stone, and lastly with emery or calcined tin.

The chief stone used in London is Portland, which comes from the island of Portland in Dorsetshire. It is used for public edifices, not only in ornaments, mouldings, and strings, but in all the exterior parts. In private buildings, where brick-work predominates, it is used in strings, window sills, balusters, steps, copings, &c. It must be observed, however, that under a great pressure it is apt to splinter or flush at the joints, and for this reason the joints cannot be made so close as many other kinds of stone will admit of. When it is recently quarried it is soft, and works easily, but acquires great hardness in length of time. The cathedral of St. Paul, Westminster bridge, and almost every public edifice in London, are constructed wholly, or in part, of Portland stone.

Purbeck stone comes from the island of Purbeck, in Dorsetshire also. It is mostly employed in rough work, as steps and paving.

Yorkshire stone is used where strength and durability are requisite, as in paving and coping.

Ryegate stone is used for hearths, slabs, and copings.

In Edinburgh a very fine stone called Craigleith, brought from a village of the same name in the neighbourhood of this city, is that most commonly used in the construction of their edifices. They have also very good stone from the Hails quarry, but rather inferior in point of colour.

This Craigleith quarry produces two kinds of rock, one of a fine cream or buff colour, called the liver rock, which is almost unchangeable, even though exposed in a building to the weather.

The city of Glasgow is built of various kinds of stone, the best of which are, the Possel and the Lord President's quarry: most other kinds are not only perishable, but liable to change their colour.

In the north of England, stone fit for hewn work is chiefly of a reddish colour. There is a very good white stone, however, in the vicinity of Liverpool, of which several of the public buildings are constructed.

All the stone fit to be squared, or squared and rubbed smooth, for the use of building, is mostly composed of sand. The stone used for the same purpose in the south of England is, in some parts, entirely chalk, and in other parts limestone. The Bath and Oxfordshire stone has so little grit in its texture, as to be wrought into mouldings with planes, as in joinery, and the surfaces are finished with an instrument called a *drag*.

Marbles, with regard to their contexture and variegation of colour, are almost of infinite variety: some are black, some white, some of a dove colour, and others beautifully variegated with every kind of rich colour. The best kind of white marble is that called statuary, and when cut into

thin slices becomes almost transparent, which property the others do not possess. The texture of marble, with regard to working, is not generally understood even by the best workmen, though upon sight they frequently know whether it will receive a polish or not. Some marbles are easily wrought, some are very hard, and other kinds resist the tools altogether.

Mortar is another principal material used in cementing the stones of a building. The reader who wishes to obtain a full knowledge in this department of masonry, may consult the article CEMENT, where he will receive satisfactory information.

Wherever it is intended to build upon, the ground must be tried with an iron crow or with a rammer: if found to shake it must be pierced with a borer, such as is used by well diggers; and if the ground proves to be generally firm, the loose or soft parts, if not very deep, must be excavated until a solid bed appears.

If the ground proves soft in several places to a great depth under apertures, and firm upon the scite of the piers, turn inverted arches under the apertures, so that if the foundation sink, the arches will resist the re-action of the ground, then the whole wall will sink uniformly or descend in one body. Should the ground be even of a uniform texture, it is always eligible to turn inverted arches under apertures, wherever there is a part of a wall carried up from the foundation to the fill of that aperture: it is from neglecting this circumstance that the sills of windows in the ground stories of buildings are frequently broken; indeed it is seldom or never otherwise.

Arches adequate to this purpose should rather be of a parabolic form than circular, the figure of the parabola being better adapted to preserve an equilibrium than the arc of a circle, which is of uniform curvature. If unfortunately the soft parts of the ground prove to be the scite of the piers, and, consequently, the hard places under the apertures, build piers under the apertures, and suspend arches between the piers with their concave side towards the trench as usual.

For more information upon this subject, the reader will refer to the article FOUNDATION.

In walling, the bedding joints have most commonly a horizontal position in the face of the work, and this disposition ought always to take place when the top of the wall terminates in an horizontal plane or line. In bridge building, and in the masonry of fence walls upon inclined surfaces, the bedding joints on the face sometimes follow the upper surface of the wall or terminating line.

The footings of stone walls ought to be constructed of large stones, which, if not naturally nearly square, should be reduced by the hammer to that form, and to an equal thickness in the same course; for if the beds of the stones in the foundation taper, the superstructure will be apt to give way, by resting upon mere angles or points with inclined beds instead of horizontal. All the vertical joints of any upper course should break joint, that is, they should fall upon the solid part of the stones in the lower course, and not upon the joints.

When the walls of the superstructure are thin, the stones which compose the foundation may be so disposed that their length may reach across each course, from one side of the wall to the other. In thicker walls, where the difficulty is greater in procuring stones of sufficient length to reach across the foundation, every second stone in the course may be a whole stone in the breadth, and each interval may consist of two stones of equal breadth, that is, placing header and stretcher alternately. But when those stones cannot be had

MASONRY.

conveniently, from one side of the wall lay a header and stretcher alternately, and from the other side lay another series of stones in the same manner, so that the length of each header may be two-thirds, and the breadth of each stretcher one-third of the breadth of the wall, and so that the back of each header may come in contact with the back of an opposite stretcher, and the side of that header to come in contact with the side of the header adjoining the said stretcher. In broad foundations, where stones cannot be procured for a length equal to two-thirds of the breadth of the foundation, build the work so that the upright joints of any course may fall on the middle of the length of the stones in the course below, and so that the backs of each stone in any course may fall upon the solid of a stone or stones in the course below.

The foundation should consist of several courses, of which each superior course should be of less breadth than the inferior one, say four inches on each side in ordinary cases, and the upper course project four inches on each side of the wall. The number of courses must be regulated by the weight of the wall, and by the size of the stones of which the foundation consists.

A wall which is built of unhewn stone is called a *rubble* wall, whether with or without mortar. Rubble work is of two kinds, coursed and uncoursed. Coursed rubble is that of which the stones are gauged and dressed by the hammer, and thrown into different heaps, each heap containing stones of the same thickness; then the masonry is laid in courses or horizontal rows, which may be of different thicknesses. The uncoursed rubble is that where the stones are laid promiscuously in the wall, without any attention to placing them in rows. The only preparation which the stones undergo, is that of knocking off the sharp angles with the thick end of the scabbling hammer.

Walls are most commonly built with an ashler facing and backed with brick or rubble work. Brick backings are common in London where brick is cheaper, and stone backing in the north of England and in Scotland where stone is cheaper. Walls faced with ashler, and backed with brick or uncoursed rubble, are liable to become convex on the outside from the greater number of joints, and from the greater quantity of mortar placed in each joint, as the shrinking of the mortar will be in proportion to the quantity, and therefore a wall of this description is much inferior to one of which the facing and backing are of the same kind, and built with equal care, even though both sides were uncoursed rubble, which is the worst of all walling. Where the outside of a wall is an ashler facing and the inside coursed rubble, the courses of the backing should be as high as possible, and set with thin beds of mortar. In Scotland, where stone abounds, and where perhaps as good ashler facings are constructed as any in Great Britain, the backing of their walls most commonly consists of uncoursed rubble, built with very little care. In the north of England, where the ashler facings of walls are done with less neatness, they are much more particular in coursing of their backings. Coursed rubble and brick backings are favourable for the insertion of bond timbers: but in good masonry wooden bonds should never be in continued lengths, as in case of fire or rot the wood will perish, and the masonry, being reduced by the breadth of the timber, will be liable to bend at the place where it was inserted. When it is necessary to have wall timber for the fastening of battens for lath and plaster, the pieces of timber ought to be built with the fibres of the wood perpendicular to the surface of the wall, or otherwise in unconnected short pieces not exceeding nine inches in length.

In an ashler facing the stones generally run from twenty-eight to thirty inches in length, twelve inches in height, and eight or nine inches in thickness. Although both the upper and lower beds of an ashler, as well as the vertical joints, should be at right angles to the face of the stone, and the face bed and vertical joints at right angles to the beds in an ashler facing, where the stones run nearly of the same thickness, it is of some advantage, in respect of bond, that the back of the stone be inclined to the face, and that all the backs thus inclined should run in the same direction, as this gives a small degree of lap in the setting of the next course; whereas if the backs were parallel to the front, there could be no lap where the stones run of an equal depth in the thickness of the wall. It is of some advantage likewise to select the stones, so that a thicker one and a thinner one may follow each other alternately. The disposition of the stones in the next superior course, should follow the same order as in the inferior course, and every vertical joint should fall as nearly as possible in the middle of the stone below.

In every course of ashler facing, with brick or rubble backing, *through* stones (as they are technically termed) should be introduced, and their number should be proportioned to the length of the course, and every such stone of a superior course should fall in the middle of every two like stones in the course below: this disposition of bonds should be strictly attended to in all long courses. Some wallers, in order to shew or demonstrate that they have introduced sufficient bonds in their work, choose their bond stones of greater length than the thickness of the wall, and knock or cut off their ends afterwards. This method is far from being eligible, as the wall is not only liable to be shaken by the force applied to break the end of the stone, but the stone itself is apt to be split.

In every pier where the jambs are coursed with the ashler in front, every alternate jamb stone ought to go through the wall with its beds perfectly level. If the jamb stones are of one entire height, as is frequently the case when architraves are wrought upon them, and upon the lenthil crowning them, in the stones at the ends of the courses of the pier which are to adjoin the architrave jamb, every alternate stone ought to be a through stone; and if the piers between the apertures be very narrow, no other bond stones will be necessary in such short courses. But where the piers are wide, the number of bond stones must be proportioned to the space: through stones must be particularly attended to in the long courses below and above windows.

Bond stones should have their sides parallel and of course perpendicular to each other, and their horizontal dimension in the face of the work should never be less than the vertical one. All the vertical joints, after receding about three quarters of an inch from the face with a close joint, should widen gradually to the back, and thereby form hollow wedge-like figures for the reception of mortar and packing. The adjoining stones should have their beds and vertical joints filled with oil putty from the face to about three quarters of an inch inwards, and the remaining part, of the beds with well prepared mortar. Putty cement will stand longer than moist stones, and will even remain prominent, when the stone itself is in a state of dilapidation, by the influence of the corroding power of the atmosphere. It is true that in all newly built walls cemented with oil putty, the first appearance of the ashler work is rather unsightly, owing to the oil of the putty disseminating itself into the adjoining stones, which makes the joints appear dirty and irregular: but this disagreeable effect is removed in a year, or less; and if care has been taken to make the colour of the putty suitable to that of the stone, the joints will hardly appear,

appear, and the whole work will seem as if one piece. This is the practice of Glasgow. In London and Edinburgh fine water putty is used instead of it.

All the stones of an ashler facing should be laid on their natural beds. From a neglect of this circumstance the stones frequently flush at the joints, and this disposition of the lamina sooner admits the corroding power of the atmosphere to take place.

In building walls or insulated pillars of very small horizontal dimensions, every stone should have its beds level and without any concavity in the middle: because if the beds are concave, when the pillars begin to sustain the weight of the fabric the joints will in all probability flush. It ought likewise to be observed that every course of masonry of such piers ought to consist of one stone.

Vitruvius has left us an account of the construction of the walls of the ancients, as follows. "The forts of walls are the reticulated, *Plate I. fig. 1*, and the ancient, which is called the incertain, *fig. 2*. Of these the reticulated is the handsomest, but the joints are so ordered that all the parts of the courses have an infirm position; whereas in the incertain, the materials rest firmly one upon the other, and are interwoven together; so that they are much stronger than the reticulated, though not so handsome. Both forts are formed of very small pieces, that the walls, being saturated with mortar, may endure the longer: for the stones, being of a porous and spongy nature, absorb the moisture from the mortar; and when there is an abundance of mortar, the wall, having more humidity, will not so soon decay, but will on that account be rendered more durable; for as soon as the humidity is extracted from the mortar by the suction of the stones, then the lime and sand separating the cement is dissolved, and the mortar no longer uniting the materials, the walls soon become ruinous. This may be observed in some tombs near the city, which are built with marble or hewn stone, and the internal parts rammed with rubble stones; the mortar being by length of time drained of its humidity by the suction of the stones, and the union of the joints being dissolved, they separate and fall to ruin.

"To avoid this error, the middle space (*fig. 2*) must be strengthened with abutments of the red hewn stone or bricks, or common flints, built in walls two feet thick, and bound to the front with cramps of iron fixed with lead; for the work being thus built in a regular manner, and not laid in promiscuous heaps, will remain without defect; and being by the orderly arrangement of the courses and joints firmly united and bound together, it will not be liable to fractures, nor will the abutments suffer it to fall to decay. For this reason the walls of the Greeks are not to be despised; for though they do not use smooth or polished materials, yet where they discontinue the square stones, they lay the flints, or common hard stones, that they use, in the same manner as bricks are generally laid, bending the courses together with alternate joints, and thus make their works strong and durable.

"These walls they build in two manners; one is called *Isodomum* (*fig. 3*), and the other *Pseudisodomum* (*fig. 4*). *Isodomum* is when all the courses are of an equal thickness; and *Pseudisodomum* when they are unequal. Both these forts are firm; first, because the stones themselves are of a compact and solid nature, and do not absorb the moisture from the mortar, but preserve its humidity to a great age; and, secondly, being situated in regular and level courses, the mortar is prevented from falling, and the whole thickness of the wall being united, it endures perpetually.

"Another fort is that which they call *Emplecton*, *fig. 5*

and 6.) which is also used by our villagers. The faces of the stones in this kind are smooth; the rest is left as it grows in the quarry, being secured with alternate joints and mortar; but our artificers, quickly raising a shell, which serves for the faces of the wall, fill the middle with rubble and mortar: the walls, therefore, consist of three coats, two being the faces, and one the rubble core in the middle, *figs. 5 and 6*. But the Greeks do not build in that manner; they not only build the facing courses regularly, but also use alternate joints throughout the whole thickness, not ramming the middle with rubble, but building it the same as the face, and of one united coat construct the wall: besides this, they dispose single pieces (A), which they call *diatonos*, in the thickness of the wall, extending from one face to the other, which bind and exceedingly strengthen the walls. Those, therefore, who would build works of long duration, must attend to these rules, and make use of such methods of building; for the smooth polish, and beautiful appearance of the stones, will not prevent the wall from being ruined by age."

An arch, in masonry, is a part of a building suspended over a given plan, supported only at the extremities, and concave towards the plan.

The supports of an arch are called the *spring walls*.

The whole of the under surface of the arch opposite to the plan is called the *intrados* of the arch, and the upper surface is called the *extrados*.

The boundary line, or lines of the intrados, or those common to the supports and the intrados, are called the *springing lines* of the arch.

A line extending from any point in the springing line on one side of the arch, to the springing line on the opposite side of the arch, is called the *chord* or *span* of the arch.

If a vertical plane be supposed to be contained by the span and the intrados of the arch, it is called the section of the hollow of the arch.

The vertical line drawn on the section from the middle of the spanning line to the intrados, is called the *height* of the arch, as also the middle line of the arch, and the part of the arch at the upper extremity of this line is called the *crown* of the arch.

Each of the curved parts on the top of the section, between the crown and each extremity of the spanning line, is called the *haunches* or *flanks* of the arch.

The section of almost every given arch used in building has the following properties: the upper part is one continued curve, concave towards the span, or two curves forming an interior angle at the crown, both concave towards the spanning line.

Every two vertical lines on the section equidistant from each extremity, and parallel to the middle line, are equal.

The above definitions and propositions not only apply to arches with level bases, but also to arches which stand upon inclined bases.

When the base of the section or spanning line is parallel to the horizon, the section will consist of two equal and similar parts, so that if one were conceived to be folded upon the other, the boundaries of both would coincide.

Arches, the intrados of which is the surface of a geometrical solid that would fill the void, are variously named, according to the figure of the section of that solid perpendicular to the axis, as *circular*, *elliptical*, *cycloidal*, *catenarian*, *parabohical*, &c.

Arches of the circular kind have two distinctions, *viz.* the semicircle, and those of segments less than a semicircle, are called *scheme* or *skene* arches.

There are also *pointed, composite, lancet, or Gothic* arches, which are formed in the face of the wall, or in sections parallel thereto, with the intrados of the arch.

When the extremities of an arch rise from supports at unequal heights, such an arch is called a *rampant* arch.

When a vertical line is drawn upwards, through each extremity of the spanning line, so as to cut off equal and similar parts of the intrados, the arch is called a *horse-shoe* arch, or *Moresque* arch. Hence, in this kind of arch, the spanning line is less than any other line or chord drawn parallel to the span, but under the top of each said vertical line.

When the upper line or side of an arch is parallel to the under line or side, the arch is called an *extradosed* arch.

A simple vault is an interior concavity extended over two parallel opposite walls, or over all the diametrically opposite parts of one circular wall. An arch or vault are frequently understood as synonymous; but the distinction which we shall here observe is, that an arch, though it may be extended over any space, has a very narrow intrados, not exceeding four or five feet; whereas a vault may be extended to any limit more than four or five feet. Thus, we frequently say an arch in a wall, but we never say a vault in a wall; though nothing is more common than to say a vaulted apartment, a vaulted room, a vaulted cellar, &c. So that a vault, as Sir Henry Wotton has observed, is an extended arch; we shall therefore apply arch to the head of the aperture in a wall which shews curvilinear interfections with the faces of the wall, and the word vault to arched apartments. We frequently, however, call the stone-work suspended over an apartment an arch as well as a vault, so that every vault is an arch, but every arch is not a vault.

The intrados of a simple vault is generally formed of the portion of a cylinder, cylindroid, sphere, or spheroid, never greater than the half of the solid; and the springing lines which terminate the walls, or where the vault begins to rise, are generally straight lines parallel to the axis of the cylinder or cylindroid, or the circumference of a circle or ellipse.

A circular wall is generally terminated with a spherical vault, which is either hemispherical, or a portion of the sphere less than a hemisphere.

A vaulted apartment, surrounded by an elliptic wall, is generally covered with a spheroidal vault, which is either a hemispheroid, or a portion less than a hemispheroid.

A conic surface is seldom employed in vaulting; but when the vault is to have this kind of intrados, the intrados should be the half of a cone with its axis in a horizontal position, or a whole cone with its axis in a vertical position.

All vaults which have a horizontal straight axis are called straight vaults.

Besides what we have already denominated an arch, the concavities which two solids form at an angle are called an arch.

If one cylinder pierce another of a greater diameter, the arch is called a cylindro-cylindric arch; the cylindro being applied to the cylindrical part which has the greater diameter, and the cylindric to that which has the less.

If a cylinder pierce a sphere of greater diameter than the cylinder, the arch is called a spherocylindric arch; and on the contrary, if a sphere pierce a cylinder of greater diameter than the sphere, the arch is denominated a cylindrospheric arch.

If a cylinder pierce a cone so as to make a complete perforation through the cone, two complete arches will be formed, called cono-cylindric arches; and on the contrary, if a cone pierce a cylinder so as to make the interior concavity through the cylinder a complete conic surface, the arch is called a cylindro-conic arch.

If a straight wall be pierced with a cylindric aperture quite through, two arches will be formed, called plano-cylindric arches.

Every species of arches is thus denoted by two preceding words; the former ending in *o*, signifying the principal vault or surface cut through, and the latter in *ic*, signifying the kind of aperture which pierces the wall or vault.

When two cylindric vaults, or two cylindroid vaults, or a cylindric and cylindroid vault pierce each other, and also their axes, so that the diameter of each hollow may be the same when measured perpendicular to a plane passing through the axis of both surfaces, the figure so formed is called a groin: but for more particular information on this point, see the article GROIN.

The formation of stone arches, in various cases, has always been looked upon as a most curious and useful acquisition to the operative mason, or to the architect, or other person who is appointed to superintend the work. In order to remove the difficulties experienced in the construction of cylindric or cylindroid arches, both in straight and circular walls, we shall here shew an example of each:

First, let it be required to construct a semi-cylindroidic arch cutting a straight wall with its axis oblique to the surface of the wall, but parallel to the horizon.

Let A B C D (Plate II. fig. 1.) be the plan of the aperture, A D and B C being the plan of the jambs; and A B and D C the plan of the sides of the wall: produce D A and C B to G and F: draw the straight line I G M F E at right angles with A G and C F: bisect G F at M: draw M H K perpendicular to G F: make M H equal to the height of the intrados of the arch, and describe the semi-ellipsis G H F, which is the section of the intrados of the arch: make G I, H K, and F E equal to the breadth of the beds of the arch stone, and describe the semi-ellipsis I K E, which is the section of the extrados of the arch. Now suppose the distances between the joints around the intrados of the arch to be all equal, and all the joints to tend to the centre M; divide the semi-ellipsis into such an odd number of equal parts, that each part may be in breadth equal to what is intended for the thickness of the stones at that part; produce E I to S, and extend the whole number of division from G to S; and through the points of division draw lines perpendicular to G S, or parallel to A G. Through all the points of division of the ellipsis G H F, draw lines parallel to G A to meet A B; then take the lengths of all the parts of the lines so drawn that are terminated by G F and A B as follows: viz. make the first line on the left of G A equal to the first on the right of G A, and the point *b* will be obtained; and the second on the left of G A equal to the second on the right of G A, and the point *c* will be obtained: proceed in this manner until all the other points are obtained; then a curve being drawn through all the points A, *b*, *c*, *d*, &c. to T, will give the one edge of the envelope of the intrados of the arch; and by producing the perpendiculars erected upon G S to the points *e*, *f*, *g*, &c. and making the several distances *b e*, *c f*, *d g*, &c. equal to A D or B C, the points D, *e*, *f*, *g*, &c. to U, will give the other edge of the envelope by tracing a curve through them; then A *b e d*, *b c f e*, *c d g f*, &c. are the soffits of the stones.

To find any bevel which the joints on the face of the arch makes with that on the intrados of the same. Let $p q$ be one of the joints tending to the centre M of the section of the arch: with the radius $M G$ describe an arc $G N O$, cutting $p q$ at N : draw $N P$ parallel to $G A$, cutting $A B$ at P : draw $P Q$ parallel to $F G$, cutting $G A$ at Q : draw $M L$ parallel to $G A$, cutting $A B$ at L , and join $L O$; then $Q L M$ is the bevel required: in the same manner may all the remaining bevels be found.

Again, let $p q r s$ be the section of an arch stone, then making two bevels, one to $q p s$ and the other to $r s p$, will be all the bevels that are necessary for that stone. Having obtained the several bevels, we shall now proceed to work the arch stone, whose section is $p q r s$: first work the lower bed of the stone corresponding to the joint $p q$, then draw a line for the soffit, which work also by means of the bevel $q p s$; then gauge the soffit to its breadth, and work the upper bed of the stone by means of the bevel $r s p$; then take the soffit mould from the envelope, and draw the ends of the stone which coincides with the faces of the wall; then with the face bevels $Q L M$, and $V L M$, work the face of the stone.

Note, that finding the bevels for half the arch will be sufficient by reversing them.

The other arch standing upon $D C$ shews the ends of the stones in the face of the wall; its boundaries are two ellipses of equal height to those of the section.

To construct a cylindro-cylindric arch, or a cylindric arch in a cylindric wall, the axis of the aperture being at right angles with the axis of the cylindric wall. Let $A B C D$ be the half plan of the wall, $B C$ being half of the convex curve, $A D$ half of the concave curve, $C D$ the middle line of the aperture tending to the centre of the concentric circles which form the plan, and $A B$ parallel to $C D$, being the jamb. Through C draw $E F$ perpendicular to $C D$: make $C E$ and $C F$ half the breadth of the aperture: from the centre C , with the radius $C E$ or $C F$, describe the semicircle $E G F$, which will be the section of the intrados: produce $C E$ and $C F$ to H and I , making $E H$ and $F I$ each equal to the breadth of the beds, and describe the semicircle $H K I$: divide the intradosal curve $E G F$ into the number of parts answering to the number of arch stones, and proceed to find the envelope, as described, for the straight wall, which will give the moulds for the soffits of the stones as before.

To find the curves of the ends of the beds upon the face of the arch. Let $L M$ represent a joint: draw $L N$ and $M O$ perpendicular to $H I$, cutting the plan of the wall at N and O : draw $N P$ parallel to $C I$, cutting $M O$ at P : in $L M$ take any number of points t and y , and draw $t s$ and $y w$ parallel to $L N$, cutting the plan at s and w , and $N P$ at r and v : draw $M Q$, $t u$, $y z$, perpendicular to $L N$: make $M Q$, $t u$, $y z$, respectively equal to $P O$, $r s$, $v w$, and $L x u Q$ will be the curve of the joint required; which gives the face line of the upper bed of the lower stone, and the face line of the lower bed of the upper stone. In the same manner all the other face lines of the beds are to be found. The templet must be cut in the shape of $L M Q$.

To form an arch stone. First make one of the beds, then make the soffit, then form the other bed, then form the face lines of each bed, then run a draught round the three face lines, then between these work the face of the stone in lines perpendicular to the horizon. This will be easily found by drawing a vertical line upon the section of each stone.

It is only necessary to draw the moulds for one half of

the arch, as the reversing of them in their application gives the stones of the other half.

The joints of any arch whatever may be found in the same manner, provided that the planes of the beds intersect a vertical plane perpendicular to the curve in the middle of the aperture.

It is obvious, on finding the face lines of the beds, that the lowest face line is the quickest, and part of the plan of the wall itself; the next face line is flatter, or has less curvature, and thus each successive face line has less curvature as it comes nearer to the top, and if there were a joint in the top, the face line of the beds would be quite a straight line. Indeed, the face lines of two or three courses might be wrought with straight edges, as the difference could hardly be perceived.

MASORA, a term in the *Jewish Theology*, signifying a work on the bible, performed by several learned rabbins, to secure it from alterations which might otherwise happen.

Their work regards merely the letter of the Hebrew text; in which they have, first, fixed the true reading, as well as the right method of writing and pronouncing, by vowels, pauses, and accents: they have, secondly, numbered not only the chapters and sections, but the verses, words, and letters of the text: and they find in the Pentateuch 5245 verses, and in the whole bible 23,206. The masora is called, by the Jews, the hedge or fence of the law, because this enumeration of the verses, &c. is a means of preserving it from being corrupted and altered. They have, thirdly, marked whatever irregularities occur in any of the letters of the Hebrew text; such as the different size of the letters, their various positions and inversions, &c. and they have been fruitful in finding out reasons for these irregularities and mysteries in them. (See CABBALISTS.) They are, fourthly, supposed to be the authors of the Keri and Chetibh, or the marginal corrections of the text in our Hebrew bibles. See KERI-CHEITIB.

The text of the sacred books, it is to be observed, was originally written without any breaks, or divisions into chapters or verses, or even into words; so that a whole book, in the ancient manner, was but one continued word; of this kind we have still several ancient manuscripts, both Greek and Latin. In regard, therefore, the sacred writings had undergone an infinite number of alterations, whence various readings had arisen, and the original was become much mangled and disguised, the Jews had recourse to a canon, which they judged infallible, to fix and ascertain the reading of the Hebrew text; and this rule they call *masora*, *tradition*, from מִסְרָה, *tradidit*, as if this critique were nothing but a tradition which they had received from their fore-fathers. Accordingly they say, that when God gave the law to Moses, at Mount Sinai, he taught him, first, the true reading of it, and, secondly, its true interpretation; and that both these were handed down by oral tradition, from generation to generation, till at length they were committed to writing. The former of these, *viz.* the true reading, is the subject of the masora; the latter, or true interpretation, that of the *misbna* and *gemara*; which see.

According to Elias Levita, they were the Jews of a famous school at Tiberias, about 500 years after Christ, who composed, or at least began, the masora; whence they are called masorites, and masoretic doctors. Aben Ezra makes them the authors of the points and accents in the Hebrew text, as we now find it; and which serve for vowels.

It is pretended by those who lay a great stress on the points, that the same word, being written with consonants only, as most of the Hebrew words are, has various significations, according to the vowels with which you read or pronounce

nounce it: e. g. the three letters **דבר**, *db'r*, have at least five different significations, viz. he spake, speaking, a word, a pestilence, and a fold for sheep or cattle. Whilst the Hebrew was a living language, there is no doubt that the word composed of these three letters was understood in its different significations by the different vowels that were used in it when they uttered it. Such vowel points, the Masorites have now affixed to it, by which we may know when and where these three letters signify one thing and when another. When it signifies "he spake," they affix the points which denote a short and e long, and say **דָּבַר**, *daber*. When it is a participle, and signifies "speaking," they read by their points **דְּבַר**, *dober*; when it is a noun, and signifies a "word," they put under it two a's short, and read **דָּבָר**, *dabar*, when it signifies a pestilence, they put two e's under, and read **דֶּבֶר**, *deber*, when it signifies a fold, they put the points which denote a and e, and read it **דָּבָר**; and so they have done with other words.

What has been done, in this case, by the Masorites, would certainly be of great use for understanding the Hebrew text, if they had lived while the Hebrew was a living language, and these points had been then used, and we could have been assured of their knowledge of the true pronunciation of all words, according to their different significations; but as the Hebrew was a dead language many hundred years before this time, the true ancient pronunciation was as much unknown then as now. We have St. Jerome's testimony, that different vowels were used in the pronunciation of the same word in different countries; and this was at least 100 years before the Masorites began the invention of their points, either for vowel, pause, or accent; and they were improving for some centuries. It is also manifest, from the LXX, that the ancient Jews read with different vowels from those which the Masorites have affixed. This is amply evinced by Masclef in his "Grammar." But if nothing more than the bare pronunciation of Hebrew words was concerned in the case, the matter would not be worth the least dispute. We know not how the ancient Greeks and Romans pronounced the Latin and Greek tongues. Every nation now gives the same sound to the Latin and Greek letters, which they give to those of their own language, which occasions those languages to be differently pronounced by different people. However, all write and interpret them in the same manner; which difference in pronouncing or speaking is of little consequence, but the case is different with regard to the Hebrew; most of the words in that language are written without vowels; and the question is, what vowels the words require to make the sense understood; not how the words are to be pronounced in speaking, when vowels are affixed to them. Therefore we say, that as it appears from the LXX, that the Jews, before our Saviour's time, used other vowels, by which they spake their words, than those which the Masorites have used; the consequence is, that the points which the Masorites have now affixed to every Hebrew letter, whether for vowel, pause, or accent, are of little or no authority, and deserve not to be regarded by us; and that the true sense of an Hebrew word, written only with consonants, is not to be filched from the points of the Masora, and the rules given concerning them, but from the context and construction, and the assistance of the LXX, and other ancient translations. Although we cannot charge the Jews with wilful falsification of the Hebrew text, that is, they have not designedly changed the letters of their bibles, yet we cannot say that they have not in some places wilfully falsi-

fied the sense by their points, of which Masclef gives us an instance in his arguments for his "New Grammar," with regard to the famous prophecy in Gen. xlix. The learned Mr. Johnson of Cranbrook, in a posthumous discourse on Daniel's 70 weeks, has also observed how the Masorites have endeavoured to marr that prophecy also, by their points; putting a stop, which they call an "athnach," which answers to our semicolon, in the place where there ought to have been only a comma. And, as Mr. Johnson observes, our English translators took the present Hebrew text as it is printed by the Masorites, to be the only sense and meaning of the Old Testament. In Dan. ix. 25. they put their "athnach" or semicolon after the seven weeks, and thus cutting off the seven weeks from the three score and two weeks, make the prophecy wholly unserviceable to Christians; but if they had placed a comma after seven weeks, and their "athnach" or semicolon after three score and two weeks, the number of years, viz. 483 (69 weeks) would exactly point out the time when the Christian Messiah came. See POINTS, under which article this subject is farther discussed.

The age of the Masorites has been much disputed. Archbishop Usher places them before Jerome; Capel, at the end of the fifth century; father Morin in the tenth century; Dr. Kennicott about the year 800; Basnage says, that they were not a society, but a succession of men; and that the masora is the work of many grammarians, who, without associating and communicating their notions, composed this collection of criticisms on the Hebrew text. It is urged, that there were Masorites from the time of Ezra and the men of the great synagogue, to about the year of Christ 1030; and that Ben Ascher of Tiberias, and Ben Naphtali at Babylon, who were the best of the profession, and who, according to Basnage, were the inventors of the masora, flourished at this time. Each of these published a copy of the whole Hebrew text, as correct, says Dr. Prideaux, as they could make it. The eastern Jews have followed that of Ben Naphtali, and the western that of Ben Ascher; and all that has been done since is to copy after them, without making any more corrections or masoretical criticisms.

The learned Walton, in the appendix to his Polyglott; has given us all the various readings of Ben Ascher and Ben Naphtali and the Oriental and Occidental Jews, and also of the Keri and Chetib; but we are still farther indebted to Dr. Kennicott for his admirable Hebrew bible and the Dissertatio Generalis annexed to it. See BIBLE.

The Arabs have done the same thing by their Koran, that the Masorites have done by the bible: nor do the Jews deny their having borrowed this expedient from the Arabs, who first put it in practice in the seventh century.

There is a great and a little masora, printed at Venice, and at Basil, with the Hebrew text, in a different character. Buxtorf has written a masoretic commentary, which he calls Tiberias. See on this subject, Dr. Brett's Dissertation on the ancient Versions of the Bible, &c. Lond. 1760, or Bishop Watson's Collection of Theological Tracts, vol. iii. Kennicott, ubi supra, and Dissertations; and Jennings's Jewish Ant. vol. i. p. 400, &c. and the various authors there cited.

MASORITES, Jewish doctors, authors of the masora.

MASOVIA, or MASUNEN, in Geography, a late palatinate of Poland, being one of the most ancient and one of the last that remained annexed to the crown. Masovia properly consisted of two palatinates, viz. Czersk or Masovia Proper, and Polotsk. This palatinate was seized by Prussia in the general division; but at the peace of Tilsit, it was

taken

taken from Prussia, and given to Saxony, forming a part of the duchy of Warfaw.

MASPA, a town of South America, in the audience of Quito; 40 miles N.W. of Archidona.

MASPALOMA, a town on the S.E. coast of Canary island; 12 miles S. of Palmas.

MASPHE, or MASPHE, in *Scripture Geography*, a country at the foot of mount Hermon, towards the springs of Jordan. Joshua says it was inhabited by the Hivites.

MASPHE, or *Maspeha*, a town of Judea, which belonged to the tribe of Gad, situated in the N. and E. part of the tribe of Gad. This town was taken and destroyed by Judas Maccabæus.

MASPHE, or MASPHEAT, a town of Judea, in the tribe of Benjamin. In this town were sometimes held the general assemblies of the Israelites. It was rebuilt by Afa king of Judah. Here Judas Maccabæus and his brethren assembled, in order to fight with Lysias, general of the army of Antiochus.

MASQUE, or MASK, a cover for the face, contrived with apertures for the eyes and mouth; originally worn chiefly by women of condition, either to preserve their complexion from the weather, or out of modesty to prevent their being known.

Poppæa, wife of Nero, is said to be the first inventor of the masque, which she continued to guard her complexion from the sun and weather, as being the most delicate woman, with regard to her person, that has been known. Theatrical masques were in common use, both among the Greeks and Romans; Suidas and Athenæus ascribe the invention of them to the poet Choerilus, a contemporary of Theſpis; Horace attributes them to Æschylus; but Aristotle informs us, that the real inventor, and, consequently, the time of their first introduction and use, were unknown. Brantome observes, that the common use of modern masques was not introduced till towards the end of the sixteenth century.

MASQUE is also used to signify any thing used to cover the face, and prevent a person's being known.

The penitents of Lyons and Avignon hide their faces with large white veils, which serve them for masques.

MASQUE, or *Masq*, a theatrical drama, much in favour in the courts of princes during the sixteenth and seventeenth centuries, in the latter, particularly in England.

According to Hall's Chronicle, the first masque performed in England was at Greenwich, 1512, "after the manner of Italy;" and Hollingshed says, that "there was not only a masque, but a good comedy of Plautus performed in 1520." In 1530, a masque was performed at Whitehall, "consisting of music, dancing, and a banquet, with a display of grotesque personages and fantastic dresses." This piece seems only to have wanted *machinery* to fulfil the idea of a complete masque, such as were afterwards written by Ben Jonson and others, which, with a constant musical declamation in *recitative* mixed with *air*, would have formed an opera exactly similar to the musical drama of Italy, in the ensuing century.

Shakspeare and Beaumont and Fletcher, have frequently introduced masques into their plays. Of the fourteen comedies of Shakspeare, there are but two or three in which he has not introduced singing; even in most of his tragedies, this wonderful and exquisite dramatick has manifested the same predilection for music.

The French and German writers on our musical dramas, confound *masque* with *masquerade*, and *mascherata* and *interlude* with the Italian *intermezzo*; but we had interludes long before the Italians had *intermezzi*, and our poems, or dramas,

called masques, bear no resemblance to an Italian *mascherata*. M. de Miffy, who in the *Bibl. Brit.* 1740, has given a regular series of our masques, more especially those of the seventeenth century, is constantly mistaken in these particulars.

Masques were certainly the precursors of operas in England, and belong to the chain of dramas which completed the union of poetry and music on our stage: and it does not appear, on examination, that the Italian *Mascherate*, published by Lafca, which have been thought their prototypes, were dialogued or performed on any stage. They seem to have been only processional songs, sung through the street by the representatives of different professions and trades, *masqued*, during carnival time. And the interludes which de Miffy and Riccoboni, and their translators, think we had from the Italian *intermezzi*, seem to want analogy: as *interlude*, with us, was a general name for every species of stage representation, out of the church.

Masques in England certainly bear some resemblance to operas: as they are in dialogue; performed on a stage; ornamented with machinery, dances, and decorations; and have always music, vocal and instrumental. But then the essential and characteristic criterion, recitative, is wanting, without which the resemblance is imperfect. Our musical pieces, which are sometimes honoured with the name of opera, differ in this particular so much, that they more resemble masques than the dramas which are entitled to that appellation; for, in English musical dramas, the dialogue is all declaimed or spoken in the same manner as in our old masques; and in Italy, whence we have both name and thing, an opera consists of both recitatives and airs, and is sung from the beginning to the end.

Riccoboni says, that James I., on coming to the crown in 1603, granted a licence to a company of players, in which patent interludes are included; but an interlude then was another word for a play, whether comedy, tragedy, or farce. Masques are not mentioned in this patent; but as masques, at this time, were court entertainments, or performed in the houses of the nobility, on particular occasions of festivity, the necessary machinery and decorations rendered such exhibitions too expensive for the ordinary public theatres. Indeed, the several parts in the masques of the sixteenth and seventeenth centuries were usually represented by the first personages in the kingdom; if at court, the king, queen, and princes of the blood often performed in them.

Masques appear to have been still more the favourite amusements of the court during the early and tranquil part of Charles I.'s reign than in that of James; and the queen, who seems to have brought with her from France at least as great a love for dramatic exhibitions as she found here, frequently represented the principal character in the piece herself. Most of the court masques were written by Ben Jonson, who, in his station of poet-laureat, seems to have furnished more of these dramas, than birthday or new-years odes. And though the masques of this reign are frequently said, in the title-page, and dramatick personæ, to have been performed by the king, queen, and nobles of their court, yet it does not appear that these great personages often took part in the dialogue or songs of the piece; but generally appeared on the stage in the splendid ballets only, as dancers, representing mythological or allegorical characters. Indeed, the queen, at the time of the first masques of this reign, can hardly be supposed sufficiently exercised in our language to undertake a part in which declamation was necessary.

In 1633, there were no less than five masques performed at different places before the king and queen, and personages

sonages of the court. A very circumstantial account of one of these has been left in a MS. by lord commissioner Whitelock, written by himself. It was acted at Whitehall, and the whole expence defrayed by the gentlemen of the four inns of court. The whole narrative of this masque is curious, and may be seen in Burney's General History of Music, vol. iii.

MASQUE, in *Architecture*, is applied to certain pieces of sculpture, representing some hideous forms, grotesque, or satyr's faces, &c. used to fill up and adorn vacant places, as in friezes, the pannels of doors, keys of arches, &c. but particularly in grottoes.

MASQUES and *Chilques*. See CHILQUES.

MASQUELONGE, or KENNONCHEQUE, in *Geography*, a river of America, which runs into lake Michigan, N. lat. 43° 10'. W. long. 87 4'.

MASQUE-POCONA, a jurisdiction of Peru, in the audience of Charcas, extending about 30 leagues. The temperature is hot, but not in a degree too great for vineyards. The valley in which the city stands is above eight leagues in circumference, and produces all kinds of grain and fruit; and the woods and uncultivated mountains afford great quantities of honey and wax, which constitute a principal branch of its commerce. The city of the same name, which is the usual residence of the bishop, is 80 leagues from Santa Cruz de la Sierra; it is very thinly inhabited, though in other parts of the jurisdiction there are several populous towns. Juan and Ulloa's Voyages to S. America, vol. ii.

MASQUERADE, or MASCARADE, an assembly of persons masked or disguised, meeting to dance or divert themselves. This was much in use with us, and has been long a very common practice abroad, especially in carnival times.

The word comes from the Italian *mascarata*, and that from the Arabic *mascara*, which signifies *railery*, *buffoonery*. Granacci, who died in 1543, is said to have been the first inventor of masquerades. Encyclopédie.

MASQUINONGE, in *Geography*, a lake of Canada; nine miles N.W. of Montreal. N. lat 47° 10'. W. long. 74° 10'.—Also, a river which runs into this lake.

MASRAKITHA, a pneumatic instrument of music among the ancient Hebrews, composed of pipes of various sizes, fitted into a kind of wooden chest, open at the top, and stopped at the bottom with wood covered with a skin. Wind was conveyed to it from the lips, by means of a pipe fixed to the chest; the pipes were of lengths musically proportioned to each other, and the melody was varied at pleasure, by stopping and unstopping with the fingers the apertures at the upper extremity.

MASRI, in *Geography*, a town of Persia, in the province of Kerman; 160 miles E.N.E. of Sirgian.

MASS, MASSA, in *Mechanics*, the matter of any body cohering with it; *i. e.* moving and gravitating along with it. In this sense, mass is distinguished from bulk or volume, which is the expansion of a body in length, breadth, and thickness.

The mass of any body is rightly estimated by its weight. And the masses of two bodies of the same weight are in a reciprocal ratio of their bulks.

MASS, or *Messe*, *Missa*, in a *religious sense*, denotes the office, or public prayers made in the Romish church, at the celebration of the eucharist.

Nicod, after Baronius, observes, that the word comes from the Hebrew, *missach*, *oblatum*; or from the Latin, *nissa*, *missorum*; because, in former times, the catechumens and excommunicated were sent out of the church,

when the deacon said, *Itē, missa est*, after sermon, and the reading of the epistle and gospel; they not being allowed to assist at the consecration. Menage derives the word from *nissio*, *dismissio*: others from *nissa*, *missio*, *sendo*: because, in the mass, the prayers of men on earth are sent up to heaven.

Romish divines define the mass, an oblation made to God, wherein, by the change of a sensible object by virtue of a divine institution, the sovereign dominion of God over all things is acknowledged.

This they esteem the greatest and most august ceremony in use in the church; as being the sacrifice of the new law, wherein the body and blood of Jesus Christ are offered up to God.

They are divided about the question, whether or no it be proper or allowable for the same person to celebrate mass several times in one day? Having the authority of pope Leo, in his letter to Dioscorus, for the affirmative side of the question, and that of several of the councils for the negative.

There is a great variety of masses in the Romish church; the thing acquiring new titles and appellations, according to the different rites, intentions, and manners, in which it is performed, as well as other circumstances. Thus they have a

MASS, *Ambrosian*, celebrated according to the rite of St. Ambrose; particularly used in Milan. See AMBROSIAN.

MASS, *English*, was the form which anciently obtained in England.

MASS, *Gallican*, is the rite that formerly obtained in the churches of France.

MASS, *Greek*, is that rehearsed according to the Greek rites, in the Greek language, and by Greek priests.

MASS, *Latin*, is that used in the Latin church, in the Latin tongue, and according to the rites of the Latin church.

MASS, *Mozarabic* or *Gothic*, is that which was formerly celebrated in Spain, the rites of which are still practised in the churches of Toledo and Salamanca.

MASS, *High*, called also *grand mass*, is that sung by the choristers, and celebrated with the assistance of a deacon and subdeacon.

MASS, *Low*, is that wherein the prayers are all barely rehearsed, without any singing, and performed without much ceremony, or the assistance of any deacon or subdeacon.

MASS of the *Beata*, or *our Lady*, is that offered to God, by the means and through the intercession of the Virgin.

MASS, *Beau*, is a mass rehearsed every day, at which the ladies and beau-monde of the place attend. This is also called the *perfumed mass*.

MASS, *Common*, or *mass of the community*, in a monastery, is that celebrated at certain hours, at which the whole body assists.

MASSSES, *Solitary*, or *Private*, were those that were celebrated by the priest alone, in behalf of the souls detained in purgatory, as well as upon some other particular occasions. These masses were prohibited by the laws of the church in the eighth century, but they were a rich source of profit to the clergy. They were condemned by the canons of a synod, assembled at Mentz, under Charlemagne, as criminal innovations, and as the fruits of avarice and sloth.

MASS of the *Holy Ghost*, is that celebrated at the beginning of any solemnity or church assembly, commencing with an invocation of the Holy Ghost.

MASS, Holiday, is that wherein certain prayers, or lessons, are read, suitable to the day.

MASS of judgment, was that wherein a person cleared himself of any calumny, by some proof agreed upon.

MASS for the death of our enemies, was a form that obtained a long time in Spain; but it was at length abolished, as inconsistent with Christian charity.

MASS of the dead, or requiem, is that performed at the request of the deceased: the introit whereof begins with Requiem. In the thirteenth century it was the custom, before criminals were carried out to execution, to make them attend at a mass of the dead, rehearsed for the repose of their souls.

MASS, Parish, or great mass, is that which the parson is obliged to rehearse to his parishioners on Sundays and holidays.

MASS, Little, is that said at private altars, with less ceremony. The first mass is that said at break of day.

MASS of a saint, is that wherein God is invoked by the intercession of some saint.

Thus there are also masses of apostles, martyrs, pontiffs, virgins, &c.

MASS of scrutiny, was formerly rehearsed at the examination of catechumens, when inquiry was made as to their disposition for baptism.

MASS, Silent. See *MESSA Bassa*.

MASS, Dry, is that where there is no consecration; as that, according to Durandus, where the priest cannot consecrate, by reason of his having said mass before on the same day; or it is that used by the candidates of the priesthood, in order to their becoming acquainted with the ceremonies; as Eckius will have it.

MASS, Votive, is an extraordinary mass, besides that of the day, rehearsed on some extraordinary occasion.

MASS of the presanctified, is that in which there is no consecration of the elements; but after singing some hymns, the bread and wine which were before consecrated are received. This mass is performed among the Greeks, who consecrate the eucharist in Lent only on Saturdays and Sundays. Among the Latins, it is used only on Good Friday.

MASS-books, importing or selling of, and other popish books, incurs a penalty of 40s. by 3 Jac. I. cap. 5. sec. 25.

MASS, Candle. See *CANDLE-mass*.

MASS, Childer. See *CHILDER-mass*.

MASS, Christ. See *CHRIST-mass*.

MASS of pope Julius is a very celebrated picture of Raphael representing the ceremony of the mass in the Vatican, and distinguished by its rich and excellent colouring.

MASS, in Painting, a technical term of the art, which implies an union of a variety of parts, so as to convey to the eye one undivided impression. It likewise signifies, in its ordinary sense, a large portion of one colour.

MASSA, in *Anatomy*, a name applied to one of the muscles of the foot, the flexor accessorius digitorum pedis; which is called *massa carnea* Sylvii. See *FLEXOR*.

MASSA, Duchy of, in Geography, a small principality, situated near the Mediterranean, between Genoa and Tuscany. This principality, and that of Carrara, were, before the French revolution, annexed to Modena, and were transferred with it to the Cisalpine republic. On a subsequent change in 1806, they were given to Lucca.

MASSA, a town of the republic of Lucca, and lately the capital of a duchy of the same name; situated on the river Frigida, near the sea: the see of a bishop, suffragan of Pisa; 53 miles S.S.W. of Modena. N. lat. $44^{\circ} 2'$. E. long. $10^{\circ} 1'$.—Also, a town of Etruria, in the state of Sienna, the see of a bishop, suffragan of Populonia. Borax and lapis lazuli are found in its vicinity; 24 miles S.W. of Sienna. N. lat. $43^{\circ} 5'$. E. long. $10^{\circ} 53'$.

MASSA di Sorrento, a sea-port town of Naples, in the province of Lavora, having a harbour for small vessels. On the sea-shore is an ancient temple adorned with marble columns, and a Mosaic pavement. It is now dedicated to St. Peter. It has a high watch-tower, like those along the coast: A little farther is the cape or promontory of Minerva, deriving its name from a temple in honour of that goddess, on an eminence facing Sorrento. Seneca calls this temple "Athenæum," as it had been built or consecrated to Pallas, goddess of Athens. On the site of its ruins is a watch-tower: from which medals and vases have been occasionally dug. This cape was fatal to most of the ships of L. Junius's fleet, who, failing to join those of P. Claudius Pulcher, his colleague, which had been defeated by Asdrubal, admiral of the Carthaginians, was driven by a storm against this promontory; and the losses sustained by the two consuls were so great, that the Carthaginians, in consequence of them, became masters of the sea for five or six years; or, till the battle won by C. Lutatius over them, which terminated the first Punic war; six miles S.W. of Sorrento.

MASSA, a town of Italy, in the department of the Lower Po; 24 miles S.S.E. of Ferrara.

MASSA, a town of Fez; eight miles S. of Salee.

MASSAC CREEK, a river of America, in Kentucky, which runs into the Ohio, N. lat. $36^{\circ} 47'$. W. lat. $89^{\circ} 25'$.

MASSAC Fort, a fort built by the French on the W. bank of the Ohio, near its mouth in N. lat. $37^{\circ} 15'$, 11 miles below the mouth of Tennessee river. A considerable quantity of land above and below the fort is annually inundated.

MASSACCIO, a town of Italy, in the marquisate of Ancona; 18 miles S.W. of Ancona.

MASSACHUSETTS PROPER, constituting with the district of *Maine* (which see), one of the United States of America, is situated between $41^{\circ} 13'$ and $43^{\circ} 52'$ N. lat. and between $69^{\circ} 50'$ and $73^{\circ} 10'$ W. long. Its greatest length is 190 miles, and its greatest breadth 90 miles: in its whole extent it contains 6250 square miles. On the N. it is bounded by Vermont and New Hampshire; E. by the Atlantic ocean; S. by the Atlantic, Rhode island, and Connecticut; and W. by New York. This part of Massachusetts is divided into twelve counties, which, with the number of houses, inhabitants, and chief towns in each, are exhibited in the following table.

MASSACHUSETTS.

Counties.	No. Towns in 1790.	No. Towns in 1800.	No. Houses in 1790.	No. Houses in 1800.	No. Inhab. in 1790.	No. Inhab. in 1800.	Chief Towns.	No. Inhab. in 1790.	No. Inhab. in 1800.

The capital of this state is *Boston*, which see: its population is about sixty persons for every square mile, and this is the only state in the union in which there are no slaves. The western part of this state is somewhat mountainous and hilly, and its climate resembles that of *New England*, to which we refer. By an admeasurement made by the barometer at Princeton, in this state, about 45 miles N.W. from Boston, and at Cambridge, in the year 1777, it appears that Princeton is 1332 feet higher than the level of the sea. The summit of Wachusset mountain in Princeton was found to be 2989 feet above the same level, and may be seen at the distance of 60 miles.

In Massachusetts are to be found all the varieties of soil, from very good to very bad, capable of yielding all the different productions common to the climate, such as Indian corn, rye, wheat, barley, oats, hemp, flax, hops, potatoes, field beans and peas, apples, pears, peaches, plums, cherries, grapes, &c. That part of the state which is distinguished by the name of the *Old or Plymouth Colony*, including the counties of Barnstable, Duke's, Nantucket, Bristol, and Plymouth, in point of soil, is the poorest part of the state, being generally sandy and light, interspersed, however, with many excellent tracts of land. The northern, middle, and western parts of the state, have, generally speaking, a strong good soil, adapted to grazing and grain; very similar to the soil of New Hampshire and Vermont on one side, and to that of Rhode island and Connecticut on the other. It has been observed that the effects of the east winds extend farther inland than formerly, and injure the tender fruits, particularly the peach, and even the more hardy apple. The average produce of the good lands, well cultivated, has been estimated as follows: 30 bushels of corn on an acre, 30 of barley, 20 of wheat, 15 of rye, 200 of potatoes. The best cultivated and most productive part of the state lies in the vicinity of Boston. Cambridge, Newton, Roxbury, Dorchester, and Dedham, are said to be literally gardens, from which the inhabitants of the capital are principally supplied with the finest fruits, roots, and vegetables. The staple commodities of this state are fish, beef, lumber, &c. The chief towns of this state, besides Boston the metropolis, are Salem, Newburyport, Charlestown, Worcester, Northampton, Springfield, Plymouth, Ipswich, &c. The

country is well watered by a number of small rivers, some of which fall into Connecticut river, which passes southerly through the W. part of the state; others run northward to Merrimack river, which enters from New Hampshire, and waters the N.E. corner of the state: others pass into Connecticut and Rhode island; Mytich and Charles rivers fall into Boston bay; and others fall into the Atlantic ocean in different parts of the sea-coast. The only capes of considerable note on the coast of this state, are cape Ann, on the N. side of Massachusetts bay, and cape Cod on the south. Besides these, there are cape Malabar, or Sandy point, extending ten miles S. from Chatham towards Nantucket, cape Poge, the N. point of Chabaquidick, and Gay Head, the west point of Martha's Vineyard. The chief bays on the coast are Ipswich, Boston, Plymouth, cape Cod or Barnstable, and Buzzard's. The islands scattered along the coast are numerous; the principal of which are Plum island, Nantucket, Martha's Vineyard, Elizabeth island, and Edgarton, which includes the fertile island of Chabaquidick; besides which there are many small isles in Boston bay. Within the state are several light-houses. Locks and canals in various parts of the state have been objects of contemplation; such as one between Barnstable bay and Buzzard's bay, another between Boston and some part of Connecticut river; and some others, all of which remain to be completed. The locks and canals in Connecticut river were projected for the purpose of rendering this river passable for boats and rafts from the mouth of Chickapee river, northward, throughout the commonwealth. By a subsequent law, two separate corporations have been formed; the one called the Upper Canals for improving the navigation of the river between the mouth of Deerfield river, and the head of the Miller's falls; the other, called the Lower Canals, for improving the navigation of the river between the head of the falls at South Hadley and the mouth of Chickapee river.

Iron ore, in immense quantities, has been found in various parts of this state, particularly in the old colony of Plymouth, which has become the seat of the iron manufactures. In the towns of Taunton, Bridgewater, Middleborough, &c. nails have been made in such quantities as to prevent, in a great measure, the importation of them from Great Britain.

The

MASSACHUSETTS.

The manufacture of nails has engaged particular attention, and machines have been constructed for facilitating and expediting it. Copper ore, black lead, white pipe-clay, yellow and red ochre, alum stone, ruddle or red earth, limestone, marble, asbestos, and pyrites, are supplied in different parts of this state. Several mineral springs have also been discovered. Manufactories of cotton and woollen have been attempted, with various success, at Beverley, Worcester, Bolton, and Newbury. There are in this state upwards of twenty paper-mills, which make more than 70,000 reams of writing, printing, and wrapping-paper annually. At Bolton, Cambridge, Lynn, Ipswich, Dedham, &c. are other manufactories for cotton and wool cards, playing cards, shoes, lace, wire, &c. There are also several snuff, oil, chocolate, and powder-mills in different parts of the state, and a variety of mills for sawing lumber, grinding grain, and fulling cloth. In 1792 there were 62 distilleries in this state, employed in distilling from foreign materials. The number of gallons distilled in one year has been 1,900,000, which at a duty of 11 cents a gallon, yields a revenue to the government of 209,000 dollars.

This state is also famous for its literary, humane, and other societies; such are the American Academy of Arts and Sciences, incorporated May 4, 1780; the Massachusetts Charitable Society, incorporated December 16, 1779; the Boston Episcopal Charity Society, incorporated Feb. 12, 1784; the Massachusetts Medical Society, incorporated Nov. 1, 1781; the Humane Society, incorporated in 1791; the Society for propagating the Gospel among the Indians and others in North America, incorporated Nov. 19, 1787; the Massachusetts Missionary Society, instituted in 1799; the Hampshire Missionary Society, instituted about the year 1800; the Berkshire and Columbia Missionary Society; the Massachusetts Baptist Missionary Society, instituted in 1802; and the Massachusetts Society for promoting Christian Knowledge, founded in 1804. To these we may add, the Massachusetts Society for promoting Agriculture, incorporated in 1792; the Historical Society, established in 1791; a Marine Society; the Massachusetts Congregational Society, incorporated for the relief of widows and children of deceased clergymen; the Middlesex Medical Society, founded in 1790; a Society for the Aid of Emigrants, instituted in 1793; the Massachusetts Charitable Fire Society, instituted in 1794; the Boston Mechanic Association, established in 1795, &c. &c. Schools and academies are very numerous. See also COLLEGE.

The commerce of Massachusetts is extensive and lucrative. Her ships visit almost all parts of the world. Her principal exports, of her own productions, consist of pot and pearl-ashes, flax-seed, whale-oil, spermaceti, whale-bone, spermaceti candles, fish dried and pickled, beef, pork, cheese, butter, and various other kinds of provisions, live stock, American rum, cotton and wool cards, men's and women's shoes, snuff and manufactured tobacco, household furniture, various kinds of lumber, as boards, planks, oars and rafters, oak and pine timber, shingles, staves and heading, ship-timber, &c. Of these articles, and others, the produce or manufacture of the state, together with articles of foreign growth, imported for exportation to other countries, were exported in the year ending September 30, 1791, to the amount of 2,445,975 dollars, 53 cents. Besides shoes, cards, hats, saddlery, and various other manufactures, and several articles the produce of the country to a great amount, exported to the southern and other states, not included in this amount.

In the year ending September 30, 1793, the exports from

this state (with the same exceptions and qualifications as above) amounted to 3,676,412 dollars; in 1799, to 11,421,591 dollars; and in 1804 to 16,894,379.

This state owns more than three times as many tons of shipping as any other of the states, and more than one-third part of the whole that belongs to the United States. Upwards of 29,000 tons are employed in carrying on the fisheries; 46,000 in the coating business, and 96,564 in trading with almost all parts of the world.

Pot and pearl-ash, staves, flax-seed, bees-wax, &c. are carried chiefly to Great Britain, in remittance for their manufactures; masts and provisions to the East Indies; fish, oil, beef, pork, lumber, candles, &c. are carried to the West Indies, for their produce, and the two first articles, fish and oil, to France, Spain, and Portugal; roots, vegetables, fruits, and small meats, to Nova Scotia and New Brunswick; hats, saddlery, cabinet work, men's and women's shoes, nails, tow-cloth, barley, hops, butter, cheese, &c. to the southern states. The Negro trade was prohibited by law in 1788, and there is not a single slave belonging to the commonwealth.

The principal sources of revenue are land and poll taxes, and the sales of new lands. Taxes are levied on all males upwards of sixteen, except such as are exempted by law; also on the number of acres of improved and unimproved land, on dwelling-houses and barns, ware-houses, stores, &c. These are all valued, and upon this valuation taxes are laid, at the rate of so many pounds for every 1000*l*.

In January 1805, the funds and expenditures of the commonwealth, as received from the treasurer, were as follows, *viz.*

	Dols.	Cts.
Amount of public debt, funded and unfunded, nearest	1,000,000	00
Funds of the commonwealth, as estimated January, 1805.

Dividends 7 to 8 per cent.		
per annum	1,718,421	34

Annual expence for the support of government, estimated January, 1805, nearest 175,000 dols.

The constitution of the commonwealth of Massachusetts established in 1780, contains a declaration of rights and a frame of government. The declaration asserts the natural freedom and equality of men—Liberty of conscience—Freedom of the press—Trial by jury—Sovereignty and independence—that all power is in the people—that hereditary honours and emoluments are inadmissible—that every subject is entitled to protection of life, liberty and property—and, in return, must obey the laws and pay his proportion of the common expence—that he shall not be obliged to accuse himself; but may be heard in his own defence—that he may keep arms; but standing armies shall not be maintained in time of peace—that no tax shall be levied without the consent

consent of the people by their representatives—that no *ex post facto* law shall be made—that the martial law shall extend only to men in actual military service—that the legislative, executive, and judiciary powers shall be kept distinct, &c. By the frame of government, the power of legislation is lodged in a general court, consisting of two branches, *viz.* a senate and a house of representatives, each having a negative upon the other. They meet annually on the last Wednesday in May. No act can be passed without the approbation of the governor, unless two-thirds of both branches are in favour of it after a revival. Either branch, or the governor and council, may require the opinion of the justices of the supreme judicial court, upon important questions. Senators are chosen by districts, of which there cannot be less than thirteen. The number of counsellors and senators for the whole commonwealth is forty; the number in each district is in proportion to their public taxes; but no district shall be so large, as to have more than six. Sixteen senators make a quorum. The representatives are chosen by the several towns, according to their numbers of rateable polls. For 150 polls one is elected; and for every addition of 225, an additional one. Their travelling expences, to and from the general court, are defrayed by the public, but their wages for attendance are paid by their own towns. Impeachments, for misconduct in office, are made by the representatives, and tried by the senate; but the judgment can go only to removal from office and future disqualification. Money bills originate in the house of representatives, but may be altered by the senate. Representatives are privileged from arrests on mesne process. Sixty members make a quorum. The supreme executive authority is vested in a governor, who is elected annually by the people, and has a council consisting of the lieutenant-governor, and nine gentlemen chosen out of the forty, who are returned for counsellors and senators. Five counsellors make a quorum. The governor is commander of all the military force of the commonwealth. He may convene the general court, may adjourn them, when the two branches may disagree about the time, and in their recess, may prorogue them from time to time, not exceeding ninety days—may pardon convicts, but the legislature alone can grant pardons before conviction. He commissions all officers, and with the advice of the council, appoints all judicial officers. Military officers are thus appointed; the respective companies choose their captain and subalterns, who choose their regimental officers, who choose their brigadiers. The major-generals are appointed by the general court. Justices of the peace are commissioned for seven years; all other judicial, and all executive and military officers continue during good behaviour, yet are removable by the governor upon address of the legislature. The salaries of the governor and justices of the supreme court cannot be diminished, although they may be enlarged. Official qualifications are as follows: for a voter, twenty-one years of age, one year's residence, a freehold of three pounds annual value, or sixty pounds of any other estate—for a representative, 100*l.* freehold, or 200*l.* other estate, and one year's residence in the town—for a senator, 300*l.* freehold, or 600*l.* other estate in the commonwealth, and five years residence in the district—for governor, or lieutenant-governor, 1000*l.* freehold, and seven years residence. Every governor, lieutenant-governor, counsellor, senator, or representative, must declare that he believes the Christian religion, and has the legal qualifications. A governor, lieutenant-governor, or justice of the supreme court, can hold no

other office. No man shall hold two of these offices, judge of probates, sheriff, register. No justices of the supreme court, secretary, attorney-general, treasurer, judge of probate, instructor of Harvard college, clerk, register, sheriff or custom officer, can have a seat in the legislature. The privilege of Habeas Corpus cannot be suspended more than a year at one time. In 1795, if two-thirds of the qualified voters desire it, a convention shall be called to revise the constitution. This period is now past; a vote for a revision could not be obtained; a convincing proof that the people feel themselves happy under their present government.

The militia of Massachusetts is composed of all the able-bodied white male citizens from 18 to 45 years of age, excepting from the enrolment, within those ages, clergy, school-masters, civil officers of importance, either under the state or federal government, and also those who have held any military commission whatever. The whole is formed into ten divisions, which, in January 1805, comprehended 58,879 infantry, 2679 cavalry, and 2581 artillery. These divisions are subdivided into 22 brigades, 90 regiments of infantry, 59 troops composing 18 squadrons or battalions of cavalry; and 54 companies of artillery: the latter are furnished each with two light brass pieces attached to the brigades, with tumbrils and apparatus complete; and have charge of various other heavy field-pieces, stationed all along the sea-coast. There is an annual return made of the whole militia to the adjutant-general, who makes out duplicate abstracts for the governor, and for the president of the United States.

The religion of this state is established by their constitution on a liberal and tolerant plan. All persons, of whatever religious profession or sentiments, may worship God agreeably to the dictates of their own consciences, unmolested, provided they do not disturb the peace. The great body of the people are Congregationalists, professing Calvinistic doctrines; but some are avowedly Arminians, and some Unitarians; and, as Morfe says, the latter it is supposed are increasing. Morfe's Geog. vol. i.

MASSACHUSETTS Fort, a fort of America, on the borders of Vermont and New York; nine miles S. of Bennington.

MASSACHUSETTS Sound, on the N.W. coast of America, is situated on the southern side of the Quadras isle.

MASSACIACOLI, a town of the republic of Lucca; nine miles S.W. of Lucca.

MASSACRE ISLAND. See MAOUNA.

MASSACRE River, a river of Hispaniola, which runs into the sea on the N. side of the island, N. lat. 19° 45'. W. long. 72° 32'.

MASSADA, in *Ancient Geography*, a fortress of Palestine, in the tribe of Judah, situated on the mountain Achila, N. of the town of Ziph, was built by one of the Maccabees. At the time of the reduction of Judea, A. D. 73, Flavius Silva, governor of Judea, made an expedition against this fortress. It was in the possession of Eleazar, a commander of the Sicarii. He was a descendant of Judas, who had persuaded many of the Jews not to submit to the assentment made by Cyrenius, when he came into Judea, after the removal of Archelaus. When there was no method of escaping, Eleazar called together the principal persons, and consulted with them what might be best to be done; at which time he addressed them with an oration, in order to induce them to kill themselves rather than to fall into the hands of the Romans. This oration had great effect on many;

some

some, however, hesitated; but in the progress of his address, all were persuaded. They then chose ten men of the number, by lot, to slay all the rest. When these ten men had executed their commission, and slain men, women, and children, they cast lots upon themselves, and he who had the first lot killed the other nine, and then himself. There remained, however, one ancient woman, and another woman related to Eleazar, who exceeded most women in knowledge and prudence, and five children, who had hid themselves in a cavern under ground: they had carried water with them for their drink, and lay quiet there, while the rest were intent upon the slaughtering of each other. The whole number of these people, the women and children just mentioned, was 960. This slaughter was made on the 15th day of April, A. D. 73. Josephus.

MASSAFRA, in *Geography*, a town of Naples, in the province of Otranto; 9 miles N.W. of Otranto.

MASSAGANO, a town of Angola, and capital of a province, to which it gives name, on the Coanza; 100 miles E.S.E. of Loanda. S. lat. $9^{\circ} 54'$. E. long. $14^{\circ} 40'$.

MASSAGETES, in *Ancient Geography*, a people of Asia, who inhabited the country on the west of the Caspian sea, and who imitated the free Scythians in their habit, manner of living, arms, and warlike genius; but they used, besides bows and arrows, javelins and scymetars. Brasses served them instead of steel for making their offensive weapons, and their defensive armour was ornamented with gold. Their horses were likewise fenced with a breast-plate of brass, whilst their bridles and other furniture were adorned with gold; for silver and iron were not used by them, because their country did not produce these metals. Although every man was obliged to marry a wife, yet they held them all in common; so that when a man met with a woman to his liking, he took her into his chariot or waggon, and cohabited with her without any further ceremony, than hanging up his quiver at the head of it. This custom, Herodotus tells us, was unjustly attributed to all the Scythians by the Greeks, whereas it was peculiar to the Massagetes only. A more inhuman custom than this was adopted by them, according to this author, which was, that when a man had once attained to old age, which was not so much limited by law as inferred by concurring symptoms, all his relations met, and sacrificed him, together with a number of cattle of several kinds, and having boiled the flesh altogether, they sit down to it as a feast. This kind of death was accounted by them the most happy, as that of dying by sickness was reckoned unfortunate, because those who died in this way were buried, instead of acquiring the honour of being sacrificed to their gods, and feasted upon by their nearest relations, and intimate friends. The sun was the only deity they worshipped, and to him they sacrificed horses, which, being reckoned the noblest and swiftest of all creatures, they thought most proper to be offered to the noblest and swiftest of all the gods. They neither sowed nor planted; but contented themselves with the milk and flesh of their cattle, and with fish, of which the Iaxartes afforded a very great plenty. Herodotus, lib. i. cap. ult. and lib. iv. cap. 172. Anc. Un. Hist. vol. iv.

MASSAGONG, in *Geography*, a small island in the East Indian sea, near the east coast of Nassiau. S. lat. $3^{\circ} 8'$. E. long. $100^{\circ} 5'$.

MASSALAGEM, NEW, a sea-port town of Madagascar, on the W. coast. S. lat. $16^{\circ} 30'$. E. long. $63^{\circ} 10'$.

MASSALAGEM, OLD, a sea-port town of Madagascar, on the W. coast; 60 miles N. of New Massalagem.

MASSALIANS, MASSALIANI, in *Ecclesiastical History*, certain sectaries, so called from a Hebrew word, signifying

prayer; it being their distinguishing tenet, that a man is to be continually in prayer.

St. Epiphanius distinguishes two kinds of Massalians, the *ancient* and the *later*.

The *ancient*, according to him, were neither Jews, Christians, nor Samaritans, but pure Gentiles; who, owning several gods, adored only one, whom they called Almighty.

As to the *later* Massalians, who were by profession Christians, their rise was not till about the time of St. Epiphanius. Their doctrine was, that prayer alone was sufficient to salvation. Many monks, who loved a life of laziness, and were averse from labour, at times, joined these Massalians. See EUCHITES.

MASSANDRA, in *Geography*, an island of Africa, on the river Coanza; 24 miles from its mouth.

MASSANI, in *Ancient Geography*, a people of India, who, among others, were subdued by Alexander, according to Quintus Curtius. They inhabited a territory near the mouth of the river Indus.

MASSANIELLO, or ANELLO THOMAS, in *Biography*, a fisherman of Naples, a remarkable leader of revolt, which was caused on account of some unreasonable impositions in the shape of taxes. His father was a fisherman, and he was brought up to the same business, and was at a very early period distinguished among his companions by his courage, his activity, and integrity. From his person and manners he obtained the esteem and love of all who knew him. At the time when this obnoxious tax was introduced, *viz.* in the year 1647, Massaniello was twenty-four years of age, and had a wife and several children. His wife had been detected in smuggling a small quantity of meal for the support of her infant offspring, and had not only been imprisoned for the offence, but condemned to pay a large fine, for the discharge of which they were obliged to sell their furniture. Exasperated both on his own, and the public account, Massaniello excited his friends to assist him in driving away the officers: they were soon joined by the populace, who demolished all the tax-offices throughout the city, and then demanded the abolition of the tax itself. They not only carried their point, but obtained the offer to their leader, Massaniello, of a large pension, which he nobly refused. These concessions, instead of restoring order in the city, left it at the mercy of the mob; and at the instigation of some of the malecontents, Massaniello was induced to issue a command for burning the houses of all persons concerned in levying the tax, which was very readily executed. He then required the viceroy to abolish all taxes of every kind. This, and other concessions being allowed, Massaniello soon found himself at the head of a vast body of men, and exercised uncontrolled sway. He spent little time in refreshment or repose, gave his orders with precision and judgment, and appeared free from all personal views of interest or ambition; he began, however, to govern with more severity, and put to death several persons upon mere surmises. The viceroy, apprehending lest the French should take advantage of this confusion, entered into a treaty with Massaniello, granting every thing that had been demanded, and agreeing that he should retain his power, and the people their arms. This success was his ruin: intoxicated with power, and disordered by the constant agitation of his mind, he became frantic, and performed all sorts of extravagant actions, to which an end was put by his assassination, on the 18th of July, only ten days after his extraordinary elevation. Every indignity was shewn to his body; but in the course of a few days, the very rabble who had joined in throwing it into the common sewer, upon a temporary rise of provisions, reclaimed

it, and carried it through the streets in solemn procession, and gave it a magnificent burial. Mod. Univer. Hist.

MASSAPA, in *Geography*, a town of Africa, in the country of Mocaranga; 230 miles N.W. of Sofala. S. lat. 18° 10'. E. long. 32° 10'.

MASSARIA, ALEXANDER, in *Biography*, a physician of celebrity in the sixteenth century, was born at Vicenza, and graduated at Padua, where he studied under Fallopio, and the other eminent professors of that school. He then returned to his native place, where he practised his profession, with considerable reputation, for the space of twenty-five years; when his fame had recommended him to the magistracy of Venice, whither he was invited; and he settled there in the year 1578. Nine years afterwards, when Hieron. Mercurialis quitted his professorial chair, and removed to Bologna, Massaria was immediately appointed his successor. He performed the functions of his new office with considerable eclat, and attracted a large concourse of pupils; and at the same time was consulted by the first people of the state. He died suddenly in the year 1598, when upwards of seventy years of age. He was the author of several works; especially a treatise on the plague, on the abuse of blisters, on the proper use of blood-letting and purging in fevers, (in which he opposed the indiscriminate recommendation of that practice into which Botalius had fallen); and also on the diseases of women, and on syphilis. The work, which has been most frequently reprinted, was his "Practica Medica, seu Prælectiones Academicæ," a systematic treatise on the diseases of the whole body; first published at Francfort, in 1601. Eloy Dict. Hist. de la Méd.

MASSASYLIANS, in *Ancient Geography*, a people who inhabited the interior of Mauritania Cæfariensis, on the mountains called Durdus.

MASSAT, in *Geography*, a town of France, in the department of the Arriège, and chief place of a canton, in the district of St. Girons; nine miles W. of Tarascon. The place contains 7456, and the canton 12,157 inhabitants, on a territory of 157½ kilimètres, in four communes.

MASSEDAY BAY, a bay on the W. coast of Mexico, between Acapulco and Aquacaca, a port near the cape of California, where sir Thomas Cavendish lay after he had passed the straits of Magellan.

MASSEL, a town of Silesia, in the principality of Oels; three miles N.E. of Trebnitz, having near it an eminence called Toppleberg, which was once a famous Pagan burying ground.

MASSERANO, a town of France, in the department of the Sesia; lately the capital of a papal sief, insulated in Piedmont; 43 miles N.N.E. of Turin. N. lat. 45° 39'. E. long. 8° 9'.

MASSETER, in *Anatomy*, a powerful muscle belonging to the lower jaw: it is described in the article DEGLUTITION.

MASSEUBE, in *Geography*, a town of France, in the department of the Gers, and chief place of a canton, in the district of Mirande; nine miles S.E. of Mirande. The place contains 1250, and the canton 11,215 inhabitants, on a territory of 220 kilimètres, in 36 communes. N. lat. 43° 25'. E. long. 0° 39'.

MASSEY'S ISLAND, a small island in the Pacific ocean, discovered in 1790 by lieut. Ball; S.S.W. of Sirius island.

MASSEY'S TOWN lies on the northern bank of Ohio river in America, between Little Miami and Scioto rivers.

MASSI, a people of Africa, on the banks of the lake Meravi.

MASSIA, a river of Mexico, which runs into the Pacific ocean. N. lat. 16° 30'.

MASSIAC, a town of France, in the department of the Cantal, and chief place of a canton, in the district of St. Flour; 14 miles N. of St. Flour. The place contains 2522, and the canton 9870 inhabitants, on a territory of 252½ kilimètres, in 15 communes.

MASSIANAC, a town on the E. coast of Madagascar. S. lat. 22° 50'. E. long. 47° 55'.

MASSICOT. See MASTICOT.

MASSIESBURG, in *Geography*, a town of America, in the state of Ohio, and county of Adams, situated on the northern bank of the Ohio, 38 miles below the Scioto, or six miles above Limestone, in Kentucky, settled in 1790. About 10 miles above it is a thriving town, built on the N. bank of the Ohio, incorporated in 1802.

MASSIEU, WILLIAM, in *Biography*, a man of letters, was born at Caen in 1665. When he had finished his school studies, he was entered among the Jesuits, but in a short time he disengaged himself from the trammels of the society, and became a distinguished member of the French Academy and the Academy of Inscriptions and Belles Lettres. In 1710 he was nominated Greek professor in the college royal, a post which he retained till his death in 1722. He was profoundly skilled in the ancient languages, of which he gave proof by his various publications: of these the chief were "Memoirs of the Academy of Inscriptions," and "Histoire de la Poésie Française," which ranks very high, on account of its curious researches. Moreri.

MASSILARGUES, in *Geography*, a town of France, in the department of the Herault; 12 miles E.N.E. of Montpellier.

MASSILIA, Portus Græcorum (Marseilles), in *Ancient Geography*, a celebrated city of Gaul, in Gallia Narbonensis, and denominated by Cicero the Athens of the Gauls. Livy says that it was as much polished as if it had been in the midst of Greece. It was as much distinguished for its sciences and arts as for its commerce, and also for the variety and eminence of its colonies. Cæsar says that it was almost surrounded on three sides by the sea, and on the other land side very strong, partly by its situation, and partly by a deep ditch, which guarded its ramparts. Strabo says that it was large, encompassed by good walls, and situated on a hill in the form of an amphitheatre above its harbour. This town was founded by a colony from Phocæa, a celebrated city of Ionia. Two persons were deputed for this purpose, who carried with them a number of persons of both sexes, together with various instruments adapted to the mechanic arts and to agriculture, and also the laws according to which the colony was to be governed. They were directed by the oracle to touch at Ephesus, and to put themselves under the conduct of the person whom Diana should point out to them. A female was warned by Diana of their arrival in a dream, and ordered to take with her one of her statues, and to accompany these strangers. She also took from the temple some of the sacred fire, which was to be perpetuated in the new temple that was to be erected at Marseilles in honour of the goddess by whom she was deputed. The first object of attention to the Phocæans, when they entered the gulf where they were to build this city, was to gain the protection and favour of the prince who reigned in this country. On the day of their arrival the daughter of the prince was to be married: and, according to the custom of the Gauls, she presented a cup of water to the object of her choice. One of the Phocæans engaged her affection and attachment, and to him she presented the significative cup. Her father approved

proved her choice, and assigned to the Phocæans a portion of land, where they established themselves in the first year of the 45th olympiad, or the 600th year B.C. Allowing for the mixture of fable and truth in this relation, we may deduce from it the time when the city of Marseilles was established, and the country from which its founders emigrated. Having encompassed the new city with walls, and constructed a citadel for its defence, they established a government upon the basis of those laws which they had brought with them, and decreed to Diana of Ephefus, who became the tutelary divinity of Marseilles, a particular worship in the temple which they built for her, and of which the female who conducted them thither was the first priestess. Agriculture and fishery were the objects of their attention and the sources of their subsistence: they cultivated the vine and the olive, which were probably the first productions which they transplanted into Gaul. Our limits will not allow our tracing the particulars of their history through the vicissitudes of subsequent centuries. For many ages they are said to have maintained their original simplicity and frugality, and to have distinguished themselves by their hospitality to strangers, and their compassion to the indigent. About 320 years B.C., Pytheas, an ingenious astronomer of this city, undertook to perfect navigation, and to discover countries whither they might extend their commerce. With this view he navigated northwards, and on his return, entered into the Baltic sea. About the same time another citizen of similar talents and pursuits, called Euthymenes, examined the western coasts of Africa, and reconnoitred the mouth of the Senegal. These two voyages were undertaken at the expence of the republic. These voyages, and other circumstances, served to extend their commerce and to improve their maritime power. Before the siege of this city by Cæsar, it had sent its ships to the Levant, Africa, Spain, and England; and it held a principal rank among republics. During the disputes between Pompey and Cæsar, Marseilles took part with the former, and refused to open its gates to the latter, though he appeared before it at the head of three legions. Cæsar prosecuted the siege of the city, which, after long resistance, and much internal distress, was obliged to surrender at discretion. The victor, in consideration of the antiquity of the city, and the celebrity which it had acquired by its culture of the sciences and arts, abstained from the horrors of pillage; but deprived it of its dependant towns and colonies, and destroyed its fortifications and warlike machines, and having demanded the surrender of its arms, vessels, and money, placed in it a garrison of two legions. Contenting himself, however, with disarming the inhabitants, he allowed them to live under their own laws and to enjoy the advantages of commerce. From the capture of the city to the time when Augustus became sole master of Rome, nothing particularly worthy of notice happened in this province. For about a century afterwards, this city was governed under the form of a republic, enjoying the protection and subject to the authority of the Roman empire. Marseilles, having enriched itself by its industry and frugality, became, at length, the victim of luxury and extravagance, inasmuch, that in the second century of the Christian era, the inhabitants gave occasion for the proverb, "Massiliam naviges," to express a disposition for a life of debauchery. About the year 150, the Christian religion was introduced into this city. Massilia produced a number of persons distinguished by their proficiency in science and literature. We have already mentioned Pytheas and Euthymenes. To these we may add Teron and Gyaræus, who flourished about 75 years before our era,

and were celebrated astronomers and mathematicians; Ofcus or Ofcius, born about 20 years B.C., a celebrated orator; Agrotas of the same character, and the contemporary of the former, who pleaded only in Greek; Paccatus, Petronius, Demosthenes, Crinas and Charmis, of whom the three last mentioned were celebrated physicians: the first an orator, and the second a poet.

In the cabinets of collectors are many medals of this city in silver and in bronze. The most common of the first sort have the head of Diana on one side, and a lion on the reverse. Those which have the head of Apollo and the two letters M A, are very common. The medals of Marseilles discovered in 1771, about four leagues from Aix, were of pure silver, and all of them had the head of Diana, with a lion on the reverse. See MARSEILLES.

MASSILLON, JOHN BAPTIST, in *Biography*, a French prelate, of great celebrity as a preacher, was born in 1663. At the age of eighteen he entered into the congregation of the Oratory, where he distinguished himself by his talents and agreeable manners. In process of time, he was appointed divinity professor at Vienne, and it was in this place that he made his first efforts in eloquence, on occasion of the death of Henry de Villars, archbishop of that city, whose funeral oration he pronounced. Soon after this he removed to Paris, where he adopted a mode of preaching that was peculiarly his own: his style and language were simple, elegant, and perspicuous; his imagination lively, his images striking and natural; his thoughts just and delicate; and his representations animated and forcible. His manner of delivery likewise was admirably adapted to give success to the kind of eloquence to which his genius directed him. The fame of Massillon excited the curiosity of the king to hear him; he was appointed to preach a course of sermons at Versailles, and the church was crowded with auditors. It was on one of these occasions that Lewis XIV. paid him this fine compliment: "My father," said he, "I have often had my pulpit filled by celebrated orators, with whom I am greatly pleased, but whenever I hear you, I am much displeas'd with myself." In the year 1717, he was nominated to the bishopric of Clermont, but before his consecration he was called on to preach a course of Lent sermons before the young king, Lewis XV.: these, being ten in number, are known by the name of *Le petit Carême*, and were composed by the author in less than ten months, and are said by d'Alembert to exhibit a model of true pulpit eloquence. After having been called to some public services, such as pronouncing the funeral oration for Elizabeth Charlotte of Bavaria, duchess dowager of Orleans, and having obtained other church preferment, he spent the remainder of his life almost entirely in his diocese, diligently occupied in the discharge of his episcopal functions, and gaining the affections of all classes of the people. He died in 1742, about the age of seventy-nine, deeply lamented by the flock over which he presided, and that had been accustomed to regard him with filial reverence and affection. His works were collected and published by his nephew, in the years 1745 and 1746, in 14 vols. 12mo. They contain a complete "Course of Sermons for Advent and Lent:" "The Petit Carême:" "Funeral Orations," &c. Moreri.

MASSIMA, Ital. *Maxima*, Lat. in *Music*, the longest note in the first time-table of the early contrapuntists. Its form is an oblong square, with a tail to it, thus:  It is equal in duration to two longs, four breves, and eight semi-breves.

MASSINA, in *Geography*. See MASINA.

MASSING, in *Painting*, the art of producing an union of effect in the various parts of a picture.

Upon the ingenuity with which the smaller parts are united together, either by blending their edges or merely approximating them, and thus forming the larger masses of light, shade, or colour, depends all the beauty of chiaro-scuro, and it can only be agreeably effected by the hand of taste. It has been generally agreed amongst artists and connoisseurs, that in order to make a picture agreeable it should have three distinct masses of light, one larger, and two smaller ones. The arrangement and scale of them are arbitrary.

The manner employed by sir Joshua Reynolds to inform himself of the mode in which the great artists of Italy had regulated their works with regard to the general masses, is simple, and so completely effective, that nothing farther than a transcript of it need be added for the benefit of those who are pursuing the art. In note 39 to Mason's translation of Fresnoy's poem on painting, he says, "When I was at Venice, the method I took to avail myself of their principles was this. When I observed any extraordinary effect of light and shade in any picture, I took a leaf of my pocket-book, and darkened every part of it, in the same gradation of light and shade as the picture, leaving the white paper untouched to represent the light; and this without any attention to the figures. A few trials of this kind will be sufficient to give the method of their conduct in the management of their lights. After a few experiments I found the paper blotted nearly alike. Their general practice appeared to be, to allow not above a quarter of the picture for the light, including in this portion both the principal and secondary lights, another quarter to be as dark as possible, and the remaining half kept in mezzotint, or half-shadow."—"By this means you may also remark the various forms and shapes of those lights; what portion is strongly relieved, and how much united with the ground."—And in note 41 he adds, "the same method may be used to acquire that harmonious effect of colours, by adding colours to the darkened paper, to ascertain the quantity of warm and the quantity of cold colours."—"The predominant colours of a picture ought to be of a warm mellow kind, as red or yellow, and no more cold colour introduced than will be just enough to serve as a ground, or foil to set off, and give value to the mellow colours; and never should itself be a principal. For this purpose a quarter of the picture will be sufficient; those cold colours, whether blue, grey, or green, are to be dispersed about the ground, or surrounding parts of the picture, wherever it has the appearance of wanting such a foil; but sparingly employed in the masses of light." For further information on this point, see the articles *CLAIR-OBSCURE*, and *EFFECT*.

MASSINGALES, in *Geography*, a place of America, in Sullivan's county, Tennessee, in which is a post-office; 427 miles from Washington.

MASSINGER, PHILIP, in *Biography*, an English poet and dramatic writer, was born in 1584 at Salisbury. His father, Arthur, was in the service of Henry, second earl of Pembroke, in whose family Philip was probably educated. His college studies he pursued at St. Alban's hall, Oxford; but it is asserted by Anthony Wood, that in the university he gave his mind more to poetry and romance, than to the studies of the place. He left his college without a degree, and his father being dead, he found no other means of support than the employment of his talents as a writer for the stage. From 1606 to 1622, a space of 16 years, he was scarcely known to the public in the profession he had embraced: he was during that period probably employed in giving assistance to other writers of more celebrity, and there is good reason for believing that he was a coadjutor to Fletcher in some pieces that bore his name, though he was in such em-

barrassed circumstances, as to supplicate the loan of almost the smallest sum to prevent him from being sent to gaol. In the last of the years above-mentioned, his first printed play made its appearance under the title of the "*Virgin-Martyr*." There are few facts on record respecting the life of Massinger: it appears, however, that, in his circumstances, he never rose above indigence, and that from his own dedications he would have found it difficult to subsist, had he not received the aid of liberal benefactors. He died of a sudden indisposition in the month of March 1640, and was buried by the side of Fletcher, in the church-yard of St. Saviour's, Southwark. The list given of plays composed either wholly or in part by Massinger amounts to thirty-eight, of which seventeen only are printed in the most complete edition. They are but little known, nor have any of them the present possession of the stage, excepting his comedy of "*A New Way to pay old Debts*," which is sometimes acted. His chief excellence is in tragedy, and according to an approved critic, "it would not be easy to name one of the early English dramatists who has surpassed him in harmony of verse and beauty of language, or in strength of character. His popularity was never equal to that of Shakspeare, Jonson, Beaumont, and Fletcher: his pieces have the irregularity of plot common at that period, with a mixture of low and gross scenes; the portraits are drawn more from general ideas of his own conception, than from the observation of real nature; and his knowledge of the human heart is much inferior to that of Shakspeare, to whom, in some respects, there is a great similarity. His morality is generally pure, though his language is often gross and indelicate." The best edition of his works is that of Mr. Gifford, in four volumes, 8vo. 1805, to which the reader is referred for a more full account of the author.

MASSINISSA was an African prince of great fame; he was the son of Gala, king of the Maffyli, one of the tribes composing the Numidian nation. In the year 213, B. C. Massinissa, then about 17 years of age, was sent by his father, who had made a treaty with the Carthaginians, against Syphax, king of another tribe of the Numidians, whom he twice defeated. After this he served at the head of the Numidian auxiliaries of the Carthaginians in Spain, and had a large share in the defeat and death of the two Scipios. When young Scipio had restored the Roman superiority in that country, Massinissa privately entered into a negotiation with him and became an ally of the Romans; and to his exertions they owed many of their victories in Africa. After the death of his father, his eldest brother, and his nephew, Massinissa, who had been deprived of his inheritance, obtained succours from Bocchar, king of Mauritania, expelled his competitors, and placed himself on the Maffylian throne. Syphax, dreading his ambition and martial talents, attacked him with a numerous army, and, gaining a signal victory over Massinissa, obliged him to take refuge on mount Balbus. From this place he made frequent incursions on the adjacent Carthaginian territory, and proved so troublesome, that Syphax sent against him one of his most active commanders, with orders to bring him either dead or alive. He was now under the necessity of concealment, and actually lived for a time in a cave, supported by the plunder of his two attendants. At length he resolved to make an attempt at recovering his kingdom, and being joined by a number of partisans, he not only recovered the throne of the Maffyli, but was able to make incursions on the dominions of Syphax. In the battle of Zama, Massinissa greatly contributed to the defeat of the great Hannibal, and the Romans, who had been frequently the spectators of his courage and valour, rewarded his fidelity with

with the kingdom of Syphax, and some of the Carthaginian territories. At his death, Massinissa shewed the confidence he had in the Romans, and the high estimation in which he held the rising talents of Scipio Æmilianus, by entrusting him with the care of his kingdom, and empowering him to divide it among his sons. He was more than ninety years of age when he died, and had reigned about sixty years. He experienced adversity as well as prosperity, and in the early periods of his reign he was exposed to the greatest danger, and was, as we have seen, often obliged to save his life by seeking a retreat among his savage neighbours. His alliance with the Romans was the beginning of his greatness, and ever after this he lived in the highest state of affluence. He is remarkable for the large share of health he enjoyed to the last. Toward the close of his life he was seen at the head of armies, exerting himself with the most indefatigable activity and ardour, and he often remained for many successive days on horseback without a saddle under him, or a covering for his head. He assigned the strength of his mind and the vigour of his body, chiefly to the great temperance which he observed. He was seen eating brown bread at the door of his tent, like a private soldier, the day after he had obtained an immortal victory over the armies of Carthage. He left fifty-four sons, of whom three only were legitimate, *viz.* Micipsa, Gulussa, and Manatabal. At his death he was the most powerful prince in Africa, his territories extending from Mauritania, to the western borders of Cyrenaica. His army at this time was numerous and well disciplined, and his treasury was full: he was undoubtedly one of the ablest sovereigns of his age, though little scrupulous in the means which he resorted to for his aggrandizement. Univer. Hist.

MASSISA, in *Geography*, a town of Asiatic Turkey, in Aladulia; 12 miles E. of Adana.

MASSIVE, something heavy and solid; a term used in opposition to tenderness and delicacy.

Thus we say, a building is too massive, that is, its walls are too thick; a wall is massive, that is, the lights and openings are too small in proportion.

MASSIVE Column. See **COLUMN**.

MASSON, M. in *Biography*, author of "A Treatise on Composition" in French, published in 1705, and much esteemed till that of Rameau appeared, in 1722. The author was maître de chapelle at Chalons, in Champagne. This work is divided into two parts; of which the first treats of melody, the second of harmony. The first part contains seven chapters, and the second ten; proceeding from two parts to four, and ending with instructions for composing a fugue.

MASSON, JOHN, a learned writer of the reformed church, was born in France, from which, on account of his religious opinions, he was obliged to make his escape, and became a refugee in England. From thence he passed into Holland. In 1708 he published, at Leyden, the lives of Horace and Ovid, in Latin: after this he wrote the life of Pliny the younger, prefixed to a splendid edition of his Epistles, printed at Amsterdam in 1734. In the year 1712 he commenced a work, entitled "Histoire critique de la Republic des Lettres," which he carried to sixteen volumes, 12mo. Masson is, likewise, supposed to be the author of the "History of Peter Bayle, and his Works."

MASSON, FRANCIS, a name which ranks very high among those who, by encountering personal difficulties and hardships, with the most indefatigable and disinterested zeal, have promoted botanical knowledge, was born at Aberdeen in August 1741. Whether he was originally educated as a gardener, or at what time he found his way

to London, we are not informed. It appears that, having been for some time known to the late excellent superintendent of the Royal Garden at Kew, Mr. Aiton, and probably employed under him there, he was fixed upon as a fit person to undertake some botanical expedition, for the purpose of enriching that collection, when the return of the celebrated Banks and Solander from their voyage round the world, gave a popularity and a stimulus to every exertion in favour of natural science. We believe the establishment of a travelling botanist in the king's service, if not suggested by the first-mentioned of these eminent men, was planned entirely under his advice and direction. In 1771 or 1772, Mr. Masson was dispatched to the Cape of Good Hope. That country had been, for near a century, celebrated as a mine of botanical riches, which had scarcely reached our gardens but through the medium of those of Holland. The works of Hermann, Commelin, Burmann, Breynius, and others, had sufficiently evinced the abundance of these treasures; but comparatively few of them had been procured in a living state, or cultivated with success, even by the Dutch themselves; and of those but a very small portion had, from the time of the first earl of Portland, when he came over with king William, to our days, come into general cultivation in England. The writer of this well recollects the pleasure which the novel sight of an African Geranium, in Yorkshire and Norfolk, gave him about forty years ago. Now every garret and cottage-window is filled with numerous species of that beautiful tribe, and every greenhouse glows with the innumerable bulbous plants and splendid heaths of the Cape. For all these we are principally indebted to Mr. Masson, besides a multitude of rarities, more difficult of preservation or propagation, confined to the more curious collections. Many of these perhaps have only survived to bloom once or twice within the walls to which they were first consigned; to be defined and named by the skill of a Solander, a Dryander, or of the younger Linnæus in his transient visit among us, and have then disappeared. Such has unavoidably been the case with many of the Orchis tribe, for want of our knowledge of their requisite treatment; while many of the *Liliacei* have flowered on their arrival, but though their bulbs have continued to exist, they have seemed rather to languish than to flourish, for want of their native arid soil and burning sun. Such deficiencies and disappointments indeed were scarcely felt while Mr. Masson continued at the Cape, so abundant and repeated were his supplies. The Dutch appear not to have restrained his inquiries or acquisitions. He was allowed to travel many hundred miles up the country, and we have often heard him recount his adventures. At length, his harvest having been judged, for the present, sufficiently abundant, he was, in 1776, ordered to explore the Canary islands, the Azores, Madeira, and part of the West Indies, especially the island of St. Christopher. In this mission he employed about five years more, and returned to England in 1781.

During his stay at the Cape, he entered into correspondence with the great Linnæus. Having discovered a bulbous plant of a new genus, he was not only laudably ambitious of botanical commemoration in its name, but he was particularly anxious, as appears by one of his letters, to receive this honour from no less a hand than that of his illustrious and venerable correspondent. This indeed was the "*unicum premium*," the only reward to which he aspired for all his labours. That he sought no pecuniary advancement, the extreme slenderness of the stipend which could be obtained for him, and his disregard of such objects at all times, abundantly evinced. He obtained the honour to which he aspired. The specimen of *Massonia* in the herbarium of Linnæus,

named by his own trembling hand near the close of his life, proves that the name had his sanction, though it appears from the *Supplementum Plantarum*, p. 27, to have been originally suggested by Thunberg, in whose company Masson botanized for two years at the Cape. This justice rendered to the merits of our botanical traveller, was finally crowned by the publication of plates of two species of *Maffonia*, in the *Hortus Kewensis* of his friend Aiton, a book which he had so eminently contributed to enrich, by his discoveries in various parts of the world. Before that book appeared however in 1789, he had, in 1783, visited Portugal and Madeira, and had returned to the Cape of Good Hope in 1786. He now combined experience and foresight with zeal and activity. He was prepared to take advantage of different seasons; in some to collect specimens, in others roots or seeds; so as best to make up for former deficiencies or losses; and he had already made himself acquainted with the various situations, or tracts of country, most promising for every purpose. In consequence of this knowledge, it was settled, in consultation with his able adviser, sir Joseph Banks, that his travels should now be restrained to within forty miles of the Cape town. That space of country was found to be as yet inexhausted, and almost perhaps inexhaustible, as to what it might afford for our gardens, and the expence as well as labour of the undertaking was, by this plan, greatly lessened.

Mr. Masson returned to England again in 1795, and spent two years there among his botanical friends, seeing the produce of his exertions every day blooming around him, at Kew and at Hammersmith, his residence at Kennington placing him within reach of the principal botanic gardens, as well as at a moderate distance from the great theatre of scientific and literary information in Soho square.

A life of so much leisure soon became irksome, to a man who had been used to so much bodily exertion, and mental recreation, amid the wild and novel scenes of nature, and he solicited another mission. This was obtained from his royal master, at the recommendation of his former friend and patron; and he was sent to explore such parts of North America, under the British government, as appeared most likely to produce new and valuable plants. This was truly a national project, worthy of those who planned it; the vegetable productions of that country, from the hardness of their constitution, being not merely objects of curiosity, taste, or luxury, but capable of being naturalized among us, for the probable benefit of our arts, our domestic and rural economy, our kitchen gardens and farms, as well as of our shrubberies and parterres. The success of our traveller was equal to the expectations that had been formed. New plants, of interesting characters and properties, sprung up under his steps, and it seemed probable that much practical knowledge was likely to result from his discoveries, even through the experience and converse of the wild inhabitants of those little explored regions. So others have found who have followed Mr. Masson; for he survived not to reap or to communicate more than a foretaste of these advantages. He died about Christmas, 1805, in the sixty-fifth year of his age, at Montreal, in Canada. What little property he left, fell into the hands of two of his nephews, and consisted chiefly of the journals of his various travels, drawings, and collections of dried plants or other natural productions. Some of these relics have been purchased by the present Mr. Lee of Hammersmith, a worthy friend of their original possessor. From him, or from our own personal knowledge, most of the above particulars are derived; the dates only being taken from the short mention of our deceased friend, communicated by the present Mr.

Aiton, to Sims and Konig's *Annals of Botany*, v. 2. 592. We cannot conclude better than in Mr. Lee's own words. "Masson was of a mild temper, persevering in his pursuits, even to a great enthusiasm. Of great industry; which his specimens and drawings of fish, animals, insects, plants, and views of the countries he passed through, evince. And though he passed a solitary life, in countries distant from society, his love of natural history never forsook him. Characters like him seem for the present dwindling in the world, but I trust they will revive. If a selection of his *memoranda* would be acceptable to the world, there is matter enough to carry it to a great extent."

Mr. Masson published, in 1796, a splendid work on the genus *Stapelia*, consisting of a thin folio volume, with forty-one coloured plates of as many species, almost entirely non-descript, accompanied by descriptions. This volume is dedicated to the king, in the same respectful and feeling style as the first edition of Mr. Aiton's *Hortus Kewensis*; and we think we perceive traces of the same able and judicious pen in both. S.

MASSONIA, in *Botany*, so called in honour of the late Mr. Francis Masson; see the preceding article. The younger Linnæus observes in his *Supplementum*, where the present genus was first published, that he was indebted to Mr. Masson for all the Canary plants described in that work.—Linn. Suppl. 27. Thunb. Nov. Gen. 39. Schreb. 216. Willd. Sp. Pl. v. 2. 28. Mart. Mill. Dict. v. 3. Ait. Hort. Kew. ed. 2. v. 2. 209. Juss. 53. Lamarck Illustr. t. 223.—Class and order, *Hexandria Monogynia*. Nat. Ord. *Spatheaceæ*, Linn. *Asphodeli*, Juss.

Gen. Ch. *Cal.* none. *Cor.* Petals six, inserted on the outside of the nectary, lanceolate, straight, spreading. Nectary inferior, cylindrical, membranous, of one leaf, with six streaks, and as many teeth. *Stam.* Filaments six, awl-shaped, incurved, equal, rather longer than the petals, inserted into the teeth of the nectary; anthers ovate, incumbent. *Pist.* Germen superior, three-lobed; style thread-shaped, curved; stigma nearly simple. *Peric.* Capsule triangular, smooth, of three cells and three valves, bursting at the angles, which are extended upwards into three short, rounded, erect wings. *Seeds* numerous, globose, somewhat angular, smooth.

Ess. Ch. Nectary inferior, tubular. Petals six, equal, inserted on the outside of the nectary. Capsule with three wings, three cells, and many seeds.

1. *M. latifolia*. Broad-leaved *Maffonia*. Linn. Suppl. 193. Ait. Hort. Kew. ed. 1. v. 1. 405. t. 3. Thunb. Nov. Gen. 40. Curt. Mag. t. 848.—Leaves nearly orbicular, depressed, perfectly smooth.—Native of the district of Roggefeldt, at the Cape of Good Hope, where it blossoms in September and October. In our greenhouses the flowers are produced in March and April. It was sent to Kew in 1775. The root is a round bulb. Stem none. Leaves two, radical, depressed, spreading widely on the ground in opposite directions, each from three to six inches long, nearly orbicular but somewhat pointed, entire, obscurely ribbed, fleshy, quite smooth; dark green above, with several purple spots towards the extremity; paler and spotless beneath. Flowers numerous, in a sessile radical head or tuft, between the leaves, each flower accompanied by an ovate leafy *bractea*, about equal to the nectary, or longer. The whole *corolla* is greenish, its petals deflexed. *Stamens* much longer than the petals, stout, purple, with yellow anthers.

2. *M. muricata*. Prickly-leaved *Maffonia*. Ker in Curt. Mag. t. 559.—Leaves nearly orbicular, depressed, prickly on the upper side towards the point.—Native of the Cape; introduced by Mr. Masson to Kew garden in 1790. It differs

fers from the last essentially in the prickles of the *leaves*. The *flowers* moreover are white in every part, except the anthers before they burst, and the very tumid rim of the *nectary*, which are of a blueish green. The *nectary* itself is described by Mr. Ker as brimful of honey, which surely justifies its Linnæan and Thunbergian appellation, though the ingenious author we have quoted, prefers calling it merely the tube of a monopetalous corolla. To us the petals in this genus, as in *Narcissus*, appear totally distinct in nature and substance, as they often are in colour, from the nectariferous tube.

3. *M. scabra*. Shagreen-leaved Massonia. Andr. Repof. t. 220. (*M. pustulata*; Jacq. Coll. v. 4. 177. Ker in Curt. Mag. t. 642. Redout. Liliac. t. 183.)—Leaves nearly orbicular, depressed, their upper side covered with prominent tubercles.—Sent by Mr. Masson from the Cape in 1790. It flowers here from January to April, and is said in the Bot. Mag. to be as easy of culture as any other Cape bulb. This species has the habit and size of the two preceding, but differs in having the whole upper surface of the *leaves* besprinkled with innumerable, small, prominent pustules, or tubercles. The *flowers* are of a greenish-white, the rim of the *nectary* being of a deeper green than the rest. The *bractæas* are broad, and closely laid over each other. *Stamens* and *style* tall, slender and white; the *stigma* minutely three-cleft, fringed.

4. *M. echinata*. Rough-leaved Massonia. Linn. Suppl. 193. Thunb. Nov. Gen. 41. Ait. n. 4.—Leaves ovate or lanceolate, depressed, their upper side covered with hairy tubercles. Petals very narrow.—Sent from the Cape by Mr. Masson in 1790. It seems not yet to have found its way, even once, into our periodical publications. It is said in the *Hortus Keewensis* to flower in May. Thunberg describes the *bulb* as scarcely so big as a hazle-nut. *Leaves* two, ovate, blunt with a point, smaller than any of the former, covered with prominent tubercles and white hairs.

5. *M. pauciflora*. Few-flowered Massonia. Ait. n. 5.—Leaves lanceolate or elliptical, veinless, covered with naked tubercles. Petals ovate.—Sent with the three last from the Cape, by Mr. Masson, in 1790. It is said to flower in May.

6. *M. angustifolia*. Narrow-upright-leaved Massonia. Linn. Suppl. 193. Ait. Hort. Kew. ed. 1. v. 1. 405. t. 4. Ker in Curt. Mag. t. 736. (*M. lanceolata*; Thunb. Nov. Gen. 40.)—Leaves oblong-lanceolate, ascending, smooth. Tube of the *nectary* long and cylindrical; mouth closed.—Found by Thunberg on the summit of the Onderste Roggefeldt mountain at the Cape, flowering in August, it being there a winter plant. This was sent over with the first species, by Mr. Masson, in 1775, and flowers here from January to April, increasing by offsets and seeds without difficulty. The *leaves* differ in their upright position from all the foregoing. They are smooth like *M. latifolia*, but much narrower, and not spotted. The *flowers* are fragrant like a hyacinth, white, with purple anthers, and a slender tube, twice or thrice as long as the petals, nearly closed at its mouth by the tumid bases of the filaments.

7. *M. undulata*. Waved-leaved Massonia. Thunb. Nov. Gen. 41. Ait. n. 7. Willd. n. 3.—Leaves upright, lanceolate, waved, smooth.—Found by Thunberg in the inland country above the Cape of Good Hope, and sent by Mr. Masson, in 1791, to Kew, where it flowers in April. *Bulb* the size of a hazle-nut. *Leaves* radical, three, four or five, very narrow in their lower part, lanceolate, waved, erect, about a finger's length. *Flowers* in a dense umbel, raised upon a common stalk, rather shorter than the foliage.

8. *M. ensifolia*. Trumpet-flowered Massonia. Ker in

Curt. Mag. t. 554. Ait. n. 8. (*M. violacea*; Andr. Repof. t. 46. *Maulhia ensifolia*; Thunb. Prod. 60. t. 3. *Agapanthus ensifolius*; Willd. Sp. Pl. v. 2. 48. *Polyanthes pygmæa*; ibid. 165. Jacq. Ic. Rar. t. 380.)—Leaves lanceolate, spreading, smooth. Tube of the *nectary* five times longer than the recurved petals, swelling gradually upwards, open-mouthed. Three *stamens* shorter than the rest.—Native of the Cape, where it was gathered by Thunberg and Masson, but introduced into this country by Mr. Williams of Turnham-Green, who is recorded to have raised it from Cape seeds in 1790 or 1791. It flowers from September to February. The *leaves* are two only, and most resemble those of *M. angustifolia*. The *flowers* grow in a rather dense, short-stalked cluster, and are of a pale lilac hue, very remarkable for their long, slender, gently-swelling tube or *nectary*, their minute *bractæas*, and unequal *stamens*. These circumstances, and the habit of the plant, have caused much difference of opinion respecting its proper genus, and Cavanilles, it seems, has made it a *Hyacinthus*, to which the good sense of Dr. Sims appears to have disposed him to assent, and we confess ourselves much of the same opinion. But Mr. Ker has thought otherwise, and he is followed by the editors of the Hort. Kew. Jacquin's excellent figure shews the capsule to be deficient in the dilatations or wings proper to *Massonia*, nor is there any line of distinction to be drawn between the *nectary* and petals; which Mr. Ker uses as an argument for considering the *nectary* and petals as one in the real *Massonia*, where they appear to us to be very distinct. We propose our doubts merely for the sake of truth, and by no means for controversy.

MASSONIA, in *Gardening*, comprises plants of the herbaceous bulbous-rooted flowery perennial kind, of which the species cultivated are, the broad-leaved Massonia (*M. latifolia*); and the narrow-leaved Massonia (*M. angustifolia*.)

Method of Culture.—These plants may be increased by planting the offsets from the roots, when the leaves drop off, in pots of sandy earth, plunging them in a hot-bed in the stove. And they are likewise capable of being raised from seeds, sown in pots of the same sort of earth, plunging them in a hot-bed in the house.

Afterwards the plants should have a free air in the greenhouse, where they must be kept.

They are capable of affording variety in these collections.

MASSORAH, in *Geography*, a town of Hindoostan, in Bahar; 23 miles E.S.E. of Bahar. N. lat. 53° 37'. E. long. 15° 5'.

MASSOUDI, in *Biography*, the surname of Aboul Hassan Ali, a celebrated Arabian geographer and historian, descended from Massoud Ebn Massoud, one of the most confidential friends of Mahomet, flourished in the tenth century. He was author of a work, entitled, according to our translation, "Golden Meadows and Mines of precious Stones," which he wrote in the year 336 of the Hegira. It is an historical and geographical treatise, comprised in two volumes: the first of which commences with the creation of the world, and comes down to the birth of Mahomet; and the second continues the history from that date to the author's time. He is author of another history, entitled "A Register of the Lands of Egypt." Other works are attributed to him, and, among these, the following is the principal: "A History of Insurgents at various Periods against lawful Authority, and particularly that of the Chaliphs." He died at Grand Cairo in Egypt, in the year 346 of the Hegira. There was another person of this name, who wrote a history of Syria and Damascus, entitled, according to the English version of it, "The Garden of Syria."

Syria," and a treatise "On the Conjugation of the Arabic Verbs."

MASSOW, in *Geography*, a town of Hinder Pomerania; 9 miles N. of Stargard.

MASSOWAH, MASUAH, or *Mafuah*, meaning, says Bruce, the port or harbour of the shepherds, a small island of the Red sea, near the coast of Abyssinia, in a bay, with an excellent harbour, governed by a chief called the Naybe of *Arkeeko*; which see. The water in the harbour is deep enough for ships of any size, which may ride in it secure from any wind. It was called by the Greeks "Sebasticum Os," from the capacity of its port, which is distributed into three divisions. The island itself is very small, scarcely three-quarters of a mile in length, and about half that in breadth: one-third occupied by houses; one by cisterns or tanks, of which there are about thirty, to receive the rain-water; and the last reserved for burying the dead. When Arabia Felix was conquered by the arms of Selim, emperor of Constantinople, Mafuah was a place of great commerce, possessing a share of the Indian trade, in common with the other ports of the Red sea near the mouth of the Indian ocean. Its exports were brought to it from an inhospitable and almost inaccessible mountainous country behind it: these consisted of gold and ivory, elephants' and buffaloes' hides, and, above all, slaves. Along its coast were found pearls, considerable for size, water, or colour. As long as commerce flourished, Mafuah continued to be a place of much resort; but it fell into obscurity very suddenly under the oppression of the Turks, who completed the ruin of the Indian trade in the Red sea, which had commenced some years before by the discovery of the Cape of Good Hope, and the settlements made by the Portuguese on the continent of India. The first government of Mafuah under the Turks was by a bashaw sent from Constantinople; but when it ceased to be a place of trade, it was not thought worth while to keep up the expensive establishment of a bashalik. In reward for the assistance given to the Turks, when they conquered this place, by a tribe of Mahometans called Belowce, shepherds inhabiting the coast of the Red sea, under the mountains of the Habah, about lat. 14°, the Turks gave their chief the civil government of Mafuah and its territory, under the title of Naybe of Mafuah; who held it, after the bashaw was withdrawn, of the grand signior, for an annual tribute, upon receiving a firman from the Ottoman Porte. The janizaries, established there as a garrison, intermarried with the women of the country; and in consequence of these intermarriages, Moors and natives of Mafuah became mutually related, and always subject to the influence of the Naybe. From motives of policy, it was agreed that one-half of the customs should be paid by the naybe to the king of Abyssinia. Having thus secured the friendship of Abyssinia, the naybe declined paying tribute to the bashaw of Jidda, to whose government he had been subjected by the porte; and he afterwards declined paying a share of the customs to the king of Abyssinia.

Mafuah was found by Mr. Bruce and his companions, as the result of various observations of the sun and stars, to be in N. lat. 15° 35' 5"; and by an observation of the second satellite of Jupiter, September 22, 1769, its longitude was fixed at 39° 36' 30" E. of Greenwich; the variation of the compass being 12° 48' W. As Loheia is nearly opposite, (N. lat. 15° 40' 52") the breadth of the Red sea between Mafuah and Loheia is 4° 10' 22"; and supposing a degree to be equal to 66 statute miles, this breadth, in round numbers, will be 276 miles. The height of the barometer, on the 4th of October, at 6 in the morning, was 25° 8' 2"; at 2 P.M., 25° 3' 2"; and half past 6 P.M., 25° 3' 7"; and

the greatest height of Fahrenheit's thermometer, viz. October 22, at 2 P.M., was 93°. Mafuah is very insalubrious, as is the whole coast of the Red sea from Suez to Babelmandeb, but more especially between the tropics, and subject to violent fevers, generally terminating in death on the third day. Fevers generally end in intermittents, and dysenteries, always tedious and often mortal. Another disease, endemial in this country, is called "hanzeer," the hogs or the swine, and is a swelling of the glands of the throat, and under the arms; and another complaint consists of small swellings all over the body, but thickest in the thighs, arms, and legs. Another disorder, common in these countries, is called "Farenteit," signifying the worm of Pharaoh, which afflicts those who are in the constant habit of drinking stagnant water. This plague appears indiscriminately in every part of the body, but most frequently in the legs and arms. This worm is seized by the natives gently by the head, and then wrapped round a thin piece of silk, or small bird's feather. Every day, or several times a day, they try to wind it upon the quill as far as it comes readily; and, upon the smallest resistance, they desist for fear of breaking it. When this operation, which sometimes lasts for three weeks, terminates, the hole or puncture discharges, by pressure, a small quantity of lymph; and in about three days it is healed without a scar. The elephantias is also one of the endemial diseases of the country.

At Mafuah it is a general custom for people to burn myrrh and incense in their houses, before they open the doors in the morning; and when they go out at night, or early in the day, they have always a small piece of rag highly fumigated with these two perfumes, which they stuff into each nostril, to keep them from the unwholesome air.

The houses in Mafuah are, in general, built of poles and bent grass, as in the towns of Arabia; but, besides these, there are about twenty of stone, six or eight of which are two stories each. At Mafuah all the necessaries of life are scarce and dear, and in quality indifferent. The same sort of money is in use at Mafuah and the opposite coast of Arabia. It is valued by the Venetian sequin: but glass beads, called "contaria," of all kinds and colours, perfect and broken, pass for small money, and are called, in their language, "Borjooke."

Table of the relative value of money.

Venetian sequin	=	2½ Pataka.
Pataka, or imperial dollar	=	28 Harf.
1 Harf	=	4 Diwani.
10 Kibeer	=	1 Diwani.
1 Kibeer	=	3 Borjooke or grains

The harf is likewise called dahab, meaning in Arabia gold, and frequently a sequin. The harf is 120 grains of beads.

The trade carried on at Mafuah is considerable, though the island is narrow and confined, and the government unjust and violent. The goods imported from the Arabian side are blue cotton, Surat cloths, and cochineal ditto, called Kermis, fine cloth from different markets in India; cotton unspun from ditto in bales; Venetian beads, crystal, drinking and looking-glasses; and kohol, or crude antimony. The three last articles come in great quantities from Cairo, first in the coffee-ships to Jidda, and then in small barks to this port. Old copper is also an article by which the gain is great, and a large quantity is imported. The Banians were once the principal merchants of Mafuah; but in Bruce's time they were reduced to fix. They are silver-smiths, that make ear-rings and other ornaments for the women on the continent, and are assayers of gold; but they make only a poor livelihood. As there is no water in Mafuah, the number

ber of animals belonging to it can be but small. Bruce's Travels, vol. iii.

MASSOWBA, a town of Congo; 10 miles N. of Bombi.

MASSUET RENÉ, in *Biography*, a learned French Benedictine of the congregation of St. Maur, was born at St. Owen de Maucellies, in the diocese of Evreux, in 1665. He became distinguished for his proficiency in ancient literature, particularly in the writings of the fathers and ecclesiastical antiquities. In 1710 he published a new edition of the works of St. Irenæus, in folio, more correct than any preceding editions, and accompanied with new notes and prefaces: he also added to it fragments of such pieces of Irenæus as are no longer extant; and prefixed to the whole are three dissertations, which reflect credit on his erudition, industry, and judgment. The first contains an account of the heretics against whom Irenæus wrote, and of their opinions; the second, a history of his own life, actions, and writings; and the third of his opinions. He was engaged after this, by his superiors, on a continuation of "The Lives of the Saints," and "The Annals of the Benedictine Order." He died in 1716, at the age of fifty. Möreri.

MASSURA, in *Geography*, a town of Hindooستان, in Bahar; 45 miles S.S.W. of Bahar.

MAST of a *Forsyth*, the fruit of that genus of trees called *glandiferous*, or *mast-bearing*; as beech, oak, chestnut, &c.

MAST, in *Ship Building*, a large pole, or long piece of round timber, raised in vessels, to which are attached the yards, sails, and rigging, in order to their receiving the wind necessary for navigation.

The word mast signifies the same thing in French, High-Dutch, Flemish, and English; the Italians use the word *albero*, and the Spaniards *mastil*.

Masts are long fir trees, or several fir trees coaked or douelled and bolted together, and cylindrically rounded a great part of their length, and, arching sideways, are similar to truncated cones.

Their number depends upon the size and nature of the vessel, some having three lower masts, which are called ships; some have two lower masts, such are brigs and snows; others only one mast, such are cutters, sloops, and other small trading-vessels. Besides the lower mast, each vessel has a bowsprit; and to complete the necessary heights of the masts, and convenience in many respects, there is attached to the head of the lower-mast, the top-mast, and to the head of the top-mast, the top-gallant-mast, and sometimes to the head of the top-gallant-mast, a small one, called a royal-mast. To these several masts are confined their respective yards and sails, and consequently the rigging for their support.

An attempt has been lately made to introduce four or more masts in vessels; but, upon a very liberal trial, it was found not to answer the purposes intended: for when the number of masts are multiplied, the yards must be shortened, or they would entangle each other in working. By this, too, the sails would be narrowed, and would receive too small a portion of wind for the force required. If, on the contrary, there is not a sufficient number of masts, the yards would be unmanageable, from their length. Experience, therefore, has proved, that, in large vessels, three lower-masts and a bowsprit, in smaller vessels, two lower-masts and a bowsprit, and in the smallest, one mast and a bowsprit, are the most advantageous number for nautical purposes.

All large masts, previous to the American war, were made of New England white pine, having been found the highest, and in all respects best suited to the purpose; but since then masts from Riga have been procured. As the largest trees from that country seldom exceed twenty-

four inches in diameter, and more frequently from nineteen to twenty-one, a much larger number of pieces was of course used in constructing made-masts. From this circumstance, and the nature of the wood being considerably heavier than white pine, the masts now in use exceed the former ones by nearly one quarter in weight: but Riga masts are considerably stronger than those of New England.

The choice of trees for making masts, yards, &c. to the best advantage, is of great importance; otherwise much unnecessary waste and expence must occur: and the greater number of trees any mast is composed of, the more judgment is required to suit each tree to the nearest size. The best method to attain this, is to draw upon a board or paper the several pieces the mast is composed of, similar to the *Plate of Masts*, &c. Every tree should be carefully examined whether it be sound, and should it be not quite straight, if sufficiently large, it might be made straight, in putting the mast together.

The best position, and indeed the heights of the masts, should be duly considered and ascertained by the constructor or ship-builder, as it is only the business of the mast-master to make them agreeable to the length or heights best suitable for the vessel to bear, of which the former is the best judge.

The lengths and diameter of the masts, &c. being given, the present mode of making a main-mast is as follows. For a ship of 74 guns:

From the butt set up the heights of the decks upon a straight line struck along the middle, and the given length, which is one hundred and eleven feet; from which set back six inches for every yard in the length, for the heading and stop, or rest for the treille-trees; five inches for the mizen-mast, which is the upper part of the hounds; from thence set back six-thirteenths of the length of the head for the length of the hounds; and from thence, to produce the curve sideways, set off the following diameters: and, first, the given diameter, which is thirty-seven inches, must be set off at the partners, which is at the middle-deck of three-deck ships, and the main deck of all others, and thirty-eight inches at the upper deck, in order to give the hoops a quicker drift; and this equally from a straight line along the middle: then divide the distance from the upper part of the hounds to the partners into four quarters or equal distances, terming that next the partners the first quarter, the next the second, and so on.

Then set off, as before, at the first quarter, thirty-six inches and three-eighths, or sixty-sixty-one parts of the given diameter; and at the second quarter thirty-four inches and three-quarters, or fifteen-sixteenths; at the third quarter thirty-two inches and a half, or seven-eighths; and at the lower part of the head, the thwart-ship way, thirty-two inches and a half, or seven-eighths; and the fore and aft-way twenty-seven inches and three-quarters, or three-fourths; and at the upper part of the head twenty-three inches and an eighth each way, or five-eighths of the given diameter. The interval from the lower deck to the heel is divided into two quarters, and the same dimensions set off as at the first and second quarters above; lastly, the heel is thirty-one inches and three-quarters, or six-sevenths of the given diameter.

Thus a curve passing through those several diameters would give the shape of the mast; and supposing it a single tree, it would only be made circular to those diameters. But large masts now, as before observed, are made of various smaller trees, united strongly together by douels, &c. and consist of a spindle, side-trees, fithes, &c. The spindle is made of one or two trees, douelled and bolted together. (See *Plate of Masts*.) Its length is five-sevenths the given length

of the mast; its breadth or siding two-thirds of the given diameters of the mast, if the trees designed will admit, if not three-fifths, and so continued to the hance of the side-fishes, which is at the middle of the hounds, and above that to the size of the mast at the head. The thwart-ship size of the spindle tapers from a middle line to half the diameter at the stop of the hounds, and is to hance in about three inches on each side, four feet below the butt of the side-trees, and from thence line straight to half the diameters of the mast at the second quarter, and tapers to half the size of the stop at the butt, and above the butt of the side-trees, the upper part tapers to one-sixth of the diameter at the head.

Side-trees.—Each side-tree is made of a single-tree, or two trees douelled and bolted together: they are sided to the size of the spindle the fore and aft-way. Their breadth athwart-ships, from the heel of the mast to the butt of the spindle, is one-half the diameter of the mast, and continues the same to the second quarter, deducting the substance of the spindle. At the third-quarter spindle included, the breadth is three-sevenths of the given diameter, and at the hance one-fourth of the breadth of the spindle at the stop of the hounds. Sometimes side-trees are assisted in their length by working heel-pieces, scarfed underneath at their lower ends. The scarfs of the heel-pieces should be one-half, or not less than one-third of their length. The side-trees are douelled and bolted to the spindle. The mast, thus far completed, is hewn square to its several diameters before-mentioned, and then eight-squared the thwart-ship way.

The *Side-fishes* are sawn from one tree cut down the middle, and one-fourth the diameter of the mast set off on each side for their thickness. The breadth of the fishes is two-thirds the diameter at the partners, and forty forty-one parts of that breadth at the first quarter, eleven-twelfths at the second, five-sixths at the third, and two-thirds at the upper end, and a parallel breadth from the partners to the heel, they are douelled, and fastened with dumps to the side-trees and spindle. All the surfaces being first well payed with tar, they are set close together.

When the spindle, side-trees, and side-fishes are douelled and bolted together, which is easier comprehended by frequently referring to the *Plate of Masts*, it is hewn square to its several diameters the fore and aft-way, then eight-squared, and any deficiencies in the angles made good by cant-pieces fayed therein; it is then sixteen-squared, and rounded and planed smooth from the heel to the hounds, except the surface left for douelling on the cheeks, where it is flattened for one-third their length. The mast, completed thus far, is hooped with iron, as shewn in the Plate.

The iron hoops are four inches and a half broad, and five-eighths of an inch thick, and the inner edges chamfered to prevent their bruising the mast.

Masts thus far finished are so sent to foreign ports, and hence called transportation masts.

Masts of a lesser size may be constructed of two trees, called the upper and lower tree, douelled together in the middle, and bolted: these trees give the diameter, fore and aft, and the upper part, for the reception of the cheeks, is formed as the one above; then, with the addition of the side-fishes, this mast may be so far completed as the former. Then to complete the mast, the

Cheeks must be added: they fashion the head of the mast, and leave a stop for the support of the trestle-trees. The length of the cheeks for a main-mast is nine-twentieths of the whole length of the mast; for the fore-mast three-sevenths, and for a mizen-mast two-fifths. The length for the head and hounds is agreeable to that first mentioned for the mast. The breadth of the cheeks at the head is

two-thirds of the given diameter of the mast, and three-fourths at the stop; and the lower part of the hounds, in the middle between the hounds and lower end, eleven-twelfths of the breadth at the hounds, and at the lower end one-half of the given diameter. The thickness of the cheeks is set off from the inside; thus the upper part above the stop to be one-fourth of the given diameter, and a stop left at the upper part of the hounds to project full half that thickness; the lower part of the hounds to be one inch more than the thickness at the upper part of the head, and from thence to line straight to five-ninths of the head at the lower end.

The cheeks are each made of a single tree, or two trees douelled together at the middle, and bolted; the inside of the cheeks is next fayed to the upper part of the spindle, to which they are douelled and bolted, and further secured by iron hoops; the upper hoop to be its breadth below the under side of the cap, another just clear of the trestle-trees, and four more equally between; and another hoop its breadth below the stop. Two bolts are to be driven under every hoop, six bolts in the hounds, and four more below; and the lower parts of the cheeks to be fastened with dumps and nails.

On the fore-side of the mast next below the check at the heel of the top-mast is a front fish fayed and fastened to the mast. (See the sections in the plate.) The whole is then strongly woodled together with twelve or thirteen turns of rope between every hoop. And to make a fair surface, filings of fir are fayed under the woodings next the edges of the front fish.

The *Trestle-trees* for sustaining the top, and confining the heel of the top-mast, are made of oak, in length one-fourth the length of their respective top-mast, deep half the given diameter of the lower-mast, and in thickness two-thirds of the depth, fayed and bolted to the lower part of the mast head, resting on the stop, as shewn in the plate.

The *Cross-trees* are oak, in length one-third the length of the top-mast deducting six inches, breadth what the trestle-trees are thick, and their depth two-thirds their breadth; the under sides are tapered from the ends one-fourth their length, and are framed together at right angles, as shewn in the plate.

Bibs or *Brackets* are made of elm, three to five inches in thickness; in length five-sixths the length of the hounds; and in breadth two-fifths of their length, fayed and bolted to the mast, under the trestle-trees for their support, as in the plate.

Bolsters are pieces of fir fayed on the trestle-trees, and against the sides of the mast, between the sid-hole and after-cross-tree, to project the trestle-trees one inch and a half, and the same in depth. The outer-sides are rounded for the shrouds to lay easy thereon.

The *Cap* is made of elm, in one or two pieces, douelled together in the middle: the length of the main-cap is four times the diameter of its top-mast, and three inches more; the breadth is half the length, and the depth half the breadth. Fore and mizen-caps are the same of their respective top-masts, adding two inches to the fore, and one inch only to the mizen. The cap is fixed on the mast-head by a square tenon; the mortise or square hole in the cap is made rather less than the tenon, to allow for its shrinking. Four eye-bolts are driven through the cap from the under-side, and well clenched on plates of one inch and three-quarters diameter, or less in proportion to the size of the cap, one on each side the square hole, and the other by the side of the round hole which is before the square hole, two-fifths of the diameter of the round hold, and half the tapering of the mast-head

head in its length. The size of the hole is the given diameter of its top-mast, and three-quarters of an inch more, as it is lined with leather.

Lastly, a tenon is made at the heel of the mast, by which it is fixed in the step: its size fore and aft is one-half the given diameter, and athwart-ships two-thirds, and of sufficient depth, as in the plate.

Masts made of single trees are finished in a similar manner, but having no cheeks the stop for the rest of the trestle-tree is made by the bibs or brackets. Merchant ships' masts are seldom woodded, but hooped only.

Top-masts have their several sizes or diameters set equally from a straight line along the middle of their length, which is for the 74-gun ships 66 feet. From the butt end set up once and a half the diameter, which is 20 inches, for the block below the heeling, and twice and a half the diameters above that for the heeling; and from the lower part of the said heeling, the length of the lower mast-head, or place of the cap, where the given diameter, 20 inches, is set off. Then from the whole length set back five inches for every yard in the length, for the length of the head and stop of the hounds, for main and fore-top-mast, and four inches for mizen-top-masts, and three-fifths that length below it for the hounds: then divide from the lower part of the head to the cap into four quarters; that next the cap is the first quarter; then set off, as before, 19 inches and five-eighths, or sixty sixty-ones of its given diameter; at the second quarter, 18 inches and five-eighths, or fourteen-fifteenths; at the third quarter, 17 inches and one-eighth, or six-sevenths; at the lower part of the hounds, 16 inches and one-quarter, or thirteen-sixteenths; at the stop, 18 inches, or nine-tenths; at the lower part of the head, 14 inches square, or seven-tenths; and at the upper part, 11 inches square, or five-ninths.

The aft-sides of top-masts are lined straight, the heeling to be square, and large enough, if the tree will admit, to fill up the trestle-trees at the lower mast-head, and to hance from the upper part to the diameter of the cap, and to be eight-square, or nearly so. The block below the heeling to be eight-square, and of the same size as the diameter at the cap, with an iron hoop driven on the heel. The stop above the hounds on the fore and after-sides to come up to the under-sides of the cross-trees; the hounds are left eight-square, and all below the hounds to the under-side of the main-ropes is to be smoothly rounded. Sheave-holes for the top-ropes are mortised through, one in the heeling, and one in the block below it; their length rather more than the depth, and their thickness two inches for every foot in length. A groove to bury the top-ropes is made in each angle, in the direction of the lower sheave-hole.

The sid-hole is a square mortise, cut through the middle of the heeling the size of the sid, which is in length once and a half the given diameter of the lower-mast, its depth one-third the given diameter of the top-mast, and its thickness two-thirds its depth, made of iron; but when made of wood, the depth is half the given diameter of its top-mast. A hole is made through one end for a laniard, and the other is snapped.

Top-mast trestle-trees: their length is three inches and a half to every yard in the length of their top-mast, in depth one inch and one-eighth to every foot in their length, and two-thirds their depth in thickness. Each cross-tree is one-third longer than the trestle-tree, their depth seven-eighths the depth of the trestle-tree, and are framed and bolted together as in the plate; with a sheave-hole mortised through the fore-end of the main, and two sheave-holes in each end of the fore-top-mast trestle-trees.

The top-mast cap is so similar to its topmast as the lower cap to its respective mast, that it needs only a reference to the plate.

Mizen-top-masts differ but little from the former: they have no block, but the heeling is set up from the butt, and, instead of a square head, have a long pole head about four times the length of the square head. They have a sheave-hole mortised through the hounds, fore and aft, for the top-sail-tye; and one a little above the stop, for the stay-sail-haliards; and one a little below the truck, for the mizen-top-gallant-tye.

Top-gallant-masts are made similar to mizen-top-masts: if to carry royal masts, the heads are square like a main-top-mast, but mostly made with pole-heads; if a stump pole-head, the same as a square head; if a common pole-head, its length is two-fifths the given length; and if a long pole-head, it is two-thirds the given length.

Royal masts are made similar to stump-head top-gallant-masts.

Bowspirts are rarely made of one tree, but are made of many, similar to made-masts: if made of two trees, they are fixed to two-thirds the diameter of the bowsprit the thwart-ship way, and each tree is one-half the diameter fore and aft, and douelled together in the middle, and bolted, and the deficiency made good athwart-ships by side-fishes; consequently each side-fish must be in thickness one-fourth the diameter, and are douelled and bolted to the sides, as may be readily seen in the mast-plate. Bowspirts made of single trees have a line straight along the middle, upon which set up the length from the butt, which is 68 for a 74-gun ship; next set off the bed, which is three-tenths of the length set up from the butt, and six inches added. Set back from the length four inches for every yard in the given length for the long square on the upper side, and one-third that for the short square on the under side; then from the bed to the outer end divide it equally into four parts, and that next the bed is the first quarter, and so on. At the bed set off equally from the middle line the given diameter, which is 35 inches; and at the first quarter, 34 inches and one-quarter, or sixty sixty-ones of the given diameter; at the second quarter, 32 inches and one-eighth, or eleven-twelfths; at the third quarter, 28 inches or four-fifths; at the outer end, 19 inches and a half, or five-ninths; and at the heel, 30 inches or six-sevenths. It is then lined to these diameters with a fair curve, and sawn square, then eight-squared, next sixteen-squared, and, lastly, rounded from the heel to the square at the outer end. At the heel is a tenon three-fifths the given diameter athwart-ships, and two-thirds up and down, tapering one inch in the length, which is one-third the given diameter.

The bowsprit-cap is made of elm, in length five diameters of the jib-boom, the breadth twice the diameter of the jib-boom, and half the diameter of the jack-staff, and the thickness four-ninths the breadth. In the lower part of the cap is a mortise to fix on the tenon at the outer end of the bowsprit, and a hole at two-sevenths the diameter of the bowsprit above it, for the jib-boom to slide through, leaving half the diameter of the jack-staff on the starboard side, where a groove is made to receive the same: bolts are then driven through the cap, as in the plate.

Bees are made of elm, about four inches thick, in breadth three-fifths of the given diameter of the bowsprit, and in length from the aft-side of the cap to the aft-part of the long square. They are let in, one on each side, one-third their thickness, into the bowsprit; their upper sides are kept flush with the upper side of the bowsprit, and the outer edges raised above the level three inches to every foot in breadth.

M A S T.

breadth, and are bolted through the bowsprit with four bolts. A block is fitted with a sheave-hole in each end, under each bee, as in the plate.

Saddles are pieces of elm fastened on the upper side of the bowsprit: that for the jib-boom is half the given diameter in length, and one-sixth in thickness, fixed at one-third the length of the jib-boom within the outer end. Saddles for the sprit-fail-flings are one-eighth the given diameter in thickness, and nails on the bowsprit at one-fifth the length within the outer end. A saddle to lead in the running-rigging is similar to the latter, having holes the size of the ropes bored through it, and nails on the bowsprit just before the gammoning.

Bowsprits of small vessels have an iron hoop with an eye on each side, and one on the upper side; it is let on and fastened at the outer end. A sheave-hole is cut through at the heel, and one at the outer end.

The *Jib-boom* is prolonged from the bowsprit, has a straight line struck along the middle of its length, which is 50 feet 6 inches for a 74-gun ship: one-third of that length is set up from the butt, and at that place set off 14 inches and a half, the given diameter; and from thence to the outward end divide into four equal parts, and at the first quarter set off 14 inches and one-eighth, or forty forty-ones of the given diameter; at the second quarter, 13 inches and one-quarter, or eleven-twelfths; at the third quarter, 12 inches and one-eighth, or five-sixths; and at the outer end, nine inches and three quarters, or two-thirds the given diameter. It is first squared to those diameters, then eight-squared: then set up from the heel three times and a half the given diameter, and from thence it is to be round to the outer end. Make a top at once and a half the diameter within the outer end, and cut a sheave-hole through from the upper side half its

length within the top, and another sheave-hole at once and a half the diameter from the heel, and through the middle of the starboard square, and a hole bored through between that and the heel, as in the plate.

Masts of wrought-iron have lately been proposed thus: the cylinder to be half an inch thick, and the same height and diameter as the fir mast, will not be so heavy, will be considerably stronger, much more durable, less liable to be injured by shot, and be easily repaired even at sea. It will weigh only 12 tons, and, at 45*l.* per ton, will not cost more than 540*l.*; while its strength will be nearly 50 per cent. above that of a fir mast, that weighs 23 tons, and costs nearly 1200*l.* This mast is made to strike nearly as low as the deck, to ease the ship in a heavy sea. Ships furnished with fir masts are, in such circumstances, obliged to cut them away. Ships furnished with iron masts will not, like others, be exposed to the risk of receiving damage from lightning; the iron mast of itself being an excellent conductor. By using an iron bolt from the heel of the mast, through the keelson and keel, the electric matter will be conducted through the bottom of the ship into the water, without injury to the ship. Bowsprits and yards may also be made of wrought-iron, at the same proportion of strength and expence as the mast.

Masts and yards, particularly the latter, by a patent of Mr. Smart's, were proposed to be made hollow, of wood somewhat similar to the staves of a cask.

Gordon, in his Naval Architecture, has recommended masts to be made in a curious manner of several small trees to be united together by a sort of brackets at certain distances. The former have been actually tried, but their not coming more into practice seems to make against their utility.

Dimensions of Masts, Yards, &c. for the Plates of a 74-Gun Ship, Frigate of 40 Guns, and East-India Ship of 1300 Tons. See SHIP-BUILDING.

Main-booms	6 3	1 4	7	4 1/2	5 1/2	6 7
	6 3	1 4	7	4 1/2	5 1/2	

By the above tables of lengths and diameters of masts, yards, &c. may be easily ascertained the relative lengths they bear to each other, and their diameter in inches to their respective yards in length.

The length of the main-mast, in most ships, is governed by the length and breadth of the ship. Thus; let the length at the load-water line from the rabbit to the stern to the rabbit of the stern-post be added to the extreme breadth, and half that sum is the length of the main-mast. But for very sharp-bodied ships take seventeen-twentieths of the above sum for the length of the main-mast. Then for the length of the fore-mast take nine-tenths of the main-mast, and in some ships full that. For the bow-sprit take three-fifths of the main-mast, and in some ships more, and so on of the others, as may be seen by inspecting the table.

MAST, *Armed*, one that is made of more than one tree.

MAST *Carlings*, are large square pieces of oak timber placed into the beams at the sides of the mast rooms, for the purpose of framing the partners.

MAST, *Heel of a*. See HEEL.

MAST, *Jury*. See JURY.

MAST *Rooms*, the spaces between those beams where the masts are fixed.

MAST, *Spending a*, at *Sea*, is when it is broke by foul weather.

MAST, *Springing a*, is when it is cracked in any place.

MAST *Bay*, in *Geography*, a bay on the N. side of the island of Jamaica; E. of Montego bay and near Catlin's cliffs.

MAST *Island*, a small island in the Indian sea, near the coast of Africa. S. lat. 11° 28'.

MASTS, in *Rural Economy*, a provincial term applied to acorns in some districts, but improperly. It is sometimes pronounced *mesf*.

MASTA, in *Geography*, a small island in the Adriatic. N. lat. 44° 7'. E. long. 15° 23'.

MASTAI, a town of Japan, on the S. coast of Nippon; 10 miles S.W. of Meaco. N. lat. 34° 46'. E. long. 134° 30'.

MASTASA, a town of Fez; 40 miles W.N.W. of Velez de Gomera.

MASTASSIN LAKE, a lake of North America, at the head of Rupert's river, which falls into James's bay; it is about 200 miles in circuit, and intersected by projections of land.

MASTED. A ship is said to be masted, when she has all her masts complete.

MASTED, *Over*, or *Tautn-masted*, is said of a ship whose masts

are either too long or too big; which makes her lie too much down by the wind, and labour too much *a-hull*.

MASTED, *Under*, or low-masted ships, such whose masts are either too small, or too short; in which case she cannot bear so great a sail as should give her true way.

MASTER, a title given to several officers and persons of authority and command; particularly to the chiefs of the orders of knighthood, &c.

Thus we say, the grand-master of Malta; of St. Lazarus; of the Golden Fleece; of the Free Masons, &c.

MASTER, *Magister*, was a title frequent among the Romans; they had their master of the people, *magister populi*, who was the dictator. Master of the cavalry, *magister equitum*, who held the second post in an army, after the dictator. Under the later emperors there were also masters of the infantry, *magistri peditum*. A master of the census, *magister census*, who had nothing of the charge of a censor, or sub-censor, as the names seem to intimate; but was the same with the *prepositus frumentariorum*.

MASTER of the *Militia*, *magister militia*, was an officer in the lower empire, created, as it is said, by Dioclesian, who had the inspection and government of all the forces, with power to punish; &c. somewhat like a constable of France.

At first there were two of these officers instituted, the one for the infantry, and the other for the cavalry; but the two were united into one under Constantine. Afterwards, as their power was increased, so was their number also; and there was one appointed for the court, another for Thrace, another for the East, and another for Illyria. They were afterwards called *comites*, *counts*, and *clarissimi*. Their power was only a branch of that of the *praefectus praetorii*, who by that means became a civil officer.

MASTER of *Arms*, *magister armorum*, was an officer, or comptroller under the master of the militia.

MASTER of the *Offices*, *magister officiorum*, had the superintendance of all the officers of the court; he was also called *magister officii palatini*; simply *magister*; and his post *magisteria*.

This officer was the same in the western empire, with the *curiales* in the eastern.

MASTER, in the Roman history and laws, is used for every officer who is the chief of his kind; and has others of the same species, or that have the same functions, under him. In Latin, *magister*, and oftentimes *proximus*, or *primicerius*.

MASTER of the *Armory*, is an officer who has the care and oversight of his majesty's arms and armory.

MASTER at *Arms*, is an officer appointed to teach the officers

officers and crew of a ship of war the exercise of small arms; to confine and plant centinels over the prisoners, and superintend whatever relates to them during their confinement. He is also to observe that the fire and lights are all extinguished as soon as the evening-gun is fired, except those which are permitted by proper authority, or under the inspection of the centinels. It is likewise his duty to attend the gangway, when any boats arrive aboard, and search them carefully, together with their rowers, that no spirituous liquor may be conveyed into the ship, unless by permission of the commanding officer. In these several duties he is assisted by proper attendants, called his corporals, who all relieve the centinels, and one another, at certain periods. *Falconer.*

MASTER of Arts, the first degree taken up in foreign universities, but the second in ours; candidates not being admitted to it till they have studied in the university seven years. See *DEGREE*.

MASTER-Attendant, is an officer in the royal dock-yards, appointed to halter, and assist at, the fitting out or dismantling, removing, or securing vessels of war, &c. at the port where he resides. He is particularly to observe that his majesty's ships are securely moored, and for this purpose he is expected frequently to review the moorings, which are sunk in the harbour, and observe that they are kept in proper repair. It is also his duty to visit all the ships in ordinary, and see that they are frequently cleaned and kept in order; and to attend at the general musters in the dock-yards, taking care that all the officers, artificers, and labourers, registered at the navy-books, are present at their duty. *Falconer.*

MASTER, Barrack. See *BARRACK*.

MASTER of the Ceremonies, an officer instituted by king James I. for the more solemn and honourable reception of ambassadors, and strangers of quality, whom he introduces into the presence.

The badge of this office is a gold chain and medal, having on one side an emblem of peace, with king James's motto; and on the reverse the emblem of war, with *Dieu & mon droit*. He is always supposed to be a person of good address, and master of languages, and has an appointment of 300*l.* a-year: he is constantly attending at court, and hath under him an assistant master or deputy, at 6*l.* 8*d.* a day; who holds his place during the king's pleasure.

There is also a third officer, called *marshal of the ceremonies*, with 100*l.* a-year, whose business is to receive and distribute the master's orders, or the deputy's, for the service: but, without their order, he can do nothing. This is the king's gift.

MASTERS of Chancery are usually chosen out of the barristers of the common law; and sit in chancery, or at the rolls, as assistants to the lord chancellor, and master of the rolls. All these, so late as the reign of queen Elizabeth, were commonly doctors of the civil law.

To them are also committed interlocutory reports, examination of bills in chancery, stating of accounts, taxing costs, &c. and sometimes, by way of reference, they are empowered to make a final determination of causes.

They have, time out of mind, had the honour to sit in the lords' house, though they have neither writs, nor patent to empower them; but they are received as assistants to the lord chancellor, and master of the rolls. They had anciently the care of inspecting all writs of summons, which is now performed by the clerk of the petty-bag. When any message is sent from the lords to the commons, it is carried by the masters of chancery. Before them also affidavits are made, and deeds and recognizances acknowledged. See *CHANCELLOR* and *COURT of Chancery*.

Besides these, who may be called masters of chancery *ordinary* (being twelve in number, whereof the master of the rolls is reputed the chief), there are also masters of chancery *extraordinary*, appointed to act in the several counties of England beyond ten miles distance from London, by taking affidavits, recognizances, &c. for the ease of the suitors of the court.

MASTER of the Faculties, an officer under the archbishop of Canterbury, who grants licenses and dispensations: he is mentioned in the statute 22 & 23 Car. II. See *COURT of Faculties*.

MASTER-Gunner of England. See *GUNNER*.

MASTER of the Horse, a great officer of the crown, to whom is committed the charge of ordering and disposing all matters relating to the king's stables, races, and breed of horses, with a salary of 1266*l.* 13*s.* 4*d.* a-year.

He hath a power of commanding the equerries, and all the other officers and tradesmen employed in the king's stables; to all which he gives by his warrant to the avenor, the oath of allegiance, &c. for the faithful discharge of their duty. He has the peculiar privilege of making use of any horses, pages, or footmen, belonging to the king's stables; so that his coaches, horses, and attendants are the king's, and have the king's arms and liveries.

There is also a master of the horse in the establishment of her majesty's household, with a salary of 800*l.* a-year.

MASTER of the Household is an officer under the lord steward of the household, in the king's gift; his business is to survey the accounts of the household. His salary is 500*l.* a-year.

Anciently the lord steward himself was called *grand-master of the household*.

MASTER of the Jewel Office, is an officer of the king's household, who has the charge of the gold and silver plate used at the king's table, or at that of any officer attending the court, and of all plate remaining in the Tower of London; as also of chains and loose jewels not fixed to any garment. See *JEWEL-Office*.

MASTER of the Mint, was anciently the title of him who is now called *warden of the mint*; whose office is to receive the silver and bullion which comes to the mint to be coined, and to take care thereof.

The office of master and worker is now distinct; and this officer is allowed for himself 3000*l.* a-year, and for three clerks 205*l.* each. There is also the king's assay-master, allowed for himself and clerk 425*l.* a-year: and the master's assay-master, with a salary for himself and foreman of 125*l.* a-year.

MASTER of the Ordnance. See *ORDNANCE*.

MASTER of the Revels, an officer with an appointment of 100*l.* a-year, whose business is to order all things relating to the performance of plays, masques, balls, &c. at court. Formerly he had also a jurisdiction of granting licences to all who travel to act plays, puppet-shows, or the like diversions; neither could any new play be acted at either of the two houses till they had passed his perusal and licence; but these powers were afterwards much abridged, not to say annihilated, by a statute for regulating playhouses, till the licensing plays by the lord chamberlain was established. This officer was a yeoman, with 46*l.* 11*s.* 8*d.* per annum.

MASTER of the Robes. See *ROBES*.

MASTER of the Rolls, a patent officer for life; who has the custody of the rolls and patents which pass the great seal; and of the records of the chancery.

In the absence of the lord chancellor, or keeper, he also sits as judge in the court of chancery; and is, by sir Edward Coke, called *his assistant*.

At other times he hears causes in the rolls-chapel, and makes orders and decrees. He is also the first of the masters

of chancery, and hath their assistance at the rolls: but all hearings before him are appealable to the lord chancellor.

He hath also his writ of summons to parliament, and sits next to the lord chief justice of England, on the second wool-pack: he hath the keeping of the parliament-rolls, and has the rolls-house for his habitation; as also the custody of all charters, patents, commissions, deeds, and recognizances, which being made of rolls of parchment, gave rise to the name. Anciently he was called *clerk of the rolls*.

Concerning the authority of the master of the rolls to hear and determine causes, and his general power in the court of chancery, there were (not many years since) divers questions and disputes very warmly agitated; to quiet which, it was declared by stat. 3 Geo. II. cap. 30. that all orders and decrees by him made, except such as by the course of the court were appropriated to the great seal alone, should be deemed to be valid; subject nevertheless to be discharged or altered by the lord chancellor, and so as they shall not be inrolled, till the same are signed by his lordship. Blackst. Com. vol. iii.

In his gift are the six clerks in chancery, the examiners, three clerks of the petty-bag, and the six clerks of the rolls-chapel, where the rolls are kept. See ROLLS, CLERK, &c.

MASTER of a Ship, an officer to whom is committed the direction of a merchant vessel, who commands it in chief, and is charged with the merchandizes abroad.

In the Mediterranean the master is frequently called *patron*, and in long voyages *captain*.

It is the proprietor of the vessel that appoints the master, and it is the master who provides the equipage, hires the pilots, sailors, &c. The master is obliged to keep a register of the seamen and officers, the terms of their contract, the receipts and payments, and, in general, of every thing relating to his commission.

MASTER of a Ship of War, is an officer appointed by the commissioners of the navy, to take charge of navigating a ship from port to port, under the direction of the captain. The management and disposition of the sails, the working of a ship into her station in the order of battle, and the direction of her movements in the time of action, and in other circumstances of danger, are also more particularly under his inspection. It is likewise his duty to examine the provisions, and accordingly to admit none into the ship but such as are found sweet, and wholesome. He is moreover charged with the stowage; and for the performance of these services, he is allowed several assistants, who are properly termed *mates* and *quarter-masters*.

MASTER of the Temple. The founder of the order of the Templars, and all his successors, were called *magni templi magistri*; and ever since the dissolution of the order, the spiritual guide and director of the house is called by that name. See TEMPLE and TEMPLAR.

MASTER or Keeper of the Wardrobe, an officer in the lord chamberlain's department, who has the direction of all the royal robes, as those of the coronation, St. George's feast, and the parliament-robes; as well as of the wearing apparel, collar of SS's, George and Garter, &c.

He has also the charge and custody of all former kings' and queens' robes, remaining in the Tower; all hangings, bedding, &c. for the king's house; and the charge and delivery of velvet and scarlet allowed for liveries.

He has under him a groom and two clerks, a yeoman, &c. See WARDROBE.

There are also several other officers under this denomination, as the master and conductor of the band of music, whose salary is 300*l.* a-year; master of mechanics, with a salary of 200*l.* a-year; master of the tennis-court, with a

salary of 132*l.* a-year; master of the barges, with 100*l.* a-year; master of the harriers, with 2000*l.* a-year; master of the buck-hounds, with 2341*l.* a-year; master of the stag-hounds, with 2000*l.* a-year; master-falconer, with 210*l.* a-year, &c.

MASTER, Burgher. See BURGHER.

MASTERS, Burgher. See BURGHERMASTERS.

MASTER, Fire. See FIRE.

MASTER, Quarter. See QUARTER.

MASTER-arch. See ARCH.

MASTER Load, in Mining, a term used to express the larger vein of a metal, in places where there are several veins in the same hill. See LODE.

MASTER-piece, an exquisite, or extraordinary work, or performance, in any art or science.

MASTER-piece, chef d'œuvre, is particularly used among the French, for a work which those who aspire to be admitted master of any art or trade, are to perform in presence of the masters, or jurands, of that company, by way of a specimen of their capacity.

MASTER-vault. See VAULT.

MASTER-wort, in Botany. See IMPERATORIA.

MASTER-wort, Black. See ASTRANTIA.

MASTER-yaw, a large yaw, sometimes remaining after salivation. See YAWS.

MASTICA de Sobo, in the *Materia Medica*, the name given by the Indians to the stone commonly known among authors by the name of *pedro del porco*, a sort of bezoar taken out of the gall-bladder of an Indian boar. The Indians, and many of the European nations, esteem this one of the greatest medicines in the world in pestilential diseases, and the small-pox.

MASTICATION, in Physiology, is the operation of chewing, in which, by the motion of the jaws and teeth, the food is brought into a state in which it can be swallowed. The action of the teeth comminutes the harder kinds of food, and the fluids, poured into the mouth from the salivary glands, by their admixture, soften the food thus comminuted. This process, and the instruments concerned in its performance, are described in the article DEGLUTITION.

MASTICATORIES, MASTICATORIA, in Medicine, are such remedies as are taken in at the mouth, and chewed in order to promote the evacuation of the salival humour: as tobacco, ginger, pepper, sage, rosemary, thyme, mastic, &c.

MASTICH. See CALCAREOUS CEMENT.

MASTICH-Tree, Turpentine-tree, or Pistachia-nut-tree, in Botany. See PISTACHIA LENTISCUUS.

MASTICH, in the Materia Medica, a resinous substance that is obtained from the Pistachia lentiscus, which is a native of the south of Europe and the Levant, and which appears by Evelyn's Kalendarium Hortense to have been cultivated in Britain in 1666. It is obtained, most abundantly, according to Tournefort, by making transverse incisions in the bark of the tree about the beginning of August, from which the mastic resin, or gum, exudes in drops, which running down and concreting on the ground, are thence collected for use. The time chosen for making these incisions is the first of August, when the weather is very dry: in the following day the mastic begins to appear in drops, which continue to exude till the latter end of September. The tree is raised also in several parts of Europe; but no resin has been observed to issue from it in these climates. It has its name mastic, from *masficare, to chew*, because it is thus used in Scio, and by the Turks, especially the women, for sweetening the breath, and strengthening the gums and teeth: and by producing a copious excretion

cretion of saliva, it proves serviceable in catarrhus disorders.

According to Olivier, (Travels in the Ottoman Empire,) mastich is gathered in 21 villages of the island of Scio; and the incisions, he says, are made from the 15th to the 20th of July, according to the Greek calendar. Cloths are frequently placed under the tree, so that the mastich which trickles from it may not be impregnated with earth and filth. By the regulations made in the island, the first gathering cannot take place before the 27th of August. It lasts eight successive days, after which fresh incisions are made in the trees till the 25th of September, and then the second gathering is made, which likewise lasts eight days. After this time the trees are cut no more, but the mastich which continues to run is gathered till the 19th of November on the Monday and Tuesday of every week. It is afterwards forbidden to gather this production. This production in the 21 villages of Scio, amounts, one year with another, to 50,000 oke, and even more. Twenty-one thousand belong to the aga who farms this commodity, and are delivered by the cultivators in payment of their personal impost. They are paid for the surplus at the rate of 50 parats per oke (nearly 16 sous the pound), and they are prohibited, under very severe penalties, from selling or disposing of it to any other than the aga who farms it. That of the best and finest quality is sent to Constantinople, for the palace of the grand signior. That of the second quality is intended for Cairo, and passes into the harems of the Mamalukes. The merchants generally obtain a mixture of the second and third quality.

This resinous substance is brought to us in small yellowish transparent brittle grains or tears. A piece recently broken is quite transparent, but by exposure to the air it becomes superficially somewhat pulverulent, and hence semitransparent. Its specific gravity is 1.074. By digestion with alcohol it is separated into two portions; the one soluble in this fluid, and the other insoluble: the former composes about $\frac{2}{3}$ ths of the whole, and is pure resin; the latter in most of its properties closely resembles caoutchouc. The presence of this substance in mastich was first remarked by Kunde, an apothecary of Berlin, whose observations have since been confirmed by Mr. Matthews. After solution of the resin in alcohol an inflammable residue is left behind of a white colour, considerably elastic and adhesive; when heated it becomes brown, emitting an inflammable gas, and in this state greatly resembles common caoutchouc, except in being slightly glutinous. It is perfectly soluble in washed sulphuric ether, from which it is precipitable by alcohol in the form of a white curd. It is wholly insoluble in water. By digestion with nitric acid it is converted into a yellow brittle porous mass, nitrous gas being at the same time given out; it is charred by sulphuric acid, to which it communicates a deep (somewhat muddy) crimson colour, with the evolution of sulphureous acid. Neither the muriatic nor oxymuriatic acids, nor the alkalis, whether caustic or carbonated, have any action on it: in all which particulars it agrees with caoutchouc.

It has a light agreeable smell, especially when rubbed or heated. It is almost totally soluble in spirit of wine, yielding a solution of a pale yellow colour, but not at all in water. Distilled with water, it yields a small proportion of a limpid essential oil, in smell very fragrant, and in taste moderately pungent. Rectified spirit also brings over in distillation the more volatile odorous matter of the mastich. It becomes soft and tough like wax, by being chewed. Mastich is recommended in doses from half a scruple to half a drachm, as a mild corroborant and astringent, in old coughs, hæmoptyses, diarrhœas, weakness of the stomach, &c. It is given either in substance, divided by other materials; or dissolved in spirit and mixed with syrups; or

dissolved in water into an emulsion, by the intervention of gum arabic or almonds. It is also an ingredient in varnishes. See VARNISH.

The jewellers mix mastich with turpentine and ivory black, and lay it under their diamonds, to give them a lustre.

The *Lentisci lignum*, or wood of this tree, is received into the *Materia Medica* of some of the foreign pharmacopœias, and is highly extolled in dyspeptic, gouty, hæmorrhagic, and dysenteric affections. Lewis. Woodville.

The Arabian writers, Avicenna and Serapion, in their chapters of the turpentine-tree, often mention the lentisk and its resin, which they say was very much like the resin of the common turpentine-tree. But besides this, Avicenna has a peculiar chapter on mastich; whence it should seem, that by the name lentisk they do not mean the tree which produces mastich, but some peculiar species of the turpentine-tree.

Avicenna distinguishes two kinds of mastich, the one called *rumi*, and the other *cupiti*: the *rumi* came from the island of Scio, and was white; the *cupiti* was of a blackish colour, and brought from Egypt.

MASTICH *Herb*, *master-thyme*, *marum vulgare*, in *Botany*, a name given to one of the species of *Thymus*; which see.

It is a plant that grows naturally in Spain, in dry gravelly grounds, and in the like soils bears the ordinary winters of our climate. It flowers in June, and its flowers are small, white, and standing in hairy brittle empalements: the whole plant has a grateful odour.

This plant is employed chiefly, like the Syrian mastich, as an errhine. It is considerably pungent, though less so than the other.

MASTICH, *Indian*. See *SCHINUS*.

A decoction of the bark of this tree makes a fomentation of extraordinary efficacy in pains of the legs, and inflations. Of the small branches are made serviceable tooth-picks. Of the fruit boiled in water, according to the measure of the decoction, they prepare either a wine, a very good sort of drink, vinegar, or honey. A decoction of the leaves gives relief in pains proceeding from cold causes. Raii Hist. Plant.

MASTICH, *Syrian herb*, *marum Syriacum*, is a species of *Teucrium*; which see.

MASTICH, *Syrian herb*, in the *Materia Medica*. See *GERMANDER*.

MASTICHE TERRA, *maslich earth*, a name given by some of the old writers on the *materia medica* to the Chio or Scio earth, or *terra Chia*. The reason of this strange appellation seems to have been, that the finest mastich coming from the island of Chio, had obtained the name of *Kie*, or *Chie*, and *maslich* and *Chia* being thus become, in one sense, synonymous words, the use of them was, in this manner, carried much farther, and the earth of that island called by the name of the *gum*.

The Arabians seem to explain this very well, in their name of this earth; they not calling it *maslich earth*, but *thin beled almastichi*, that is, *terra regionis mastichis*, the earth of the country where mastich is produced.

MASTICOT, MASSICOT, or *Yellow Lead*, is the yellow oxyd of lead. (See *LEAD*.) It is sometimes used by painters, and it serves medicinally as a drier in the composition of ointments or plasters.

The masticot which is used by the Dutch as the ground of their glazing, is prepared by calcining a mixture of one hundred weight of clean sand, forty-four pounds of soda, fold

fold with us under the name of barilla, and thirty pounds of pearl-ashes.

MASTIFF-DOG, or *Band-dog*, *villaticus*, or *catenarius*, is a species of great size and strength, and a very loud barker. Manwood says, that it derives its name from *mase thefese*, being supposed to frighten away robbers by its tremendous voice. Great Britain was formerly so noted for its mastiffs, that the Roman emperors appointed an officer in this island with the title of *Procurator Cynegetii*, whose sole business was to breed and transmit from hence to the amphitheatre, such as would prove equal to the combats of the place. Strabo, lib. iv. tells us, that the mastiffs of Britain were trained for war, and used by the Gauls in their battles. See **DOG**.

MASTIGADOUR, or **SLABBERING-BIT**, in the *Manege*, is a snaffle of iron, all smooth, and of a piece, guarded with pater nozzers, and composed of three halves of great rings, made into demi-ovals of unequal bigness, the lesser being inclosed within the greatest, which ought to be about half a foot high. A mastigadour is mounted with a head-stall and two reins. A horse by champing upon the mastigadour, keeps his mouth fresh and moist.

To put a horse to the mastigadour, is to set his croup to the manger, and his head between two pillars in the stable. Horses that use to hang out their tongues cannot do it when the mastigadour is on; for that keeps their tongue so much in subjection, that they cannot put it out.

MASTIGON, in *Geography*, a river of North America, which runs westward into lake Michigan, about 11 miles N. of La Grande Rivière. At its mouth it is 150 yards wide.

MASTIGOPHORI, *Μαστιγοφοροι*, among the Greeks, certain officers appointed to preserve the peace, and correct such as were disorderly at the Olympic games.

MASTIH, in *Geography*, a town of Persia, in the province of Kerman; 140 miles E.N.E. of Sirgian. N. lat. 29° 16'. E. long. 59 40'.

MASTOIDES, **MASTOIDEUS**, *Mastoid*, in *Anatomy*, epithets applied to a certain process of the temporal bone, and to parts situated near, or connected with, it. In old writers, the bone altogether is sometimes called os mastoides. The large nipple-like process of the bone, behind the ear, is always distinguished by that name; and the portion of the bone including it is called the mastoid portion. (See **CRAanium**.) The cells by which it is excavated, are the mastoid cells. Mastoideus is the name given by Albinus and others to part of the muscle described in this work under the article **STERNO-CLEIDO-MASTOIDEUS**.

MASTRE, **LA**, in *Geography*, a town of France, in the department of the Audeche, and chief place of a canton, in the district of Tournon; 15 miles N. of Privas. The place contains 2090, and the canton 11,873 inhabitants, on a territory of 170 kilometres, in nine communes.

MASTURA, a town of Arabia Petrea, on the borders of the Red sea; 92 miles S.W. of Medina. N. lat. 23° 5'.

MASVAUX, a town of France, in the department of the Upper Rhine, and chief place of a canton, in the district of Befort; nine miles N. of Befort. The place contains 2181, and the canton 9404 inhabitants, on a territory of 192½ kilometres, in 18 communes.

MASUCO, or **MASACON**, a town of Portugal, in the province of Tras los Montes; 27 miles S.S.W. of Miranda de Duero.

MASULA, a town of Persia, in the province of Ghilan; 40 miles N.N.W. of Aitara.

MASULIPATAM, a city and sea-port of Hindoostan, in the circar of Condapilly, near the mouth of the Kistna river, within the district named "Mesolia" by Ptolemy.

This is a place of considerable trade for chintzes and printed linens. The air is deemed unwholesome; 65 miles S.S.W. of Rajamundry. N. lat. 16° 8' 30". E. long. 81° 12'.

MASURIEH, a town of the Arabian Irak, on the Euphrates; 50 miles W. of Korna.

MASZOW, a town of Hungary; six miles W. of Rosenberg.

MAT, in *Agriculture*, a sort of covering material, prepared by weaving bafs or other substances of the same sort together. They are mostly brought into this country with different sorts of packages. Mats about Sandwich and Dover are stated by Mr. Young to be made use of for covering the shocks of wheat; by which practice, Mr. Boys assures him, the sample of wheat is improved, so as that the Dover bakers give a decided preference to it. The mats cost about seven-pence each. They are too expensive for general use.

MAT, *Garden*, a kind of coarse mat or covering formed of bafs, which is much used in gardening, for sheltering various sorts of plants in winter and spring, in frosty and other cold weather; and in summer for shading many sorts of young or tender kinds occasionally from the sun; and many other purposes in the different garden departments. They are found to differ greatly in regard to size and substance, there being small, middling, and large sizes; but for general use, those called Russia mats are superior, both in dimensions, substance, and durability. It may also be proper to have some of the smaller or middling sizes for particular occasions, and small gardens, in which, for some purposes, they may be more convenient than large ones. They were formerly sold by most of the principal nursery and seedmen, at from about six or eight to twelve or fifteen shillings the dozen, according to size and strength, but for some years past the prices have been much higher.

These mats are also of essential use in all hot-bed works, for covering or spreading over the lights or glasses of the frames in the nights, in winter and spring, to exclude the external night cold; also occasionally in the day time in very severe weather, and heavy falls of snow or rain. And likewise for occasionally covering several sorts of small young esculent plants in the full ground in beds and borders, in these seasons; as young lettuces, cauliflowers, small salad herbs, early radishes, &c. in the open beds, and under frames and hand-glasses, to defend them from cutting frosts, snow, and other inclement weather; and sometimes in raising, transplanting, or pricking out small or moderate portions of particular sorts of plants, both of the hardy and tender kinds, whether of the esculent or annual flowery kinds in the spring, on beds or borders of natural earth, or in hot-beds, without frames, by being arched over with hoops or rods. They are likewise extremely useful in the spring and summer, in hot, dry, sunny weather, in shading several sorts both in feed-beds before and after the young plants are come up, and in beds of pricked-out small young plants, to shade them from the sun till they take fresh root; as also for shading the glasses of hot-beds occasionally, when the sun is too powerful for particular sorts of plants in the heat of the day, as in cucumbers, melons, and various other kinds.

For kitchen and other garden districts furnished with wall-trees, they are of great use in spring to cover the trees of particular sorts when in blossom, and when the young fruit is setting and advancing in its early growth after the decay and fall of the bloom; by which assistance, in cold winters and springs, when sharp frosts sometimes prevail, a tolerable good crop is often saved, while in trees fully exposed, the whole is cut off by the severity of the weather.

In the flower garden and pleasure-ground, they are also found

found useful on different occasions : in the former, in sheltering beds of curious sorts of choice flower-plants, both in their advancing growth, and to protect them from cold in winter and spring ; and when in full bloom, to shade and screen the flowers from the sun and rain, to preserve their beauty more effectually, and to continue them longer in blow of a fine lively appearance ; as well as to cover beds, &c. in raising various tender annual plants from seed in the spring ; and in the latter occasionally in winter to defend some kinds of curious tender evergreens, &c. such as some of the magnolias, broad-leaved myrtle, olive, tea tree, &c. when standing detached and trained against walls, and other places.

And besides in nurseries, they are of considerable utility in the propagation and culture of numerous sorts of tender curious exotics, in defending them from cold, and shading from scorching sun, while they are in their minor growth, &c. They are necessary also for matting round bundles or baskets of tender or curious plants, when conveyed to a distance.

They are also occasionally of great use in severe winters on such glass works as green-houses, hot-houses, forcing-frames, &c. in covering the glasses externally in the nights, and occasionally in the day time.

In using them, when the ends are open or loose, they should be secured by tying the end-threads or strings of the bafs close and firm, otherwise they soon ravel out loose in that part, and are spoiled. Where made use of in the work of covering and shading, &c. they should generally in uncovering, if rendered wet by rain or snow, be spread across some rail, hedge, or fence, &c. to dry, before folding them together, that they may be preserved from rotting, otherwise they will not last long.

These mats should never have any bafs drawn out of them for tying up plants with, as is too commonly the practice, as by that means they soon become spoiled.

MAT-grass, a term applied to a particular sort of thick clove grass.

MAT-weed. in *Botany*. See LYCEUM.

MAT, in *Sea Language*. See MATTS.

MATA, LA, in *Geography*, a sea-port town of Spain, in the province of Valencia ; 22 miles S.S.W. of Alicant.

MATA, a lake of Spain, in the province of Valencia, near the sea-side ; which naturally produces an immense quantity of salt, that is the property of the king. The exports have amounted in some years to 100,000 tons weight, chiefly for Holland and the Baltic, as well as for Newfoundland and New England, in order to cure fish.—Also, a river of Africa, which crosses the country of Sabia, and runs into the East India sea, S. lat. 19° 30'

MATABOON, a small island in the Socloo Archipelago. N. lat. 5° 2'. E. long. 120° 11'.

MATACA, a bay on the N. coast of the island of Cuba ; 36 miles from the Havanna.

MATAFUNDA, in *Antiquity*, a machine for throwing stones, probably by means of a sling. Some derive its name from the words *fund* and *macltare*, sometimes written *matate*, i. e. a murdering sling.

MATAGARA, in *Geography*, a town of Africa, in Sugulmeffa.

MATAGOLA, a small island in the Pacific ocean, near the coast of Chili. S. lat. 31'.

MATAGUA, a town of the island of Cuba ; 92 miles S.E. of Havanna.

MATAIA, a province of South America, towards the river Amazon, between the mouths of Madeira and Tapaise rivers.

MATAJA, a river of Peru, which runs into the Pacific ocean, N. lat. 1° 20'.

MATAIBA, in *Botany*, Aubl. Guian. t. 128. Juss. 249. See EPHIELIS.

MATAICHI, in *Geography*, a town of New Mexico, in the province of Mayo ; 150 miles E.N.E. of Santa Cruz.

MATALA, a town of the island of Candy, anciently called "Metalla," or "Metallum," on the S. coast ; which was one of the harbours of Gortynia ; 30 miles S. of Candy. N. lat. 34° 36'. E. long. 24° 10'.

MATALI, in *Hindoo Mythology*, is the name given to the person who drives Iravat, the elephant of Indra, and is usually called his charioteer ; but we do not recollect any other vehicle usually allotted to Indra than Iravati ; see those articles.

MATALOE, in *Geography*, a small island in the Indian sea, near the coast of Africa. S. lat. 11° 40'.

MATALONA, a town of Naples, in Lavora ; 13 miles N.N.E. of Naples.

MATAMAN, or **CIMBEBA**, a large country of Africa, near the Atlantic, S. of Benguela, extending from S. lat. 16 to 24, and from E. long. 13° to 18°.

MATAMBA, an extensive country in the interior part of Africa, bounded on the N. by Congo, on the E. by an unknown country, on the S. by Malamba and Benguela, and on the W. by Angola ; about 150 miles from N.W. to S.E., and about the same from N.E. to S.W. : it is divided into five provinces, viz. Upper and Lower Umbé, Upper and Little Ganhelli, and Bondo. The capital is St. Maria de Matamba.

MATAMBO, a town of Peru, in the district of Abança ; 12 miles N.W. of Cuzco.

MATAN, a town of the island of Borneo, near the W. coast, a little S. of the equinoctial line.—Also, a small island among the Philippines, near the port of Sibiu, where the celebrated Magellan was killed in 1521, in an engagement with the natives.

MATANA, a town of Hindoostan, in Oude ; 10 miles N.W. of Kairabad.

MATANCHEL, a sea-port on the W. coast of New Mexico, about 20 leagues to the N.E. of the rocks of Ponteque, over which may be seen, in clear weather, a very high hill, with a break on the top, called the hill of Xalisco, eight or nine leagues from the port.

MATANE, **GREAT** and **LITTLE**, rivers in Lower Canada, which fall from the S. into the St. Lawrence near its mouth. The mouth of the Matane rivers is capable of admitting vessels of 200 tons burthen ; and the coast near them for 20 leagues abounds in fine cod, fit for exportation. Great numbers of whales have also been seen floating on the water, which might prove a valuable fishery.

MATANZAS BAY, a bay on the N. coast of Cuba. N. lat. 23° 15'. W. long. 81° 2'.

MATAPE, a town of New Mexico, in the province of Sonora ; 45 miles S.E. of Pitquin.

MATARAM, a town of the island of Java, and capital of a kingdom on the S. side, near the centre of the island. S. lat. 8° 20'. E. long. 110°. See JAVA.

MATAREA, or **MATARIA**, a town of Egypt, on the site of the ancient On, or Heliopolis, celebrated for its excellent water, and famous for a bloody battle fought between the French and the Turks, March 20, 1800, in which the Turks had 8000 men killed and wounded, besides those who perished in the desert ; five miles N.E. of Cairo.

MATARIEH, a cluster of small islands in lake Menzaleh.

MATARO, an ancient town of Spain, in the province of

of Catalonia; it existed under the Romans, more within land on a spot where vestiges of its buildings are still found, and was rebuilt by the Moors on its present site. It is supposed to be the ancient Illuro of Ptolemy and Mela. Under the Moors it took its present name. It is pleasantly situated on the sea-side, at the extremity of a small fertile plain, which terminates at the foot of a chain of woody mountains. The old town, built on an eminence, retains its inclosure, its walls, and its gates. Its streets are narrow, but the largest, called "La Riera," which runs through the middle, is broad, straight, tolerably well built, and watered by a small stream, with a row of trees by the side of it. The new town, probably a fauxbourg to the preceding, is much larger, more open, and better constructed. It has been lately built, and runs towards the east as far as the sea-side: the streets are broad, long, and straight; the houses are mostly ornamented with paintings in fresco. It is daily increasing in extent: the surrounding country is fertile and well cultivated, and the town has many fountains of excellent water. Mataro is become a considerable town by its industry and commerce; its population, which, about the year 1770, was from 4 to 5000 persons, is now upwards of 25,000. It has a parish-church, three convents of monks, two of nuns, and an hospital. The administration consists of a military and civil governor, an alcade-major, a port-captain, a minister, an auditor of the navy, and a garrison of two squadrons of cavalry. In the town are four manufactories of printed calicoes, two of calico, seven of lace, 17 of blonds, two of soap, 52 looms for silk-stockings, 116 for cotton-stockings, 48 for silk stuffs and velvets, 89 for ribbons and silk galloons, six distilleries for brandy, five manufactories of sail-cloth, eight tan-yards, and 18 manufactories of silk twists, which yearly make, on an average, about 20,000 pounds weight; 17 miles N.E. of Barcelona. N. lat. $41^{\circ} 33'$. E. long. $2^{\circ} 19'$.

MATATANA, a river of Africa, which runs into the India sea, S. lat. $22^{\circ} 20'$.

MATATANES, a town on the E. coast of Madagascar. S. lat. $22^{\circ} 20'$. E. long. 48° .

MATAVAI BAY, or *Port Royal Bay*, a bay near the N. part of the island of Otaheite, but opens to the N.W. and in the South Pacific ocean. The inside of the bay has good anchorage. S. lat. $17^{\circ} 30'$. W. long. $149^{\circ} 13'$.

MATAVAI Point, a cape of the island of Otaheite. S. lat. $17^{\circ} 29'$. E. long. $210^{\circ} 22'$.

MATCH, from the Saxon *maca*, a companion, because, says Johnson, the match is companion to the gun; a kind of rope, slightly twisted, and prepared to retain fire, for the uses of artillery, mines, fireworks, &c.

It is made of hempen tow, spun on the wheel like cord, but very slack; and it is composed of three twists, which are afterwards again covered with tow, so that the twists do not appear; lastly, it is boiled in lees of old wines; whence its colour. This, when once lighted at the end, burns on gradually and regularly, without ever going out, till the whole is consumed.

It is necessary, says Wallhuysen (*L'Art Militaire pour l'Infanterie*, &c. p. 136, printed in 1653), that every musketeer knows how to carry his match dry, in moist and rainy weather, that is, in his pocket; or in his hat, by putting the lighted match between his head and hat; or by some other means to guard it from the weather. The musketeer should also have a little tin-tube about a foot long, viz. enough to admit a match, and pierced full of little holes, that he may not be discovered by his match, when he stands sentinel, or goes on any expedition. This

was the origin of the match-boxes, worn, till of late, by our grenadiers.

Since fuses have been introduced in lieu of match-lock muskets, the consumption of matches has been much less considerable than before. See **MUSKET**.

MATCHADOSH BAY, in *Geography*, a bay on the E. coast of lake Huron. N. lat. $44^{\circ} 48'$. W. long. $80^{\circ} 10'$.

MATCHAPUNGO, a small island near the coast of Virginia. N. lat. $37^{\circ} 28'$. W. long. $75^{\circ} 44'$.

MATCHE, a small island near the coast of China. N. lat. $26^{\circ} 30'$. E. long. $119^{\circ} 54'$.

MATCHGONG, a town of Bengal; 25 miles N. of Burdwan.

MATCHING, in the *Wine Trade*, the preparing vessels to preserve wines and other liquors, without their growing four or vapid. See **WINE**.

The method of doing it is this: melt brimstone in an iron ladle, and, when thoroughly melted, dip into it slips of coarse linen cloth, take these out, and let them cool. This is what the wine-coopers call *match*. Take one of these matches, set one end of it on fire, and put it into the bung-hole of a cask; stop it closely, and thus suffer the match to burn nearly out; then drive in the bung tight and set the cask aside for an hour or two. At the end of this time examine the cask, and you will find that the sulphur has communicated a violently pungent and suffocating scent to the cask, with a considerable degree of acidity, which is the gas, and acid spirit of the sulphur. The cask may, after this, be filled with a small wine, which has scarcely done its fermentation, and bunging it down tight, it will be kept good, and will soon clarify. This is a common and a very useful method; for poor wines would scarcely be kept potable, even a few months, without it. Nor could stums be prepared in large quantities without this help. Shaw's *Lectures*, p. 191.

MATCHOU, in *Geography*, a mountain of Thibet. N. lat. $31^{\circ} 40'$. E. long. $86^{\circ} 29'$.

MATCHTYGONG, a town of Hindoostan; 37 miles N.W. of Benares.

MATCUS, ST., a town of Brazil, in the government of Minas Geraes; 40 miles N.N.E. of Villa Rica.

MATE of a *Merchant Ship*, is an officer who commands in the absence of the master, and shares the duty with him at sea; being charged with every thing that regards the intended management of the ship, the direction of her course, and the government of her crew.

MATE of a *Ship of War*, is an officer under the direction of the master, by whose choice he is generally appointed, to assist him in the several branches of his duty.

Accordingly, he is to be particularly attentive to the navigation in his watch, &c. to keep the log regularly, and examine the line and glasses by which the ship's course is measured, and to adjust the sails to the wind in the fore-part of the ship. He is also to attend diligently to the cables, seeing that they are well coiled and kept clean, when laid in the tier, and sufficiently served, when employed to ride the ship. Finally, he is to superintend and assist at the stowage of the hold, taking especial care that all the ballast and provisions are properly stowed therein. The number of mates allowed to ships of war and merchantmen, is always in proportion to the size of the vessel. Thus a first-rate man of war has six mates, and an East Indianman the same number; a frigate of twenty guns and a small merchant-ship have only one in each; and the intermediate ships have a greater or smaller number, according to their

several sizes, or to the services on which they are employed. Falconer

Other officers have also assistants, called mates; as the surgeon, gunner, carpenter, boatswain, cook, and corporal.

MATE CREEK, in *Geography*, a river of Kentucky, which runs into the Licking, N. lat. $38^{\circ} 4'$. W. long. $83^{\circ} 41'$.

MATEGRIFTON, in the *Military Art*, a machine anciently used for throwing both darts and stones. It was both the destroyer and terror of the Greeks.

MATELEA, in *Botany*, apparently a barbarous name, for the toleration of which we have offered some apology under the article HOSTEA. We shall not attempt to legitimate it, as Linnæus in some instances has done, by any Greek pun, or forced derivation; which in this case might easily be done, though it would still have no reference to the plant. Aubl. Guian. 277. Juss. 144. Lamarck Dict. v. 3. 726. Illustr. t. 179. Brown Asclep. in Mem. of the Wernerian Society, v. 1. 36. (Hostea; Willd. Sp. Pl. v. 1. 1274.) Clafs and order, *Pentandria Dignia*. Nat. Ord. *Contortæ*, Linn. *Apocineæ*, Juss. *Asclepiadeæ*, Brown.

Gen. Ch. Cal. Perianth of one leaf, turbinate, inferior, in five deep, ovate, acute, equal segments. Cor. of one petal, wheel-shaped; tube very short; limb in five deep, roundish, equal segments, folding obliquely over each other. Stam. Filaments five, very short, inserted into the base of the tube; anthers united into a pentagonal head, each of two cells, bursting transversely, and terminated by a membrane; masses of pollen affixed to the outer extremity, with respect to the cells, and covered with the stigmas; crown of the stamens shield-like, lobed. Pist. Germens two, ovate, one of them abortive; styles two, short; stigmas depressed, flattish, recurved. Peric. Follicle lanceolate-oblong, acute, ribbed. Seeds numerous, imbricated, elliptical, crenate, without wings.

Ess. Ch. Corolla wheel-shaped, in five round oblique segments. Crown of the stamens shield-like, lobed. Anthers bursting transversely, tipped with a membrane. Stigmas depressed. Follicle ribbed. Seeds crenate, without wings.

1. *M. palustris*. Aubl. Guian. t. 109. Native of marshes in Guiana. An upright shrub, two feet high, or more, with opposite, lanceolate, acute, entire, smooth leaves, marked with two glands at their base, and supported by shortish footstalks. Flowers green, rather small, in short, simple, solitary, axillary clusters. Follicles pendulous, three or four inches long. Aublet describes a variety with broader, rather elliptical, leaves. Every part, when wounded, discharges a milky juice.

MATELICA, in *Geography*, a town of Italy, in the marquisate of Ancona; 10 miles W. of Ancona.

MATELLES, LES, a town of France, in the department of the Herault, and chief place of a canton, in the district of Montpellier; seven miles N. of Montpellier. The town contains 325, and the canton 2703 inhabitants, on a territory of 217½ kilometres, in 14 communes.

MATEMBO, one of Querimba islands, near the coast of Africa. S. lat. 12° .

MATEO, ST., a town of Mexico, in the province of New Biscay; 120 miles S.W. of Parral.—Also, a town of New Navarre; 130 miles S.W. of Casa Grande.—Also, a town of East Florida, on a river, which runs into the gulf of Mexico; 120 miles W. of St. Augustine.

MATER DARA ET PIA, in *Anatomy*, two membranous coverings of the brain and medulla spinalis. See BRAIN.

MATER METALLORUM, in *Natural History*, a name given by the Saxon mineralogists, and those of some other places, to

a peculiar kind of marcasite or mundic, which they suppose, according to the expression, to be the mother or parent of metals.

The marcasite they call by this name is the common yellow kind, but in a foul state, it being usually mixed with some poor ore of iron, or with some stony matter, which has made it concrete loosely and irregularly, and it is found sometimes formed into thin undulated plates, and sometimes into complex masses; but is always cavernous or spongy, or full of smaller or larger holes. These are often empty; but in some pieces they contain parcels either of the pure native metals, or of rich ores. Pieces of native copper are found in some, and ores of iron and tin in others. And it is said in Saxony, that native silver, in thin plates, is found in some few.

MATERA, in *Geography*, a city of Naples, in Basilicata; the see of an archbishop; 27 miles S.S.W. of Bari. N. lat. $40^{\circ} 50'$. E. long. $16^{\circ} 35'$.

MATERATA, a town of Istria; six miles E.S.E. of Umago.

MATERFILON, in *Botany*, a name given by some authors to the *jacea nigra*, or common knapweed. Our English name *matfellen* seems a corruption of this. See CENTAUREA.

MATERIA CHEMICA, a term used by authors to express such bodies as are the peculiar objects of chemical experiments. The materia chemica, in a large sense, takes in all the bodies of the globe, all these being the subjects of chemistry in its extensive sense; but the curious in chemical researches may be desirous of knowing, in general, what bodies they ought to procure, and have in readiness for them. Dr. Shaw has given a list of these for his Portable Laboratory; and the reader will find a list according to more modern arrangement and nomenclature under our article LABORATORY.

Becher long ago advised the young operator in chemistry to procure to himself a sort of artificial alphabet of nature; and this will serve the purpose very well, where no more is meant than a mere materia chemica, to be put in such order, that it may be readily had recourse to in all its parts. With this the young operator is to proceed regularly, as he would do in learning a language. Forming first syllables out of the joining of two or more letters of this alphabet; and then words, by combining these first sets together; and finally, whole discourses; that is, forming these various simple bodies into mixts, compounds, and decompositions. Becher's Phys. Subter. p. 179.

To avoid miscarriages, and prevent being imposed upon, it will be very proper to cultivate a knowledge of the productions of nature in their crude state, and peculiar places of growth, where being first viewed and examined before they are gathered or dug up, an exact knowledge of them, as nature furnishes them, may be procured. For want of this previous qualification, men, otherwise of great sagacity, have erred in their operations, and perhaps blamed the original author of a process, in which they miscarry; while they are all the while using a wrong subject, or an adulterated or imperfect one, instead of the true. From this mistake alone, numberless complaints have arisen of failure and uncertain success in the processes and experiments recorded even by the best authors.

The person who would work in chemistry with pleasure and success, should make a sufficiently copious collection of a materia chemica of this kind, all the particulars of which he is well assured of, as to the genuineness and perfection of their kinds. These being always ready, will prevent the necessity

necessity of sending to the druggist at every turn, where the things sent for are often either not to be had, or only in a sophisticated state; when this alphabet of nature, composed of the several materials of chemical researches, is like the letters in a printing-house, distributed and lodged in proper cells, it may readily be drawn out for use as occasion requires. It is impossible to express with how little expence and trouble, yet with how great profit and pleasure, numerous experiments, and those of the most difficult kind, may be made, when the operator has, in this manner, all his materials about him. Becher tells us, that he has, in this manner, gone through fifty experiments in a day; and, while writing on chemical subjects, if any difficulty or uncertainty occurred, he immediately got up from his desk, made the necessary experiment, and sat down again to write the certain fact: so that he affirms, there was very little more trouble in making the experiment at the fire, than in describing the process by the pen.

MATERIA Medica, comprehends those substances, which, selected from the animal, vegetable, or mineral kingdom, and employed either in a simple or combined state, are adapted to heal disorders; or, in other words, it is a collection of remedies. Among the ancients, this collection was very limited and imperfect, and yet formed in a fanciful and arbitrary manner, and frequently with a view to imaginary or superstitious virtues annexed to the substances which it contained. This is not to be wondered at, when we consider that all arts and sciences have been progressive in their improvement, and that the urgency of disease would lead those who studied medicine for their own relief, or for the benefit of others, to seek and to multiply remedies. The number of these remedies would naturally be augmented from views of interest; and as the priests of Esculapius were the first and chief practitioners of physic in Greece, whence the science originated, we may suppose that superstition would invent new remedies, or annex some mysterious efficacy to those that had been already discovered. Whilst the priests of Esculapius, thus circumstanced, would endeavour to enlarge their knowledge of remedies adapted to the various disorders that occurred, the temples of their deity afforded peculiar means of preserving the knowledge of the *Materia Medica*, which they acquired: for it was then common for persons, who had been cured of their diseases by remedies prescribed to them in the temple, to hang up their votive tablets, on which was inscribed some account of their disorders, and of the remedies by which they had been relieved. The celebrated Hippocrates was one of the first clinical practitioners, who disseminated the knowledge acquired in these temples; but though his writings are numerous, they are intermixed with so many additions by different persons, and in different ages, that it is not possible, with any satisfaction, to determine what was the true state of the *Materia Medica* in his time. Although Aristotle and Theophrastus, soon after the age of Hippocrates, by laying the foundation of natural history, paved the way for a great improvement in the knowledge of the *Materia Medica*; yet for want of the means of accurately distinguishing substances from one another, this branch of physic remained in much uncertainty and confusion. The writings of the ancient physicians of Greece, now extant, are few; and of course we obtain little information of the progress of the *Materia Medica* among them. We may presume, however, that they were diligent in exploring more efficacious medicines, and that, upon the whole, they were increasing their number. Erasistratus, it is said, simplified the practice of medicine, and thus retarded the progress of the *Materia Medica*, which was promoted by Herophilus, and by Philinus and Sera-

pion, belonging to the sect of empirics. At Rome the knowledge of the *Materia Medica* was extended and improved, by the Greek physicians who practised at Rome. Among these we may reckon Aesclepiades, who, indeed, like Erasistratus, employed only a small number of medicines, Celsus, Scribonius Largus, and Andromachus the elder. Dioscorides, who lived in the time of the emperor Vespasian, is commended by Galen as one of the best and most complete writers on the *Materia Medica*. He has given a long list of medicines, with some opinion respecting each; but Dr. Cullen thinks, that, in several respects, his judgment in general may be suspected. About the same time with Dioscorides lived the elder Pliny, who, though eminently learned, was merely a compiler, and often injudicious, particularly with respect to the *Materia Medica*. Pliny, however, discovered more judgment than many of his contemporaries, in condemning the very luxuriant compositions which at that time were so much affected. Soon after Pliny appeared the celebrated Galen, who, on the subject of the *Materia Medica*, proposed a new system; maintaining that the faculty or power of medicines depends chiefly upon their general qualities of heat and cold, dryness and moisture. This doctrine, however unfounded and erroneous, was implicitly followed by all the physicians of Greece who succeeded Galen, as well as by all the physicians of Asia, Africa, and Europe, for at least 1500 years. When the knowledge of physic had very much declined among the Greeks, it was transferred to the Saracens, who were almost the only persons in Asia and Africa that cultivated science. Several productions of their own climate were added to the *Materia Medica* of the Greeks: but though they made some improvements, as, *e. g.* by substituting, in place of the more violent and drastic purgatives of the Greeks, several of a milder kind; they made no discovery of any medicines of peculiar power; and as they had derived almost the whole of their knowledge of physic from Greece, so in every part of it they had adopted nearly entirely the system of Galen. Upon the whole, it does not appear that they made any improvement, either in the general plan of the *Materia Medica*, or in ascertaining the virtues of particular medicines. One important innovation, indeed, they introduced, which laid the foundation of a considerable change at a subsequent period; and this was the application of chemical operations to the substances appropriated to medicine. As long as the physicians of Europe continued to be the servile followers of the Saracens or Arabians, nothing new occurred among them; but when Constantinople was taken by the Turks, about the middle of the fifteenth century, many learned Greeks were driven into Italy, and thus the literature of the Greeks was transported to the western parts of Europe. The system of Galen, however, was adopted by the contending parties both of the Greeks and Arabians: and the *Materia Medica*, with a few additions by the Arabians, remained as it had been transmitted from Galen; being every where explained by the cardinal qualities and their different degrees, with very little reference to any thing acquired by experience.

We have already observed that chemistry first appeared among the Arabians; and there is reason for believing, that metallic substances were the subjects of some of their first operations. These subjects were principally mercury, and afterwards antimony; and of these substances we find a great variety of preparations in the "*Currus Triumphalis Antimonii*," published under the name of Basil Valentine, and supposed to have been written about the end of the fifteenth, or beginning of the sixteenth century. When the chemists directed the employment of their art to the pre-

MATERIA MEDICA.

paration of medicines, they were soon misled by the fanatical spirit which prevailed among them, and indulged the idea of preparing an universal medicine, and one which should protract life to 1000 years. In the prosecution of these visionary schemes they persisted, when in the beginning of the sixteenth century Paracelsus appeared. From the chemical practitioners of these times he learned the use of mercury and antimony; and from some empirics the use of opium. By the use of these remedies, he cured many diseases which had baffled the inert remedies of the Galenists: and thus establishing his fame, he formed a school of physicians, who appeared in opposition to the established schools, then entirely followers of Galen. Hence the physicians of Europe were divided into the two sects of chemists and Galenists. Early in the seventeenth century, sir Theodore Mayerne, a chemical physician, was called over into England, and distinguished himself as a great favourer of chemical medicines, and particularly of antimony. His fame seems to have terminated in England all distinction between the Galenic and chemical practitioners. Hence it merits particular attention, that in the course of the sixteenth century, the introduction of the more frequent use of chemical medicines, and of the more frequent application of chemistry to the preparation of them, produced a very great change in the state of the Materia Medica. Fossil medicines, some of which were entirely unknown to the ancients, formed a much greater part of it than formerly; and not only those of the metallic, but many of the saline kind, little known before, were now introduced. Distilled waters also, essential oils, quintessences, and extracts, were admitted by those who allowed of chemical remedies at all, to constitute almost the whole of the Materia Medica. While chemistry was thus employed to modify the Materia Medica, it was accompanied by every species of fanaticism, by the doctrines of astral influences, animal magnetism; by pretensions to alchemy, to panaceas, and to medicines capable of prolonging life. All these had some influence on the Materia Medica; but none were more generally received than the doctrines of signatures, which has retained its influence till very lately. The doctrines of chemistry, though attended with many absurdities, were, however, the most promising towards explaining that quality in medicines upon which their virtues depended; and accordingly have ever since been more or less applied to that purpose. It was about this time that certain physicians, who presumed to judge of the constituent parts of medicines, partly from their chemical analysis, partly from their sensible qualities, formed plans of the Materia Medica. After all the schemes that were formed for investigating the virtues of medicines, it must be acknowledged, that the conclusions formed from any of them can hardly be trusted till they are confirmed by experience; and here it will be proper to take notice of two attempts which were made in England to consult experience with regard to the Materia Medica. The first was that of Mr. John Ray, who, in his "History of Plants," thought proper to enumerate the virtues of those which were used in medicine. About the same time Mr. Boyle endeavoured to engage the practitioners of physic in the study of specific medicines, that is, of medicines whose virtues are learned only from experience. Nevertheless, from various circumstances, his collection has contributed very little towards the improvement of the knowledge of the Materia Medica. After this time physicians and chemists began to treat many vegetable substances, either by infusion and decoction in water, or by infusion in spirituous menstrua, and obtaining extracts in consequence of these operations; and labours of this kind have been since pro-

secuted with diligence. By such labours the doctrines of the Materia Medica have been often corrected, and we have been frequently taught not only to distinguish the different degrees of the same quality in different bodies, but they have been particularly useful in directing the most proper pharmaceutical treatment of medicines, and have sometimes afforded an analogy for judging of the virtues of untried substances. At a period, which soon followed, a number of different theories prevailed in the schools of physic; which variously affected the state of the Materia Medica. The Stahlians introduced archeal remedies, and many of a superstitious and inert kind; and, on the other hand, the mechanical physicians, by introducing the Corpuscularian philosophy, or the notion that the small parts of bodies acted upon one another by their figure, size, and density, endeavoured to explain the operation of medicines upon the fluids and solids of the human body, in a manner that countenanced many erroneous opinions concerning their virtues. Dr. Boerhaave, adopting this system, contributed to extend its influence. Another circumstance that served to injure the writings on the Materia Medica was that of referring the operation of medicines to certain general indications; most of which have arisen from defects both of physiology and pathology, and are neither sufficiently explained nor well understood. Notwithstanding the imperfections that have been discovered in the writers on the Materia Medica, and that have been suggested by Dr. Cullen, to whom we are indebted for the preceding hints on this subject, he acknowledges, that, in modern times, and more especially during the course of the last century and towards the close of it, the Materia Medica has received much correction and improvement. "The progress of philosophy has corrected many superstitious follies that were formerly intermixed with the doctrines of the Materia Medica. Chemistry has given us many new medicines, entirely unknown in ancient times; and this science, in its progress, has not only gradually corrected its own errors, but has taught us to reject many inert medicines, which formerly made a part of the Materia Medica. It has taught us a greater accuracy in preparing all its peculiar productions, and to lay aside many of those operations with which it had amused the physician, and had imposed much useless labour upon the apothecary. In particular, it has instructed us how to make the combinations of medicines with greater correctness and propriety; and in all these respects has rendered the whole of the pharmaceutic treatment of medicines more simple and accurate than it was before. Chemistry has thus greatly improved the state of the Materia Medica, and has led physicians to a discernment that should reject that luxuriancy of composition formerly so frequent; and which, even at present, in most parts of Europe, is far from being sufficiently corrected. The reformation in this respect has not yet taken place to any remarkable degree, excepting in the northern countries of Europe, in Britain, Sweden, Denmark, and Russia."

Of the writers on the subject of the Materia Medica, whose names and works are enumerated by Dr. Cullen, the first we shall mention is John Schroeder, of the 17th century, an edition of whose work in the German language was published in 1746, and which has been literally quoted by Ray, Dale, and Alton. The next writer is John Bauhin, who, in his "Historia Plantarum," has written on the virtues of those plants which make a part of the Materia Medica. Of this author Dr. Cullen says, that, exclusively of his botanical merit, "he did not deserve to be followed as he has been by Ray and others after him; and by no means deserves to be read now." Simon Pauli succeeded Bauhin, and was himself followed by Georgius Wolfgangus Wedelius,

MATERIA MEDICA.

Wedelius, who was an abettor of the doctrine of signatures, as well as a believer in the power of amulets. Emanuel Koenig, towards the end of the 17th and soon after the beginning of the next century, published all the parts of the *Materia Medica*, in a manner which Cullen speaks of in degrading terms. John Baptist Chomel published his "Abregé de l'Histoire de Plantes usuelles," in 1712, and has chosen, says Cullen, a proper plan of arranging the subjects of the *Materia Medica*, according to the similarity of their virtues in answering the general indications of cure, but he has executed it very imperfectly. Stephen Francis Geoffroy, though a man of genius, and in many respects of good judgment, has not always manifested it in his writings on the *Materia Medica*. Mr. Lieutaud, in his "Synopsis Universæ Praxeos Medicæ," has distributed the subjects of the *Materia Medica* according to the general qualities by which they are adapted to the several indications arising in the practice of physic; but the indications marked are for the most part ill defined, too general as well as too complicated to convey any instruction to young practitioners. M. Ferrein has, since the time of M. Lieutaud, published at Paris a "Traité de Matière Medicale, &c." which Dr. Cullen pronounces to be superficial and incorrect, and unworthy of the author, who was a man of learning and judgment. The "Precis de Matière Medicale" of M. Venel, published by M. Carrere, is, as Cullen thinks, the most judicious writing that had appeared in France on the subject before his time. Of the writers of Germany Dr. Cullen mentions Zorn, G. Henry Bahr, Buchner, Loefsehe, and J. Fred. Cartheuser. The latter is author of the "Fundamenta Materiæ Medicæ," a work of deserved reputation, in which the several subjects are distributed according to their sensible qualities, or to their more obvious chemical constitution, and many substances are very properly associated by their natural affinities. But this author, says Cullen, often attempts to explain the virtues of medicines by their chemical constitution in a manner that is not satisfactory. He has also employed general terms, which are not only ill defined, but also very often complicated, and sometimes altogether improper. In 1758, the learned and industrious Rud. Aug. Vogel published his "Historia Materiæ Medicæ," of which Dr. Cullen does not speak in very high terms. Another German professor, H. Jo. Nepam. Crantz, published a treatise of the "*Materia Medica et Chirurgica*," which has not contributed to advance the knowledge of the *Materia Medica*. Professor Stielmen of Straßburg, in his "*Institutiones Materiæ Medicæ*," has distributed medicines according to their indications, but with a brevity that often renders him obscure. He has also published a "*Pharmacopœia Generalis*," which Dr. Cullen censures partly for its superfluities, and partly on account of its being superficial and incorrect. But the errors and defects of preceding writers have been corrected and supplied by the "*Apparatus Medicaminum*" of the very learned and ingenious professor Murray of Gottingen; the most complete and perfect work, in Cullen's estimation, that has ever appeared upon the subject. "The author has, with great judgment and medical discernment, from former writers, and more especially from those of latest date, collected every thing which deserved to be repeated. He every where discovers an intimate acquaintance with all the writers on the subject, and always makes a judicious selection of what they afford. By his distributing the vegetable substances according as they belong to the several natural orders marked by the botanists, he has associated the substances of similar qualities and virtues, in a manner that may be of great advantage to students." An improved edition of this work was pub-

lished by Althof at Gottingen, in 1793, &c. in six volumes, 8vo. To the *Apparatus*, &c. by Murray, was added a work of the same kind, with the same title, comprehending the mineral kingdom, by professor Gmelin, in two volumes, published at Gottingen in 1795.

In Sweden the celebrated Linnæus takes the lead, of whom we here need say nothing, but may content ourselves with referring to his biographical article. According to Dr. Cullen, our attention, with respect to the whole that Linnæus has delivered on the *Materia Medica* from vegetables, is very much superceded by the work given us on the same subject by his scholar Bergius. The "*Materia Medica ex Vegetabilibus*," by Petrus Jonas Bergius, is a work of great value and deserving peculiar notice.

Of British writers on the subject of the *Materia Medica* Dr. Cullen mentions Mr. Ray, Dr. Dale, Dr. Alston, and also Dr. Hill, who published a compilation without selection or judgment. He speaks with deserved commendation of the "*Materia Medica*" of Dr. Lewis, more especially as published and judiciously enlarged by Dr. Aikin. Dr. Rutty, of Dublin, after forty years labour in preparing it, has published his "*Materia Medica Antiqua et Nova*," which Dr. Cullen appreciates at a low rate. Dr. Cullen's "*Treatise of the Materia Medica*," in two volumes 4to. was published in 1789. Dr. Woodville's "*Medical Botany*," of which a second edition was published in 1810, with his last corrections, is well known, and highly valued: and we may here add that in this year (1812) Dr. Stokes, well known for his botanical and medical attainments, has published a work of similar title and design to that of Dr. Woodville.

Having given a compendious abstract of the history of the *Materia Medica*, and an enumeration of some of the chief writers on the subject, we shall now proceed to detail, as briefly as possible, the different methods of classification or arrangement which have been adopted, by various writers; premising in general that the means by which the remedial or medicinal characters of different substances are determined in the present day are their own sensible qualities, their botanical affinity, their chemical analysis, and general experience. Of all the different modes of arrangement that have been adopted, the most simple is that of the alphabetic form, but from this we can derive no information with regard to the specific virtues of various substances admitted into our catalogue of the *Materia Medica*. Another mode of arrangement is founded on the class of bodies, or kingdom, to which the different substances belong: and thus we obtain three general divisions of animal, vegetable, and mineral substances. But this method of classification is liable to the same objection with the former, as it is too general, indiscriminating, and uninformative. A more eligible and useful arrangement is that to which we are led by an investigation of the sensible and most obvious qualities of medicinal substances: and accordingly we consider them as acid, alkaline, acrid, astringent, aromatic, glutinous, unctuous, bitter, emetic or cathartic. This mode of distribution was suggested by Cartheuser, though he was under a necessity of deviating from it in his actual arrangement of various substances; and, indeed, it is too vague and inappropriate to admit of general application: for some substances have no discriminating sensible quality; others possess several qualities so nearly similar, that it is difficult to refer them to one class in preference to another: and others again resemble one another in their sensible qualities, and yet are very different in their effects on the animal frame. Another mode of arrangement was adopted by Vogel, who classed his medicinal materials according to their effects on the human body.

MATERIA MEDICA.

These are the general divisions (says an anonymous writer in "Nicholson's British Cyclopædia," of whose article we shall here avail ourselves as far as it is appropriate to our purpose) or classes into which simple medicines are partitioned under this system; but when we begin to consider their virtues more particularly, a variety of inferior divisions must necessarily ensue. Thus, of the relaxing medicines, some, when externally applied, are supposed merely to soften the part; and in such case are called emollients; while others which are supposed to have a power of augmenting the disposition of the secretions of an inflamed part to the secretion of pus, are called maturants or suppuratives. Sedative medicines, that have the power of alluaging pain, are denominated paregorics; if they altogether remove or destroy pain, they are called anodynes; if they take off spasm, antispasmodics; if they produce quiet sleep, hypnotics; if a very deep and unnatural sleep, together with considerable stupefaction of the senses, narcotics. Tonic medicines, in like manner, obtain the name of corroboratives, analeptics, or nervines, when they slightly increase the contractile power of the solids; but of astringents or adstringents, if they do this in a great degree. Some of this order of medicines have been supposed to promote the growth of flesh, to consolidate wounds, and restrain hæmorrhages, and hence the names of sarcotics and traumatica, or vulneraries, names, however, which may well be dispensed with, as the quality is very questionable, and perhaps altogether erroneously ascribed. Other astringents, again, are denominated repellent, discutient, stimulant, or attractive, according to the respective modes by which they are conceived to promote one common effect. Medicines of the inflammatory tribe, are, in like manner, divided into vesicatories or blisters, if by their application they raise watery bladders on the skin; cathæretics, escharotics or corrosives, if they eat into and destroy the substance of the solid parts themselves; and rubefactive or rubefacient, if possessed of less power than the vesicatories, they merely produce a redness on the part to which they are applied, by increasing the action of a part, and stimulating the red particles of the blood, into vessels which do not naturally possess them. The alterant tribe is divided into absorbents, antiseptics, coagulants, resolvents, calefians, and refrigerants, according to the peculiar mode by which the different individuals of this tribe are supposed to operate. The evacuants are generally subdivided from the nature of the humour they are supposed to discharge: emetics, if they evacuate the contents of the stomach by vomiting; cathartics, if they induce purging; laxatives, if they produce a moderate discharge of feces without pain or sickness; eccoprotics, if the discharge be greater, but still confined to the common nature of the feces themselves. Thus again they are named diaphoretics, if they promote the expulsion of humours through the pores of the skin with a small increase of action; sudorifics, if the increase of action be greater, and the discharge more copious. Such as excite urine are called diuretics; such as produce evacuation from the glands of the palate, mouth, and salivary ducts, salivating medicines; those that promote the discharge of mucus from the throat, apophlegmatics; those that evacuate by the nose, ptarmics, errhines, sternutatories; and those which promote the menstrual discharge, emmenagogues. To this order also, some writers reduce those medicines which expel any preternatural bodies, as worms, stones, and flatus or confined air: of these the first are called anthelmintics; the second, and especially when directed to the bladder, lithontriptics; and the third, carminatives.

This system admits of various modifications; and authors

have differed in the number and in the denominations of the classes which they have adopted. Thus, Dr. Cullen has distributed the various medicinal substances which he has introduced into the following twenty-three classes:

Astringents	Antacids
Tonics	Antalkalines
Emollients	Antiseptics
Corrosives	Errhines
Stimulants	Sialagogues
Narcotics	Expectorants
Refrigerants	Emetics
Antispasmodics	Cathartics
Diluent	Diuretics
Attenuants	Diaphoretics
Inpiffants	Menagogues.
Demulcents	

Dr. Darwin comprehends all medical substances under seven classes:

Nutrients	Invertents
Incitants	Revertents
Secernents	Torments.
Absorbents	

Whilst Dr. Cullen's classification has been thought too diffuse, and Dr. Darwin's much too contracted, and adapted merely to his own exceptionable system of nosology, Dr. Kirby, in his small tract, entitled "Tables of the Materia Medica," has adopted eighteen classes, which are, upon the whole, judiciously selected, though his arrangement is not altogether unobjectionable. Independently of the general arrangement of medical substances, there is another circumstance which deserves attention, and that is the nomenclature by which they ought to be distinguished. As the new nomenclature of Lavoisier is now generally adopted in the Pharmacopœias of different colleges of medicine, it will be followed in the annexed table. The compiler of the table has also been anxious to exhibit, in every instance, a glance at the common dose for adult age, as well as to specify in terms as abbreviated as possible, the name of the country in which the different articles exist indigenously; the part or organ of the substance employed; and the disease in which it is supposed to be efficacious. The classification is as follows, and every class is subdivided, as far as possible, into an animal, a vegetable, and a fossil section.

Emetics	Refrigerants
Expectorants	Astringents
Diaphoretics	Tonics
Diuretics	Stimulants
Cathartics	Antispasmodics
Emmenagogues	Narcotics
Errhines	Anthelmintics
Sialagogues	Absorbents.

 Humulus Lupulus*.

* We have inserted the hop among the articles of the Materia Medica, as it probably would have been received by the Edinburgh college, had their Pharmacopeia been published some months later. Within the last year it has been frequently employed in the Edinburgh infirmary as a substitute for opium with great success, as it was found to produce sleep in cases where opium was ineffectual or inadmissible. It is usually administered in the form of a saturated tincture.—Vid. De Roches' "Dissert. Inaug. de Humulo Lupulo. Edin. 1803."

Dr. Spens has adopted it in his edition of the Infirmary Pharmacopeia, and has given a formula of it under the title of "Pilulæ Humuli lupuli."

For an account of the medical properties and use of the several classes, in the preceding table, see EMETICS, EXPECTORANTS, &c. &c.

MATERIA *Subtilis*, denotes a fine subtile matter, which the Cartesians suppose to pervade and penetrate freely the pores of all bodies, and to fill up all the pores so as not to leave the least vacuity, or interstice, between them. See CARTESIANS.

This machine they have recourse to, to support the doctrine of an absolute plenum, and to make it consistent with the phenomena of motion, &c. and, accordingly, they make it act and move at pleasure, but in vain: for were there any such matter, in order for it to be able to fill up the vacuities of other bodies, it must, itself, be entirely void of any, *i. e.* it must be perfectly solid, vastly more solid than gold, and, therefore, more ponderous, and resist vastly more, which is inconsistent with phenomena. See VACUUM, and PLENUM.

Yet sir Isaac Newton allows of the existence of a subtile matter, or medium, much finer than air, penetrating the closest bodies, and contributing to the production of many of the phenomena of nature. The existence of such a matter he argues from the experiment of two thermometers, which being inclosed in glass vessels, "one of them, exhausted of its air, and both carried from a cold to a warm place, the thermometer *in vacuo* grows warm, and rises, almost as soon as that in the air; and, if returned into the cold place, both cool and fall about the same. Hence, says he, is not the heat of the warm room conveyed through the vacuum by the vibrations of a much subtile medium than air, which remained *in vacuo* after the exhaustion of the air? And is not this medium the same whereby light is refracted, reflected, &c.?" See ÆTHER.

MATERIAL denotes something composed of matter. In which sense the word stands opposed to *immaterial*. The Epicureans, Spinofists, &c. own no other but material substances. (See SUBSTANCE.) Among causes, some are material, others are formal. See CAUSE.

Material causes, having no understanding or liberty, must always act in the same manner, when under the same circumstances. Philosophers and divines dispute, whether or no there be any material forms really distinct from matter? (See

FORM.) The Valentinians formerly applied the term material to all people but those of their own sect; asserting that their souls perished with their bodies. Thus also the Stoics maintained, that none but the souls of their wise men survived the body.

MATERIAL Circle. See CIRCLE.

MATERIAL Object. See OBJECT.

MATERIALISTS, a sect in the ancient church, composed of persons, who, being prepossessed with that maxim in the ancient philosophy, *Ex nihilo nihil fit*, *Out of nothing nothing can arise*, had recourse to an internal matter, on which they supposed God wrought in the creation; instead of admitting God alone as the sole cause of the existence of all things.

Tertullian vigorously opposes the doctrine of the Materialists, in his treatise against Hermogenes, who was one of their number.

Materialists is also a name given to those who maintain that the soul of man is material; or that the principle of perception and thought is not a substance distinct from the body, but the result of corporeal organization. (See SOUL.) There are others, called by this name, who have maintained that there is nothing but matter in the universe; and that the Deity himself is material. See SPIRITISM.

MATESHOLM, in *Geography*, a small island in the North sea, near the coast of Lapland. N. lat. 68° 8'.

MATGAR, a town of Hindoostan, in the circar of Kotta; 15 miles S.S.W. of Kotta.

MATHA, a town of France, in the department of the Lower Charente, and chief place of a canton, in the district of St. Jean d'Angely; 14 miles N.W. of Saintes. The place contains 714, and the canton 14,940 inhabitants, on a territory of 205 kilometres, in 26 communes.

MATHAN, a town of Africa, in the kingdom of Bornou, called a royal city. N. lat. 18° 30'. E. long. 21° 40'.

MATHANON PORT, a port in the S.E. part of the island of Cuba, between Cape Cruz and Cape Maizi, which affords good anchorage for ships.

MATHEMATICAL POINT. See POINT.

MATHEMATICAL SECT, in the *History of Learning*, is one of the two leading philosophical sects, which appeared towards the beginning of the seventeenth century: this sect directed its researches by the principles of Gassendi, and sought after truth by observation and experience. The disciples of this sect denied the possibility of erecting on the basis of metaphysical and abstract truths, a regular and solid system of philosophy, without the aid of assiduous observation and repeated experiments, which are the most natural and effectual means of philosophical progress and improvement. The advancement and reputation of this sect, and of natural knowledge in general, were much owing to the plan of philosophizing, proposed by lord Bacon, to the establishment of the Royal Society in London, to the genius and industry of Mr. Boyle, and to the unparalleled researches and discoveries of sir Isaac Newton. Barrow, Wallis, Locke, and many others, were of this sect. See CORPUSCULAR, EXPERIMENTAL, and NEWTONIAN *Philosophy*.

The other sect of philosophers was the metaphysical.

MATHEMATICS is that science which treats of the ratio and comparison of quantities, and is therefore defined the *science of ratios*; some writers call it the *science of quantities*, but this is inaccurate, since it is not quantities themselves which are the subject of mathematical investigation, but the ratio that such quantities bear to each other.

MATHEMATICS.

The term *mathematics* is derived from *μαθησις*, *mathesis*, discipline, science, representing with justness and precision the high idea that we ought to form of this branch of human knowledge. In fact, mathematics are a methodical concatenation of principles, reasonings, and conclusions, always accompanied by certainty, as the truth is always evident, an advantage that particularly characterises accurate knowledge and the true sciences, with which we must be careful not to associate metaphysical notions, conjectures, nor even the strongest probabilities.

The subjects of mathematics are the comparisons of magnitude, as numbers, velocity, distance, &c. Thus, geometry considers the relative magnitude and extension of bodies; astronomy, the relative velocities and distances of the planets; mechanics, the relative powers and force of different machines, &c. &c. some determinate quantity being fixed upon in all cases as a standard of measure.

Mathematics are naturally divided into two classes; the one comprehending what we call *pure* and *abstract*; and the other the *compound* or *mixed*. *Pure* mathematics relate to magnitudes generally, simply, and abstractedly, and are therefore founded on the elementary ideas of quantity. Under this class are included *arithmetic*, or the art of computation; *geometry*, or the science of mensuration and comparison of extensions of every kind; *analysis*, or the comparison of magnitudes in general; to which we may add *geometrical analysis*, which is a combination of the two latter. *Mixed* mathematics are certain parts of physics, which are, by their nature, susceptible of being submitted to mathematical investigation. We here borrow from incontestible experiments, or otherwise suppose bodies to possess some principal and necessary quality, and then, by a methodical and demonstrative chain of reasoning, deduce from the principles established conclusions as evident and certain as those which pure mathematics draw immediately from axioms and definitions, observing, that these results are always given with reference to the experiments on which they are founded, or the hypothesis which furnished the first datum. Let us illustrate this by an example. Numberless experiments have shewn us, that all bodies near the earth's surface fall with an accelerated velocity, and that the spaces passed through are as the squares of the times they have been in falling. This, then, the mathematician considers as a necessary and essential quality of matter, and with this datum he proceeds to examine what will be the velocity of a body after any given time, in what time it will have acquired a given velocity, what time is necessary for it to have generated a given space, &c. and in all these investigations his conclusions are as certain and indisputable as any of those which geometry deduces from self-evident truths and definitions. Again in optics, having established it as a principle of light, that it is transmitted in right lines while no obstacle is opposed to the passage of the rays; that when they become reflected, the angle of incidence is equal to the angle of reflection; that in passing from one medium to another, of different density, they fly off from their first direction, but still follow a certain geometrical law; these principles, or qualities of light, being once admitted, whatever may be its nature, be it material, or be it immaterial, or whatever may be the medium through which it passes, or the surface by which it is reflected, are totally matters of indifference to the mathematician; he considers the rays only as right lines, the surfaces on which they impinge as geometrical planes, of which the form only enters into his investigation: and from this point all his enquiries are purely geometrical, his investigation clear and perspicuous, his deduction evident and satisfac-

tory. To this class of mathematics belong *mechanics*, or the science of equilibrium and motion of solid bodies; *hydrodynamics*, in which the equilibrium and motion of fluids are considered; *astronomy*, which relates to the motion, masses, distance, and densities, of the heavenly bodies; *optics*, or the theory and effects of light; and, lastly, *acoustics*, or the theory of sounds.

Such are the subjects that fall under the contemplation of the mathematician, and as far as a knowledge of these may be considered beneficial to mankind, so far, at least, the utility of the science on which they depend must be admitted. It is not, however, the application of mathematics to the various purposes of society, that constitutes their particular excellency; it is their operation upon the mind, the vigour they impart to our intellectual faculties, and the discipline which they impose upon our wandering reason. "The mathematics," says Dr. Barrow, "effectually exercise, not vainly delude, nor vexatiously torment studious minds, with obscure subtilties, but plainly demonstrate every thing within their reach, draw certain conclusions, instruct by profitable rules, and unfold pleasant questions. These disciplines also inure and corroborate the mind to a constant diligence in study; they wholly deliver us from a credulous simplicity, and most strongly fortify us against the vanity of scepticism; they effectually restrain us from a rash presumption, most easily incline us to a due assent, and perfectly subject us to the government of right reason. While the mind is abstracted and elevated from sensible matter, it distinctly views pure forms, conceives the beauty of ideas, and investigates the harmony of proportions; the manners themselves are sensibly corrected and improved, the affections composed and rectified, the fancy calmed and settled, and the understanding raised and excited to more divine contemplations."

Many of our readers will probably not be disposed to admit, to the full extent, the justness of Dr. Barrow's panegyric; they may think he has over-rated the value of mathematical acquisition, and that some of his assertions are founded in self-sufficiency and pride. But those who form the latter opinion, must be unacquainted with the true character of this celebrated author; and those who entertain the former, are not probably initiated into the mysteries of these sciences; and, therefore, are not competent judges of their value. We are aware, that mathematicians have had calumniators, as well as eulogists; it has even been represented as a science which blunts all the tender feelings of our nature; that it renders its professors vain, arrogant, and presumptuous; as destroying all relish for works of taste and imagination; hardening the heart against every truth, but those of the demonstrative kind; and, consequently, as having a tendency to lead us into infidelity and atheism.

The celebrated author of the *Rambler* indulged some of these notions. It was, he observed, "the great praise of Socrates, that he drew the wits of Greece, by his instruction and example, from the vain pursuits of natural philosophy to moral enquiries; and turned their thoughts from stars and tides, and matter and motion, to the various modifications of virtue, and relations of life." He pursues this thought still farther, and illustrates it by a story which he tells of one Gelidus, a mathematician, who was so absorbed in his speculations, that when his servants came to acquaint him that a house was on fire, and the whole neighbourhood in danger of being burnt, he only replied, that it was very likely, for it was the nature of fire to act in a circle. He even divests this pseudo-philosopher of the common feelings of humanity, and makes him as insensible to the wants of

his family, as to the distressed of his neighbours. But such illiberal notions are a disgrace to their author, and shew a narrowness of mind, that one would not expect to have found associated with so much talent. "A great and comprehensive genius excludes none of the sciences, they all contribute, by various means, to adorn and embellish life; and for this reason ought to be cultivated and improved. Happy is the mind that is not contracted by the study of philosophy, nor enervated by the charms of the belles lettres; that can be strengthened by Locke, instructed by Clarke and Newton; impassioned by Cicero and Demosthenes; and elevated by the powers of Homer and Virgil." Bonycastle's *Astronomy*.

That some mathematicians may have been vain and presumptuous, perhaps cannot be denied; but many, and these amongst the most eminent, have been equally distinguished for their modesty and unassuming manners, of which our Newton furnishes an illustrious example. Admitting, therefore, that the charge is just with respect to certain individuals, unless it can be shewn (and which we believe it cannot) that it applies to a greater proportion of the professors of this science than of any other, the injustice of the accusation, as applied to the science itself, is evident. What science, or what subject can be named, in which the same charge will not apply to individuals; even that which above all might be supposed to have the greatest influence in checking those passions, the great founder of which was a pattern of humility, meekness, and peace; even this sacred cause has been but too frequently disgraced by the bigotry and intolerance of its professors. The next objection to these pursuits is, that they destroy all relish for works of taste, and that genius is unnecessary, and only great labour required, in order to attain the first rank in the sciences. To this we will let Bossuet reply: "Is it," says the philosopher, "at all astonishing, that the ignorant and superficial many should confound the fruits of that knowledge, which is acquired by study, with those new and original truths to which genius alone can give birth? To be just, we must weigh the great mathematicians of well established reputation against the great poets and great orators. Thus on the one side, let us place Homer, Virgil, Racine, Pope, Demosthenes, Cicero, and Bossuet; and on the other, Archimedes, Hipparchus, Galileo, Descartes, Huygens, Leibnitz, and Newton; and it will not then be so easily determined to which side the balance, in point of genius, ought to incline." We might pursue this subject to a much greater length, and enter into a formal defence of the other charges brought against mathematics and mathematicians; but they may be all answered in a word. Their greatest calumniators, amongst whom we place Joseph Scaliger, the abbé Desfontaines, and our countryman Hobbes, were men who coveted fame, and thought themselves competent to acquire it in every branch of human knowledge; they, therefore, attempted the most difficult problems, and their little knowledge of the subject led them into errors which made them the ridicule of all scientific men; thus exasperated and disappointed, they became the enemies of that science in which they had before so vainly desired to shine; and reproached it merely to gratify their pride and revenge.

The history, illustration, and application of the several branches of mathematics, have been treated of under their respective heads in the present work; and it therefore only remains for us, in the present article, to give a brief sketch of the most prominent parts of the history of the whole, in order to trace their progress and mutual dependence, which are lost in the detached accounts. With this view of

the subject, we shall nowhere enter into particulars, but where these are required, reference will be made to the several articles in which such information may be obtained. Neither shall we offer any speculations concerning the origin of these sciences, which is rather calculated to amuse than to instruct; but proceed at once to real historical facts, observing only, with regard to the Egyptians, that they undoubtedly possessed some knowledge of geometry and astronomy before these sciences were transplanted into Greece; but as we are totally unacquainted with the extent of their knowledge, all records of it having been lost or destroyed, it will be safest to advance nothing on this head, and to begin our sketch with the earliest authentic traces of it amongst the ancient Greeks.

It is generally supposed, that the Greeks derived their first knowledge of the sciences from the magi of Egypt, and it was probably known in the former country long before the time of Thales, who is commonly stiled the father of Grecian philosophy, only because he is the first of whom any decided account has been transmitted to us. Herodotus informs us, that Thales predicted a total eclipse of the sun, and though no date is mentioned in this celebrated historian, yet astronomers have now ascertained that the only total eclipse, (and it could be no other than total, from the circumstances attending it,) happened in the year 610 before Christ. See *Phil. Trans.* for 1810, in which is given an elaborate paper on this subject, by F. Bailly, esq. At this period, therefore, it is obvious that astronomy was considerably advanced in Greece, as the prediction of an eclipse is far from being an elementary problem; it necessarily requires a vast number of delicate observations, which could only be obtained after a long series of years. Pythagoras, who is supposed to have been a pupil of Thales, and who flourished about the year 590 B.C., is the next of those celebrated Grecians whose names are rendered immortal by their great and important discoveries. This philosopher, it appears, made considerable improvements in arithmetic, astronomy, and geometry; in arithmetic he is said to have invented the multiplication table, or the *abacus Pythagoricus*; in astronomy, he suggested the idea of the true system, placing the sun in the centre, and making the planets revolve about him; and in geometry he discovered the 47th proposition of Euclid's first book, which alone would have been sufficient to have ranked him with the first of geometers. At this period flourished Anaximander, and soon after Anaximenes, Anaxagoras, and Cleostratus; these were all eminent in astronomy and philosophy. Ctenopidus, 480 B.C., was a learned geometer, author of several problems, and his contemporary Zenodorus is the first of the ancients whose works have been handed down to us; all before his time having been lost or destroyed. About this time also flourished Hippocrates of Chios, who distinguished himself by the celebrated quadrature of the lunes which bear his name, as well as by his discoveries connected with the problem of *doubling the cube*, which excited great interest amongst the ancient mathematicians of this period. (See *DUPLICATION of the Cube*.) This discovery revived some hopes of obtaining the required solution, but it soon appeared that the difficulty was merely changed, and not in the least diminished, and that it still presented obstacles that were insurmountable. This did not, however, discourage other mathematicians from following up the pursuit; and several curious geometrical properties were the result of these investigations; the *conchoid* of Nicomedes, the *essoid* of Diocles, and the *quadratrix* of Dinostratus, owe their origin to the same source.

Passing over some mathematicians and astronomers of less note,

note, we come to Plato, who cultivated both astronomy and geometry with great assiduity, about 390 years B.C. The celebrated inscription that he caused to be placed over the door of his school, "Let no one enter here who is ignorant of geometry," is a proof of the high estimation in which he held the latter science. To this philosopher we owe the introduction of the conic sections into geometry, and his disciple Aristeus is said to have composed five books on these curves, of which the ancients have spoken with the greatest commendations, but unfortunately they have not been transmitted down to our time. Besides Aristeus, Plato numbered amongst his friends, or scholars, Eudoxus, Menechmus, and Dinostratus; the former of whom was very celebrated for his extensive knowledge in astronomy and geometry; Menechmus, for his application of the conic sections to various problems; and the latter for the invention of the *quadratrix*, as applicable to the problem of doubling the cube, which seems to have been the germ of what is now termed the geometrical analysis.

It was about 90 years from the time of Plato to that of Euclid, during which period all the sciences were considerably advanced and extended, and treatises on particular subjects appeared from time to time, in which all the propositions then known were collected and arranged in systematic order, which was the object of Euclid in his celebrated *Elements*, a work which has met with a success incomparably surpassing that of any other book of science that ever was published, having been taught exclusively for several centuries in every place of mathematical instruction, and is therefore too well known to need any particular description. We are now arrived at that period when the Grecian sciences were in their meridian splendour; Archimedes, one of the greatest geometers that ever appeared in any age or country, followed soon after the time of Euclid. His universal genius led him to the contemplation of almost every species of human knowledge, and nearly every branch of mathematical science is indebted to him for his numerous and important discoveries. Arithmetic, geometry, mechanics, optics, hydrodynamics, were alike the objects of his investigation, and experienced alike the powerful effects of his superior talents. We cannot in this place enter into a particular description of these discoveries, and must therefore refer our readers to the article ARCHIMEDES, in which an abstract of the most important of them will be found. After Archimedes, at the distance of about fifty years, another celebrated mathematician, Apollonius, cultivated the mathematical sciences with the greatest possible success, for the particulars of whose discoveries and writings we must refer to the article APOLLONIUS. This period, as we before observed, (B.C. 250) was the most brilliant era of ancient geometry, for after these great men we meet with no other mathematician of the first order, yet there were several who cultivated both geometry and astronomy, and which nothing but the confined limits of this article would justify us in passing over in silence; such, for instance, as Eratosthenes, who first attempted to measure the circumference of the earth; Ctesibius, to whom we are indebted for the useful invention of water pumps; Hero of Alexandria, who was much celebrated for his application of geometry to the practical purposes of mensuration, and to whom we are indebted for the invention of clepsydræ, or water clocks. We might also enumerate many other eminent mathematicians and astronomers, but as we are under the necessity of limiting our observations to those who are most pre-eminently distinguished, we shall pass at once to Hipparchus, the prince and father of astronomy, who flourished about 142 B.C. To him we are indebted for the first effec-

tual classification of the stars; for ascertaining nearly the duration of the year; the discovery of what he called the *eccentricity* of the solar orbit; the *precession of the equinoxes*; and various other important discoveries and observations: besides which Hipparchus had the merit of applying this science to the purposes of geography; he reduced to certain and invariable principles the method of determining the situation of places on the earth, by means of their latitudes and longitudes, of which, however, some notions were entertained as early as the time of Alexander. The next mathematician of eminence was Theodosius, who wrote an excellent work on the sphere, which may be considered as an introduction to spherical trigonometry; and though many of the author's propositions are almost self-evident, yet faithful to the views of the ancients, he has submitted them all to the most rigorous demonstrations, a task which he has performed with the greatest elegance. After this author, we proceed for three or four hundred years without meeting with any geometrician who is much distinguished for his discoveries or improvements. The sciences had been for a long time in a declining state, in the school of Alexandria, when the celebrated Ptolemy began, in some measure, to revive them, at least astronomy, by reducing all the parts of it into more order and consistency, A.D. 140. His principal work, the "*Almagest*," (a word derived from the Arabic, signifying *the great collection*,) contains all the ancient observations and theories, to which his own researches being added, he may be said to have formed of the whole the most complete collection of ancient astronomy that ever appeared; a work which supplies, in some measure, the place of those that preceded it, and for the compilation of which its author will be ever entitled to the gratitude of astronomers. It was some years after this period, (though the exact time has never yet been ascertained,) that Diophantus, a celebrated mathematician also of the Alexandrian school, made a new and remarkable step in arithmetic, by the invention of the indeterminate analysis; a species of algebra, and which is the first trace we have of this extensive branch of mathematics. The work consisted of 13 books, of which however only six have ever reached us, unless a seventh, which is found in some editions of Diophantus, be his work, which is considered as doubtful. This treatise displays great talents and originality, and has ever been held in the greatest esteem by analysts of all ages, and has accordingly been commented upon and explained by various writers, both ancient and modern, but most of those of the former are lost. Of these we regret the commentary of the celebrated Hypatia, daughter of Theon, who flourished about the year 410 of the Christian era. The talents, virtues, and misfortunes, of this illustrious victim of fanaticism, have a claim to the homage of posterity, while the remembrance of the deed, and the perpetrators of it, will as deservedly be execrated and abhorred by every friend of science and admirer of female virtue. (See HYPATIA.) What was the distance of time between Diophantus and Theon is not distinctly known, it was however barren of any distinguished authors. About this period we meet with Pappus and Diocles, the latter of whom has been already mentioned in speaking of the duplication of the cube, and the former also made some ingenious advances, both with regard to this problem, and that of the trisection of an angle; but what he is more particularly distinguished for, is his collections of the various works of his predecessors; these collections contain one of the most valuable monuments of ancient geometry: in them he has assembled together a number of excellent works, almost all of which are now lost, and to them he has added several new, curious, and learned

propositions of his own; an interesting account of which is given under the article Pappus in Dr. Hutton's "Mathematical Dictionary;" see also the same article in the present work. After Pappus we meet with Eutocius, A.D. 520, who was himself a great mathematician; and whose commentaries on the works of Archimedes and Apollonius in particular are much esteemed. To the names already mentioned may be added those of Proclus, Marinus, and Hero the younger; to the former we are indebted for his commentary on some of the books of Euclid, but more for the kindness, attention, and protection, which he afforded to those who pursued those studies in his time. Marinus and Isidorus, his contemporaries, are celebrated for their architectural skill, and to them it is said we are indebted for the invention of domes; and Hero, who is surnamed the younger, to distinguish him from the learned author of the same name of *Alexandria*, is equally celebrated as an engineer, and for his rule for finding the area of a triangle when the three sides only are given.

We are now arrived at that period so fatal to the sciences. These had for a long time taken refuge in the museum of Alexandria; where, destitute of support and encouragement, they could not fail to degenerate. Still, however, they preserved, at least by tradition, or imitation, that ancient and strict character which had been impressed upon them by the Greeks; but about the middle of the seventh century, a tremendous storm arose, which threatened their total destruction. Filled with all the enthusiasm a militant religion inspires, the successors of Mohammed ravaged that vast extent of country which stretches from the east to the southern confines of Europe. All the cultivators of the arts and sciences, who from every nation had assembled in Alexandria, were driven away with ignominy; some fell beneath the swords of the conquerors; others fled into remote countries, to drag out the remainder of their lives in obscurity and distress. The places and the instruments which had been so useful in making an immense number of astronomical observations, were involved with the records in one common ruin. The whole of that precious library which contained the works of so many eminent authors, and was the common depositary of every species of human knowledge, was entirely devoted to the flames by the Arabs; the caliph Omar observing, that if they agreed with the koran they were useless, and if they did not, they ought to be destroyed; a sentiment worthy of such a leader, and of the cause in which he was engaged.

Here followed several ages of the most wretched barbarism and ignorance, so that it is even wonderful that the sciences should ever again have recovered this deadly blow; but as we before observed, some of the philosophers of Alexandria escaped the vengeance of their barbarous conquerors, and these of course carried with them some remnant of that general learning, for which this school was so deservedly celebrated. Still, however, destitute of books, of instruments, and probably also of the means of existence without manual labour, very little farther knowledge could be accumulated, and still less propagated, so that in a few years every species of knowledge connected with philosophy and mathematics must have become extinct, had not the Arabians themselves, within less than two centuries from this fatal catastrophe, become the admirers and supports of those very sciences which they had before so nearly annihilated. They studied the works of the Greeks with the greatest assiduity, and if they added little to the stock of knowledge which these works contained, they became sufficient masters of many of the subjects to enable them to comment upon them, and to set

a due value upon these precious relics of ancient science; by which means they have been preserved, and handed down to the moderns. Of all the branches of mathematics, astronomy was that which the Arabs held in the greatest estimation, at the same time however they did not totally neglect the other branches. Our present system of arithmetic is derived from these people, though it does not appear that they were the inventors, but had acquired their knowledge of it from the Indians. Geometry also, and particularly trigonometry, owe much to the improvements of the Arabs. Mohammed Ben Musa, and Geber Ben Alpha, who lived about the eleventh century, are both well known for their scientific works. Amongst the Arabian princes and astronomers, the most celebrated are, Almanfor, who flourished about the year 754; Al. Maimon, who reigned from 813 to 833, in whose time, in consequence of the great support and assistance which he afforded to the sciences, we find them making very considerable progress; Alfragan, Thebit Ibn Chora, and Albategni, were particularly distinguished about this period. Thebit was an algebraist, geometrician, and astronomer; Alfragan composed elements of the latter sciences, of which several editions have been published since the invention of printing; and Albategni, in consequence of his numerous and important observations, and accurate knowledge, was surnamed the Arabian Ptolemy. The works of this author have been collected in one quarto volume, entitled "*De Scientia Stellarum*," of which there are two editions, one published in 1537, and the other in 1646. We cannot here enumerate all the Arabian astronomers and mathematicians who distinguished themselves for several centuries, an extensive list of whom, with their respective works, is given by Montucla in his valuable History of Mathematics; we must not however pass over Alhazen, a very celebrated Arab, who settled in Spain about the year 1100, and to whom we are indebted for a treatise on optics, and for the first theory of refraction and twilight.

About this time the mathematical science began to be propagated in several European countries. So early as the year 1202, an Italian merchant, Leonardus de Pisa, had composed a treatise on algebra, in which he succeeded in the solution of equations of the third degree, and those of higher dimensions, in certain cases, where they would allow of reduction. Jordanus Nemorarius was another eminent author in his time (A.D. 1230); he wrote on arithmetic, geometry, and the planisphere; but his contemporary, John of Hallifax, commonly Sacrobosco, was much better known. This latter author was an Englishman, but went and resided as professor of mathematics at Paris. We have a treatise of his on the sphere; which has been commented on by Clavius, the jesuit, and reprinted a great number of times; he likewise left us a treatise on the astrolabe, on the calendar, and on the arithmetic of the Arabs. In 1250, Campanus Novara translated and commented on Euclid's Elements, and wrote a treatise on the sphere, and another on the theory of the planets, the object of which was to explain the ancient astronomy, and the corrections introduced by the Arabs. We have another work of the same period on optics, by Thomas Pecam, who from a simple observant monk became archbishop of Canterbury; this treatise has been several times reprinted, and was long considered as a classical work. The sciences at this time found a zealous patron in the great emperor Frederic II., even amid the continual wars he had to sustain against the pope. This prince ascended the throne in 1219, and died in 1250 during, which period he founded the university of Naples.

MATHEMATICS.

Another celebrated philosopher of this period was Roger Bacon, an Englishman, who was born in 1214, and whose numerous works have been repeatedly reprinted. His treatise on optics is considered a very masterly performance for the time in which it was written. It has even been asserted, that he understood the use of spectacles, and was the inventor of gunpowder; but in fact neither of these discoveries can be properly attributed to him, though, with regard to the latter, he was certainly upon the verge of it, but he did not thoroughly explain it, nor was this done for many years after. Bacon was persecuted by the monks, being accused by them of magic, and was on this charge thrown into a dungeon, from which he was not liberated, till he had fully convinced his superiors, and the pope, *that he was no magician, nor had ever held any correspondence with the devil.* With regard to the invention of spectacles, it was not made till after the death of Bacon, by Alexander Spina, a Jacobin friar, who died in 1313.

The 14th century produced few scientific men of eminence; but some of those who, though they did not advance this subject, prevented it from being lost, deserve to be mentioned. Of these we may enumerate Peter of Albano, who wrote a treatise on the astrolabe; and Cecehi Alcoli, professor of mathematics at Bologna, who composed a commentary on the sphere of Sacrobosco, which was several times reprinted. Both these men acquired the reputation of forcerers and heretics, in consequence of which the former was burnt in effigy, and the latter in person, in the year 1328, at the age of seventy. In Germany, John of Saxony, an Augustine friar, wrote on the Alphonine tables, and on eclipses, and Henry of Hesse, professor at the newly founded university of Vienna, treated on the theory of the planets; but these works were never printed. We might mention some other names, as John de Muris, author of a system of music, and an astronomical work; John de Lignières, also an astronomer at Amiens, and a few others; but their works being now wholly forgotten, it would answer no purpose to lengthen this article, and fatigue the reader with uninteresting details. Some progress, however, was made in mechanics during this century; wheeled clocks were constructed, which exhibited, besides the hours, several of the planetary motions; paper-mills were invented or improved, and the useful article paper began to get into common use.

The 15th century, to which we are now arrived, was much more fruitful in men of science and genius than any we have met with since the time of the ancient Greeks. Amongst those who cultivated geometry and algebra at this time, is principally to be distinguished Lucas Paccioli, or Lucas de Burgo, who was a Franciscan monk, and flourished towards the end of this century. He composed several works, translated Euclid into Latin, to which he added some learned annotations; he also published a work entitled "Summa de Arithmetica Geometria, &c." in which we find the common rules in arithmetic, the rule of false position, and the resolution of simple and quadratic equations; we are likewise indebted to him for two other works, one entitled "De Divina," and the other on the regular bodies.

Astronomy also made considerable progress in this age. Its first benefactor was John Gmunden of Vienna, and Peter Dailli, who, in 1414, proposed to the council of Constance a reformation of the calendar, which was become very incorrect. The cardinal Nicholas de Cusa ought also to be particularly distinguished for his persevering through fruitless attempts to revive the Pythagorean system. To

these may be added Purbach, and his pupil Regiomontanus, who were two of the greatest promoters of astronomy at this period. They observed the heavens together at Vienna for ten years, and after the death of Purbach, his pupil took a journey to Rome to learn the Greek language with more facility, in order that he might read the other Greek works; Ptolemy having been before his principal resource. Here his progress was very rapid; for in a short time he translated into Latin the Conics of Apollonius, the Cylindrics of Serenus, the mechanical questions of Aristotle, the Pneumatics of Hero, all the works of Ptolemy, &c. Besides these labours, he was author of several excellent works of his own, particularly one on trigonometry; he was also employed by pope Sixtus IV. in the reformation of the calendar, but died before it was completed, in 1476. In France, James Lefevre cultivated the mathematics with success, rendering them considerable service by his translations and other performances. In Italy, John Bianchini constructed astronomical tables, much esteemed in their time; James Angelo, a Florentine, translated Ptolemy's geography; and Dominic Maria Novera of Bologna initiated Copernicus into astronomy. In Germany, John Engel, a Bavarian, published ephemerides of celestial motions, and proposed a scheme for reforming the calendar. In Spain, Ferdinand of Cordova commented upon Ptolemy's Almagest, and Bernard of Granolachi published also ephemerides in 1488, and calculated as far as 1550. In this century also, the properties of the magnet began to be better understood; some considerable voyages were undertaken and successfully performed; sea-charts were invented by Henry duke of Visco; new lands and continents were discovered; in short, every thing seemed to promise a rapid progress in the cultivation of the sciences.

Early in the 16th century, we meet with several distinguished analysts and geometers. Of these Cardan is perhaps the best known, though some of his contemporaries equally distinguished themselves: such was Tartaglia, the author of the solution of cubic equations, which is commonly, though falsely, ascribed to Cardan. (See IRREDUCIBLE CASE.) A pupil of Cardan, Lewis Ferrari, also distinguished himself by his solution of biquadratic equations; the same was also done by Bombelli of Bologna, who likewise made several other important improvements and discoveries; amongst the rest, shewing that the two branches of the common expression for the root of a cubic equation of the irreducible case was a real quantity, and thus removing what had been before considered as an unaccountable paradox. We ought also to mention Maurolicus, a Sicilian abbot, who discovered a method of summing several series, as for instance series of squares, cubes, &c., as also the triangular and other figurate numbers. But during this century, no one has greater claim for his analytical discoveries than Vieta; to whom we owe a very important improvement in the algebraical notation. Before his time no solution of any but numerical equations had ever been attempted; the unknown quantity was represented by some letter or symbol, and all the other quantities were absolute numbers, and all particular rules were expressed in words at length as in arithmetic: but Vieta, by introducing letters as representatives of quantities, whether known or unknown, gave a generalization to the algorithm of this science, which is now one of its most important characteristics. To the same celebrated author we are indebted for the theory of angular sections, a branch of analytical trigonometry, which has been so fruitful in the hands of the Bernoullis and Euler; as we are also for the first general

idea of applying algebra to the solution of geometrical problems, an invention which is falsely ascribed to Descartes. What is given above relates principally to analysis, but geometry also made some progress during the same period, though no very important discoveries were made in this science, except so far as that which relates to the angular sections of Vieta above-mentioned; however, Tartaglia, Maurolicus, Commandin, and Ramus may be considered as possessing a respectable knowledge of this subject, and as having by their works and translations rendered it considerable service: besides these, we may mention Peter Metius, Hadrianus Romanus, and Ludolphus van Ceulen, each of them authors of different methods of approximation with regard to the ratio of the circumference to the diameter of the circle; the latter of whom, in particular, carried it to 36 places of decimals. Astronomy also was considerably advanced during this century; Copernicus very early in it made, or at least attempted to make, that important reformation of placing the sun in the centre of the system, according to the ancient or Pythagorean doctrine, though his work "De Revolutionibus," in which it is contained, was not completely finished till the year 1543, the author dying on the very day on which he received the first complete copy. This system, which is now so universally confided in, so simple in its mechanism, so conformable to all celestial appearances, and so worthy of the great and omnipotent architect, was, through the ignorance and superstition of a few contemptible bigots, declared to be heretical. To assert the mobility of the earth, or the fallibility of the pope, were considered as crimes of the blackest dye, and were accordingly visited with the most ingenious torture of the Inquisition; fortunately, however, for the cause of truth, and the sciences, this institution has long since been disarmed of its terror, and the true system of astronomy is now supported upon a basis, which no inquisitorial power will ever be able to destroy. Of those who most contributed to support the Copernican system, must be particularly distinguished the celebrated Galileo, whose important discoveries in various branches of astronomy, mechanics, and philosophy, are too numerous to admit of a minute detail in this place; we must therefore refer the reader for particulars to the article GALILEO. We shall, however, for the sake of connection, mention his discovery of the law of falling bodies, and his invention, or at least important improvement in the use of the telescope; whereby he first discovered the satellites of Jupiter. Tycho Brahe, the Danish astronomer, also flourished about this time, and is deservedly celebrated for his numerous and accurate celestial observations, which, aided by those made by himself, furnished Kepler with sufficient data to investigate the planetary motions, and finally led to the establishment of those laws that bear his name; and which may be considered as the first step towards the true theory of physical astronomy. See KEPLER'S *Laws*.

Such was the state of the sciences at the commencement of the 17th century, when a most important discovery was made by baron Napier, of Merchiston, in Scotland, who in 1614 published his "Logarithmorum Canonis Descriptio, &c." a work which entitles its author to a rank amongst the first-rate mathematicians. Previously to the invention of logarithms, all trigonometrical and astronomical calculations were attended with immense labour, in consequence of the numerous operations in multiplication and division which entered into them, at the same time that the results were necessarily attended with less certainty. But by this happy invention, all the most tedious cases were rendered extremely

easy, and consequently great facility given to astronomical and trigonometrical computations. It was not, however, in the first instance, so well calculated for general practice as the system in present use; for which we are indebted to Henry Briggs, professor of mathematics in the university of Oxford, who laboured with the greatest possible zeal to bring them into their present state. We shall not in this place enter into any description of the nature of these numbers, as this is already done under the article LOGARITHMS: it will therefore be sufficient for our purpose to name those who, at this period, most distinguished themselves in the advancement of this department of science; such were Gellibrand, Gunther, and Vlacq, all friends or pupils of Briggs; and to these we may add Justus Byrge, a German, who printed a table constructed according to the inverse order of our common tables of logarithms. Instead of considering the numbers relative to the geometrical progression as the principal numbers, to which the logarithms ought to be subordinate, he, on the contrary, considered the logarithms as the principals, to which he made those depending on the geometrical progression correspond. But this system met with very little success, being in no respect calculated for common use, in consequence of the immense tables which it required.

About this period, 1620, Harriot, a well-known English analyst, enriched algebra by several important improvements, who first substituted small letters instead of the capitals used by Vieta; and proved that every equation has as many roots as there are units in the index of the highest power, and that all equations may be considered as produced by the multiplication of equations of the first order. Descartes also shewed the method of expressing curve lines by means of equations, and of distributing them into different classes, according to the different order of these equations. We are also indebted to the same author for a method of drawing tangents, maximum et minimum, the theory of curves of double curvature, &c. problems which do their author more substantial honour than his more lofty, but hypothetical theory of vortices, and other of his philosophical speculations, which latter, however, are not materially connected with the present subject. Fermat also contributed largely at this period to the improvement of analysis, particularly in what relates to the Diophantine problems, and the theory of numbers; the latter of which branches may be said to date its origin from this time: many elegant numerical theorems were discovered by this author, most of which were left without demonstration, and some of them still remain to exercise the talents of the ablest analysts of the present day. Several other mathematicians might here also be mentioned, who contributed to the advancement of the sciences at this period, but the limits of our article will not admit of such an enumeration; we must not, however, pass over Cavalierius, who first left the beaten path of the ancients, and treated geometry in a manner totally different from what they had done, and thus facilitated the operations in a variety of difficult problems; but at the same time it must not be denied, that it wanted the accuracy and certainty which characterized the ancient method. His work, which contained the doctrine of Indivisibles, was published in 1635, and may be considered the first link in the modern geometry. Mechanics and hydrodynamics were cultivated with equal success during this period. Torricelli, a pupil of Galileo, following the path of his master, made several important improvements; the most celebrated of which was his determination of the gravitating power of the atmosphere. This discovery led to that of the barometer, or rather perhaps the latter led to

MATHEMATICS.

the former; for it was by an instrument of this kind that he was enabled to determine the weight of this fluid. The result obtained by this means was opposed by various arguments, till the well-known experiment of the Puy-de-Dôme set the question at rest for ever. This experiment was projected by the celebrated Pascal, to whom we are indebted for many important discoveries in various branches of the mathematical sciences, particularly for the first ideas of the doctrine of probabilities, which has become in latter times an extremely useful science, being that on which are founded all calculations connected with life-insurances and annuities. The subject was but slightly touched upon by Pascal, but was afterwards considerably enlarged by Montmort, and finally completed by De Moivre.

At this period almost every branch of science was cultivated with the happiest effect; problems were proposed by the mathematicians of one country as challenges to those of another; a lively emulation was excited between the contending parties; and each supported the honour of his country with all the power he possessed. This was the means of producing many curious propositions and interesting theories, but the limits of our article will not allow of entering upon this subject, and we must therefore reluctantly pass over in silence many eminent writers of this time, whose names would otherwise deserve to be recorded. We must not, however, omit Dr. Wallis, who, in 1665, published his *Arithmetic of Infinites*, a work abounding with genius, and of which the object was to determine the sums of various series of numbers, the quadrature of certain curves, and many other subjects, in which this author discovered a profound knowledge of geometry and analysis; to him we owe the method of denoting radical by fractional indices, as we do also the use of negative indices; Descartes having employed exponents in positive and integral powers only. The theory of continued fractions also date their origin from this period, having been first discovered by lord Brouncker, of Castle Lyons, in Ireland, who was born in 1620, and died in 1684. Another eminent mathematician of this date deserves particular attention, the celebrated Huygens, a Dutchman, whose extensive and persevering genius led him to the cultivation of every department of science; geometry, astronomy, analysis, and mechanics, are indebted to him for important improvements; in the former his theory of evolutives displays the powers of his mind; in astronomy his name will ever be remembered for his discovery of what is now termed the fourth satellite of Saturn, and the ring by which that planet is encompassed; which discoveries were made by means of a powerful telescope which he had himself constructed; the theory of pendulums, their vibrations, the centres of oscillation, percussion, and various other interesting and useful mechanical problems are due to this distinguished author. (See HUYGENS.) It was also towards the conclusion of this century, at which we are now arrived, that the progressive motion of light was discovered by Roemer, a Danish mathematician and astronomer; before his time the propagation of light was supposed to be instantaneous, but by observations of the eclipses of Jupiter's satellites, this was found to be erroneous, and not only its progressive motion became obvious, but the velocity with which it moves was pretty accurately ascertained. Dr. Hooke, another celebrated English philosopher of the same date, here also claims our attention. To this distinguished author we owe a variety of discoveries and improvements in various branches of mechanics and astronomy, but of all these, perhaps his ideas of universal gravitation, though they were not complete, are the most deserving of notice. On this head he made the following suppositions:

all the celestial bodies have not only an attraction or gravitation towards their own centre, but they mutually attract each other in the sphere of their activity. All bodies which have a simple and direct motion, would continue to move in a right line, if some force were not incessantly turning them out of it, and compelling them to describe a circle, ellipsis, or other curve. Attraction is so much the more powerful, as the attracting body is more near. These cases all enter into the Newtonian system, and only the law of attraction was wanting to render the theory complete.

We have not hitherto mentioned the name of Newton, though most of his discoveries were made prior to the beginning of the 18th century; because we wished to consider this important epoch unconnected with any extraneous matter, and to bring together in this place only those distinguished authors who contended with each other that crown of glory, which by universal consent has been placed upon the brow of the English philosopher. Under this class are included Leibnitz, and the brothers John and James Bernouilli, to whom must also be added the marquis de l'Hôpital, a French nobleman, as much distinguished for his amiable and upright disposition as for his profound knowledge in analysis and geometry. It does not enter into our plan to give a minute description of the labours of each of these authors, as that would far exceed the limits of this article; we must therefore confine our observations to what may be considered real discoveries, and in these our illustrious countryman will necessarily form the most prominent object; the Bernouillis undoubtedly possessed a most powerful genius, and gave the solution of problems the most refined that ever exercised the mental faculties of man; still their works are not of that description which can properly form a part of a brief abstract of mathematical history, though in a more extended account they would form a very considerable part; the same observation has place with regard to de l'Hôpital. To Leibnitz we are indebted for the discovery of the differential calculus, at least it was he who first published it in the *Leipscic Transactions* for 1684, though his real claim to the original invention has been always a matter of dispute between the English and foreign mathematicians; the former contending that he had derived his method from hints which he had received, and from letters that passed between him and Newton and other English analysts. It is impossible in this place to enter upon the merits of Leibnitz's claims to the priority of invention, we must therefore refer the reader who wishes to see the matter fully investigated, to the "*Commercium epistolicum de Analysis promotâ*," published by order of the Royal Society, in which the whole of this subject is minutely investigated. Montucla has also given in his "*Histoire des Mathématiques*," an impartial investigation of these claims, but Bossut is evidently biased, and not only on this subject, but in others relating to Newton is tardy in his acknowledgment of his sterling merit. With regard to Leibnitz and Newton, they were both rich in genius and invention, and it is not improbable that both arrived at the same calculus by different routes. One is unwilling to attribute to so celebrated a man as Leibnitz, so mean an action as that of plagiarism, and with regard to Newton it never was insinuated by any of his opponents that any charge of this kind attached to his doctrine of fluxions. In fact, when we consider the methods of *maxima et minima*, of Fermat, Roberval, and Hudde, and the differential triangle of Barrow, each of which were so many advances towards the perfection of the new analysis, it will not be at all surprising that the same general results should be deduced by two such men as Leibnitz and Newton; where so much had been already

ready

MATHEMATICS.

ready prepared for their use, and which only wanted a great and comprehensive genius to generalize and bring it to perfection. The invention of fluxions, though it will ever form a most important era in the history of the exact sciences, is still by no means the greatest of Newton's discoveries. Physical astronomy, chronology, and optics, are equally indebted to him, and shew the power and extent of his universal genius. It would be useless to attempt to enumerate in this place his discoveries in these sciences, we must therefore refer the reader to the articles **ATTRACTION, GRAVITATION, FLUXIONS, OPTICS, &c.** as also the biographical article **NEWTON**, where he will find a more ample detail of particulars than could with propriety be given in this general sketch, the object of which is not to enter into the minutæ of the history, but merely to trace the general outline of the progress of the sciences, and the connection and dependence of the several parts upon each other, which view of the subject is lost in the detached histories of the separate branches. We must now pass rapidly over the history of the last century, not that it is less prolific in events than the preceding, but because the events are more recent, and many eminent authors of this period still exist, and are still enriching the sciences with their discoveries. Of those that are no more, we ought particularly to distinguish Halley, Bradley, Taylor, d'Alembert, and Euler. Of these Halley will ever be remembered for his numerous and accurate astronomical observations, and particularly for his being the first and only astronomer that ever truly predicted the return of a comet. The theory of the aberration of light will immortalize the name of Bradley; and the doctrine of increments will claim for its author, Dr. Taylor, a distinguished place amongst modern geometers. D'Alembert is deservedly celebrated for his extensive knowledge in elegant literature; while his theory of *partial differences*, and various other mathematical researches, cannot fail of placing him in the first rank of modern mathematicians. Euler's voluminous writings display in every part a superior and comprehensive

genius, and the clearness and perspicuity with which he treated the various branches of analysis and geometry, shew the solidity and accuracy of his judgment: in fact, if we consider Euler as an analyst and geometer, we cannot deny to him the honour which has been bestowed upon him by a celebrated author of the present day, *viz.* that he was one of the most extraordinary men that any age or country ever produced. To these names we might add those of Cotes, Maclaurin, Simpson, Cramer, Waring, and various others, but the limits of this article requires us to desist from any farther enumeration.

In the preceding pages, we have endeavoured to follow, as nearly as possible, the order of time in which the several discoveries and improvements were made, and, as far as we were able, to introduce all the most prominent parts of the history of mathematics, and the most celebrated of its professors; but in the short space that this article occupies, it must necessarily have happened that many distinguished names are omitted. To compensate for this, in some measure, we have framed the following biographical chart, which exhibits, under one point of view, the dates, names, and discoveries of all the most eminent mathematicians from the earliest period. Those who are more particularly celebrated are printed in Roman capitals, with the country in which they flourished, and that particular branch of mathematics in which they most excelled, or which they have invented or improved. Where there is nothing of a particular nature whereby an author is distinguished, his country only is given, and some general term, as astronomy, philosophy, mathematics, &c. to indicate to which branch of the sciences he more particularly directed his attention. But in the last four centuries, in order to make more room, such remarks are omitted, and the name only retained. This table might have been much more extended had our limits admitted of it; but it is presumed that few authors are omitted, who have contributed, in any considerable degree, to the advancement of those sciences.

MATHEMATICS.

Chronological TABLE of the most eminent Mathematicians from the earliest Period to the present Time.

Cent.	Beginning.	Middle.	End.
B.C.	CONFUCIUS, 722 B.C.	Era of Nabonassar, 747 B.C.	CHIRON the Centaur, 960 B.C.
600	THALES, Gr. Predict. an Eclipse. Anaximander, Gr. Celest. Globes.		
500	Cleoftratus, Gr. Astronomy.	Anaxagoras, Gr. Philosophy. Anaximenes, Gr. Sun Dial.	PYTHAGORAS, Gr. 47 Eu. Syst. Ast.
400	Euclemon, Gr. Astronomy. Meton, Gr. Metonic Cycle. PLATO, Gr. Geom. and Philos.	Hippocrates, Gr. Quad. of Lunes.	Ænopides, Gr. Geometry. Zonodorus, Gr. Geometry.
300	ARISTOTLE, Gr. Philosophy. Calippus, Gr. Astronomy. Dinocrates, Gr. Architecture. Theophrastus, Gr. Hist. and Math. Xenocrates, Gr. Architecture.	EUDOXUS, Gr. Geom. and Astron.	PYTHEAS, Gaul, Navig. & Astron. Archytas, Gr. Math. and Phil. Aristæus, Gr. Conic Sections. Dinostratus, Gr. Quadratrix. Menechmus, Gr. Geometry.
200	APOLLONIUS, Gr. Geometry and Conic Sections.	ARCHIMEDES. Aristarchus, Gr. Astronomy. Eratosthenes, Gr. Meas. a Degree.	EUCLID, Gr. Elem. Geo. & Optics. Aratus, Gr. Poet. and Astron. Aristillus, Gr. Phil. and Astron. Nichomedes, Gr. Conchoid.
100		HIPPARCHUS, Gr. Length of Year, N ^o the Stars. Ctesibius, Gr. Water Pumps. Hero, Gr. Hero's Foun. Clepsydra.	
° Christ. Era.	Manilius, Rom. Poet. and Astron. Manlius, Rom. Astronomy.	CÆSAR, JULIUS, Ref. the Calendar. Sofigenes, Egypt. Astronomy.	Pofidonius, Rom. Mech. and Math. Theodosius, Rom. Spherics.
A.D. °	Cleomedes, Rom. Astronomy. Geminus, Rhodes, Geom. & Astron. Vitruvius, Rom. Architecture.	Menelaus, Rom. Spher. Trigonom.	Jamblicus, Syria, Philosophy.
100	Frontinus, (Sixtus), Rom. Engin. Nicomachus, Gr. Mathematics.	Hypsicles, Gr. Mathematician. PTOLEMY, Claud. Egypt. Almag.	
200		Diophantus, Gr. Diophan. Analysis.	
300		Jamblicus, also of Syria, Philosophy.	Pappus, Gr. Geometrical Loci. Theon, Gr. Philosophy.
400	Hypatia, Daugh. of Theon, Com. on Diophan.	Proclus, Gr. Comment. on Euclid.	Diocles, Gr. Cissoïd. Serenus, Gr. Geometry.
500	Marinus, Naples, Geometry.	Anthemius, Rom. Archit. Domes. Eutocius, Gr. Geometry. Isidorus, Rom. Architecture.	
600	Alexandrian Library destroyed 642, A.D.		Beda, the Venerable, Engl. Monk.
700		Almanfor, the Victorious, Astron.	Hero, the Younger, Gr. Geometry,
800	Almaimon, Arab. Prince, Astron. Alrashed, Persia, Astronomy.	Alfragan, Arab. Astronomy.	Albategni, Arab. Astronomy. Thebit Ibn Chora, Arab. Astron.
900		(Gebert), Silvester II. Spain, Math.

MATHEO, Sr., in *Geography*, a town of Spain, in the province of Valencia; 27 miles S.S.W. of Tortosa.

MATHEPOUR, a town of Hindoostan, in Guzerat; 30 miles N.W. of Puttan-Sumnaut.

MATHER, INCREASE, in *Biography*, an eminent American divine, who flourished in the 17th and 18th centuries, was born at Dorchester, in New England, in the year 1635. He pursued his academical course of studies at Harvard college, in Cambridge, where he took his degree of B. A. in 1656. In the following year he made a voyage to England, and from thence he went to Ireland, and having a brother, minister to a congregation at Dublin, he entered himself of Trinity college, in which he proceeded M. A. in 1658, having performed the necessary exercises with great applause. He was not more distinguished for his talents than respected for the suavity of his manners and the rectitude of his deportment, and was offered a fellowship in that institution; but finding the climate of the island unfavourable to his health, he returned to England, and officiated for some time as minister, in the place of Mr. Howe, at Great Torrington, in Devonshire. Upon the return of the pastor to his flock, in 1659, Mr. Mather accepted an invitation to become chaplain to colonel Bingham, governor of the island of Guernsey, and preached every Sunday, as well before the garrison, as in the town of Peter le Port. When the time came that he was obliged to conform to the established religion, or quit his situation, he readily submitted to the latter, and returned to England. Here he might have had valuable church preferment, but he chose a clear-conscience to any thing that the world could offer, and failed for New England, where he was chosen minister to the New Church at Boston. Shortly after this, he married the daughter of Mr. John Cotton, a gentleman of considerable eminence in England, from whence he had been driven on account of his non-conformity. He had formerly been vicar of Bolton in Lincolnshire, in England, and was now settled as minister at Bolton in America. In 1664, Mr. Mather was ordained to the pastoral office, the duties of which he performed through life with credit to himself, and highly esteemed by his people. In the year 1683, when king Charles II. required the inhabitants of New England to surrender the charter, Mr. Mather attended at a meeting of the freemen of Bolton, and by his zealous persuasions determined them to reject a motion for that purpose unanimously, and to leave the issue to Providence, rather than become the degraded instruments of voluntarily sacrificing their liberties. This spirited measure had considerable influence in prevailing on the country in general to imitate the example set by the Bostonians. Upon the publication of king James' second declaration for liberty of conscience, some of the ministers of New England, and their churches, drew up addresses of thanks to him for the benefits which they enjoyed in consequence of it, and Mr. Mather proceeded to England for the purpose of presenting them. He was favourably received at court, and laid before the king the state of the country. While he continued in England, the revolution took place, and he was consulted by the new administration on many political topics, particularly on an attempt to obtain the resettlement of the Massachusetts colony, upon their chartered foundation, by an act of parliament, which was frustrated by its dissolution. He at length obtained from his majesty a new charter, containing the whole of the old one, with the addition of new and more ample privileges. Having rendered this important service to his fellow citizens, he set sail for America in 1692, and on his return he received the public thanks of the house of representatives for his faithful and zealous endeavours to

benefit his country. He now returned to his labours in the church, and at Harvard college, of which he was chosen president in 1684, and also created doctor of divinity. He died in 1723, at the age of 84. He was author of many theological tracts: of "A brief History of the War with the Indians in New England;" of "An Essay for the recording of illustrious Providences, wherein an account is given of many remarkable and memorable events which have happened in this last age, especially in New England;" of "A Discourse on Comets;" "A Discourse concerning Earthquakes, &c."

MATHER, COTTON, son of the preceding, was born at Boston in 1662-3, and was, while very young, distinguished by his great proficiency in the learned languages. At twelve years of age he was thought to be well qualified; by his previous knowledge, for entering on academical studies, and was accordingly admitted to Harvard college, where, in a very short time, he surpassed his contemporaries in the different branches of literature and science. Before he was twenty years of age he had taken his degrees of B. A. and M. A. He now undertook the office of tutor, which he retained with great reputation for the space of about seven years, and he had, afterwards, the satisfaction of seeing several of his pupils become eminent characters in the church and the world. In early life he was afflicted with a stammering, or impediment in his speech; but by great attention and care he overcame the defect, and engaged in the services of the pulpit in the year 1680. He was first elected as assistant to his father in the church at Bolton; and in 1684 he was ordained as co-pastor. He was indefatigable in every duty in which he engaged; and to render himself more extensively useful, he applied to the study of the modern languages, and made himself master of the Iroquois Indian tongue, so that he was able to write and publish treatises in each of these languages. He was frequently consulted on matters of state by the magistrates, and more than once succeeded in quelling dangerous riots by the force of his persuasion. In one thing, however, he was strangely misguided by the prejudices of the times in which he lived; he believed in the powers of witchcraft, and joined in the persecutions that were carried on in that country, against some poor creatures who had incurred the displeasure of their neighbours on this head. He contributed to promote the phrenzy of the time by publishing the trials of the accused, and by some other writings in support of the absurd and pernicious doctrine of witchcraft. In every other respect he was uniformly influenced by a most disinterested regard for the public good: he planned and promoted several useful institutions, and he was an active member of a society whose professed business was to compose differences and prevent law-suits. He was a commissioner for Indian affairs, and exerted all his powers to promote the instruction and happiness of the native inhabitants. He was the first person that introduced the practice of inoculation for the small-pox into America. His fame was not confined to his own country; but his merit was known and acknowledged in distant parts. In 1710, the university of Glasgow conferred on him the degree of doctor in divinity, and in 1714 the Royal Society of London elected him one of their body. He died in 1727-8, when he had completed his sixty-fifth year, leaving behind him a character for great piety and benevolence; he was as a man and a member of society, polite, friendly, and a most entertaining as well as instructive companion. He published nearly four hundred distinct pieces, many of which were, of course, very small, such as single sermons, essays, &c. Among these, we may notice "Magnalia Christi Americana; or, An Ecclesiastical History of

New England from its first planting in 1620 to 1698;" "The Wonders of the Invisible World; being an account of the trials of several witches lately executed in New England, and of several remarkable curiosities therein occurring;" "Johannes in Eremo; or, The Lives of several famous Divines;" and "India Christiana; or, An Account of the Propagation of Christianity in the East and West Indies." Our author, during a great part of his life, was honoured by an epistolary correspondence with several persons of eminent character for piety and learning, and among others with that of lord chancellor King, lord Barington, Mr. Whiston, M. Desaguliers, and the celebrated doctor Franke, professor of divinity in the university of Halle in Saxony. *Biog. Brit.*

MATHIEU, *St.*, in *Geography*, a town of France, in the department of the Upper Vienne, and chief place of a canton, in the district of Rochechouart; 12 miles S.S.W. of St. Junien. The place contains 1946, and the canton 9699 inhabitants, on a territory of 252½ kilometres, in 10 communes.

MATHRAVEL, a village of North Wales, in the county of Montgomery; once the seat of the prince of Powis, and supposed to be the ancient city called "Mediolanum," now reduced to a farm-house; five miles N.W. of Welshpool.

MATHURINS, in *Ecclesiastical History*, a name given to the brethren of the Holy Trinity, from their having a monastery at Paris, erected in the place where there is a chapel consecrated to St. Mathurin. See TRINITARIANS.

MATHUSEN, or MAUTHAUSEN, in *Geography*, a town of Austria, situated on the Danube; seven miles E. of Steyregg.

MATIANA, in *Ancient Geography*, a country of Asia, between Armenia and Media; called by Strabo the Martianane of Media.

MATIAS, *St.*, in *Geography*, a town of New Navarre; 150 miles W. of Casa Grande.

MATICA, *St.*, a town of Russia, in the government of Revel, on the gulf of Finland; 20 miles N.E. of Revel.

MATICALÁS, a river on the W. coast of New Mexico; seven leagues from Catelatrán, or the port of Sanfonate, known by some high but small hills that are opposite to it, and much exposed to northerly winds.

MATIGNAN, a town of France, in the department of the North Coasts, and chief place of a canton, in the district of Dinan; 14 miles N.W. of Dinan. The place contains 996, and the canton 8894 inhabitants, on a territory of 200 kilometres, in 11 communes.

MATILDA, or MAUD, in *Biography*, empress of Germany, and queen of England, daughter of Henry I. king of England, and Matilda of Scotland, was born in 1102. At eight years of age she was betrothed to Henry V. emperor of Germany; and was sent over to that country for education. The emperor dying, without issue, in the year 1125, Matilda returned to the court of her father, who, having lost his only son, caused all the nobles, prelates, &c. to swear fealty to her as his successor, in case he should die without male issue; and in 1127 he married her to Geoffrey, eldest son of Fulk, count of Anjou. She now went to reside in Normandy, and in 1132 she was delivered of a son, afterwards Henry II; and by the death of her father, in 1135, she became heiress of all his dominions in England and France. She was then residing at Anjou with her husband, of which circumstance Stephen, earl of Blois, took advantage, and seized upon the crown of England. The barons of Normandy followed the example of the English in submitting to Stephen, so that Matilda was almost instantly

deprived of the inheritance which her father had attempted to secure for her. The government of Stephen was soon hated, and Matilda, in 1139, landed in England, and a number of the most powerful barons, without hesitation, declared in her favour. A civil war ensued, and, in 1141, Stephen was taken prisoner, and Matilda was crowned queen of England in the cathedral of Winchester. She was naturally of a haughty disposition, and, overset with her good fortune, she refused to listen to the requests of her nobles, and insolently rejected the petition of the Londoners for the restoration of the laws of Edward the Confessor. Conspiracies were formed to seize her person, but she escaped the machinations of her subjects, and withdrew to Normandy in the year 1148, where she spent the remainder of her days. She died in 1167. *Hume.*

MATILDA, countess of Tuscany, the daughter of Boniface, marquis of Tuscany, celebrated for her attachment to the papal see, was born, according to some accounts, in 1039, and, according to others, in 1046. She first married Godfrey le Bessu, son of the duke of Lorraine, but lived almost entirely apart from him, not chusing to follow him from Italy to a ruder climate. Godfrey died in 1076, and in the same year, by the death of her mother Beatrice, she succeeded to vast possessions in Italy. She now put herself entirely under the direction of Gregory VII. espoused his cause with all the zeal of a partizan, and in the year 1077 she made a reverend grant of all she possessed to the church, to the prejudice of the emperor, Henry IV., to whom they would have devolved on her death. She assisted the pope with all the forces she could raise, and several times appeared in person at their head. After the death of Gregory, in 1085, Matilda still continued to give her support to the Roman see under his successors, Victor III. and Urban II. In 1089, she married, a second time, Guelf, son of the duke of Bavaria, a distinguished leader in the party adverse to the emperor. Matilda died in 1115, having solemnly confirmed her dominions to the holy see. The popes, however, were not able quietly to take possession of those vast estates; and the contest for them was the source of long continued wars between them and the emperors. A part only of the donation finally took effect; nevertheless, Matilda is justly regarded by the votaries of the holy see as the greatest temporal benefactor it ever possessed. This circumstance has rendered her a subject for extravagant panegyric with one party, and for very scandalous imputations with the opposite. *Univer. Hist.*

MATILDA, in *Geography*, a township of Upper Canada, in the county of Dundas, being the sixth township in ascending the river St. Lawrence; a few miles N.W. of Oswegatchie.

MATILLA, a town of Spain, in the province of Leon; 20 miles S.S.W. of Salamanca.

MATIN, a river of Canada, which runs into the St. Lawrence; 150 miles below Quebec.

MATINS. See MATTINS.

MATINA, in *Geography*, a town of Mexico, in the province of Costa Rica; 60 miles N.N.E. of Carthage.

MATINATA, *Ital.*, a lover's morning song, under the window of his mistress. The *Crusca* dictionary defines it, "Composizione da cantare e sonare, che fanno gli amanti in sul mattino davanti alla casa della innamorata; come serenata quel che fanno la notte al sereno;" a composition sung and played by a lover in a morning, under the window of his mistress; as a *serenata* is performed in a similar manner in the evening. See SERENATA.

MATINICUS ISLANDS, in *Geography*, islands of America, on the coast of Maine. Matinicus lies in N. lat. 43° 56'. W. long. 68° 20'.

MATINO,

MATINO, a town of Naples, in the province of Otranto; 10 miles E. of Gallipoli.

MATISFALVA, a town of Transylvania; seven miles E.S.E. of Samofvivar.

MATITES, in *Natural History*, the name of a stone described by several authors. The characters they give of it are, that it is of a pale greyish colour, and of the form of the nipples of a woman's breasts, several of these nipples appearing upon one stone.

It is plain, that there needs no more to the formation of one of these matitæ than the petrification of a piece of the shell of one of the *echini marini*, or sea-eggs, which have large papillæ, such as those of the Red sea, with some of its papillæ upon it. As to the colour, it is not to be limited to grey alone, but may be various as the colours of stones, since any species of stone may have gone to the formation of it; and whatever colour the stony matter was, of that will the matites be.

MATKNELTZEL, in *Ornithology*, the name of a bird approaching to the snipe kind, and called by Gesner *gallinula erythra*; and by the common people of Germany, *matkern*. It is common in watery places in many parts of Germany and Italy. See **FULICA maculata**.

MATLOCK, in *Geography*, a village and parish in the wapentake of Wirksworth, Derbyshire, England, is situated on the eastern banks of the river Derwent, 17 miles distant from Derby, and 143 from London. At the time of compiling the Domeſday book, it was a hamlet of the manor of Metesford, which was part of the demefnes of the crown. It was afterwards held by William de Ferrers, earl of Derby, but on the attainder of his son Robert reverted to the crown; and being granted by Edward I. to Edmund earl of Lancaſter, continued a part of that earldom and duchy till the reign of Charles I., when it was sold to the copyholders of the manor, and is now divided into small shares. According to the return made under the population act of 1800, this parish contained 492 houses, occupied by 2354 persons. The inhabitants are chiefly employed in the neighbouring lead mines, and in the manufacture of cotton. The houses are principally of stone; and at the entrance of the village is a neat stone bridge. The church, which stands on the verge of a romantic rock, consists of a nave, side aisles, and a small chancel. On the eminence called Riber, are the remains of a druidical altar, or cromlech, called the *Hirſl ſtones*. It is composed of four masses of grit-stone, one of which, apparently the smallest, is placed on the others, and is computed to weigh about two tons. On this upper stone is a circular hole, six inches deep, and nine in diameter, wherein, till about the middle of the last century, stood a stone pillar.

About a mile and a half from the village is Matlock-bath; which, though few situations can be more beautiful, was only occupied by some rude cottages inhabited by miners, till its warm springs began to attract notice, for their medicinal qualities, about the year 1698. At that period the original bath was built, and a house also built for the accommodation of visitors. A second spring having been discovered, a new bath and lodging-house were erected. At a later period, a third spring was found; another bath and house were consequently built; the latter, by various alterations, is become one of the most commodious hotels in England. These buildings are of stone, and are respectively named, the Old Bath, the New Bath, and the Hotel. In these, and two private lodging-houses, five hundred persons may at the same time be accommodated. The Matlock season commences at the end of April, and continues till November.

The scenery of Matlock dale is peculiarly romantic and picturesque; being diversified with rugged rocks contrasted with the finest verdure. Two of these rocks, the High Tor, and Masson hill, are worthy of notice. The former is upwards of 350 feet in height; the lower part is covered with small trees and underwood of various foliage; but the upper part, for fifty or sixty yards, is one broad mass of naked perpendicular rock. The fragments that have fallen from it form the bed of the river which flows immediately below. After heavy rains, the impetuosity of the current is greatly increased, and the sublimity of the view proportionably augmented. Opposite to the High Tor, but rising with a gentler ascent, though to a greater elevation, is Masson hill, which appears like a pile of immense craggs. The summit of this mountain has been named the Heights of Abraham, and overlooks the country to a vast extent, besides commanding a beautiful bird's-eye view of nearly the whole dale. The height of this stupendous eminence is about 250 yards; the path to its summit has been carried in a winding or rather zigzag direction, and in various places has been planted with rows of firs, which opening at convenient distances, admit the eye to range over the scenery beneath, from different points of view. Near the upper end of the dale is a spacious building, erected for the manufacture of cotton, by the late sir Richard Arkwright, and now the property of his son Richard Arkwright, esq., whose elegant mansion, Willersley castle, stands on the south side of a commanding eminence, which terminates the extensive range of rocks that forms the eastern boundary of the Derwent, in its course through Matlock dale. The castle consists of a body, in the form of an oblong square, having a circular tower rising from the centre of the roof, and a semicircular tower projecting from the front on each side of the entrance, and two wings with a round tower at each angle; the whole structure is embattled, and the walls are of free-stone. Beauties of England and Wales, vol. iii.

MATLOCK Waters. See **MATLOCK WATERS**.

MATMAI, one of the Kurile or Kurilskoi islands, the southernmost and largest, subject to the Japanese, and fortified and garrisoned on the side toward the continent. The channel between this island and Japan is said to be no more than 60 versts wide, and full of rocks. The current is very rapid. On the southern promontory stands the Japanese town Matmai, where the supreme commander resides. The hairy Kurils are in possession of the inland parts of the island. The Japanese and Chinese resort hither in trading vessels for the purposes of commerce, which consists in bartering with the Kurils for sea-otters, seals, and various sorts of furs; also fat, oil, and blubber of whales, and other marine animals; eagles' feathers for flogging their darts and arrows, and other articles, in exchange for silk and cotton pieces for garments, japanned vessels, rice, brandy, tobacco, sabres, knives, pots, and kettles, hatchets, and the like. In the region of the bay Atkiss, the land extends northward in a great headland, where lofty mountains rise on all parts, tending eastward in ridges: within land are spacious vales between the mountains, and large rivers roll in currents to the sea. The coast abounds in bays and bights, which might be made to serve for harbours. The forests consist of oaks, beech, elm, birch, willow, and other trees of unknown species. The fields produce a multitude of unknown vegetables, among which are strawberries, cranberries, bilberries, and a large sort of hips and haws. Of animals, the forests afford haunts to black bears, elks, roebucks, deer, sables, foxes, hares, and river-otters. The bays and inland lakes swarm with all kinds of ducks and water-fowl; nor is the country deficient in frogs and snakes.

MATO, in *Natural History*, the name of a tree growing both in the East and West Indies, and bearing a fruit of the size of an apple, and covered with a thick and tough red skin. This is called by some the wild mangoutan. Its fruit perfectly resembles that of the mangouilan in figure, but is not eatable. Mem. Acad. Par. 1699.

MATO Dentoo, in *Geography*, a town of Brasil, in the government of Minas Geraes; 45 miles N.N.E. Villarica.

MATOBLOLO, one of the smaller Philippine islands, near the N. coast of Panay. N. lat. $11^{\circ} 56'$. E. long. $122^{\circ} 45'$.

MATOCHEK SCHER, a strait which divides Nova Zembla, always filled with ice. N. lat. 75° .

MATOGROSSO, or **MATTO-GROSSO** the most inland, and the most celebrated province of Brasil. According to Alcedo, the Portuguese first took possession of it in 1761, having discovered the richness of its gold mines, by means of the Missionaries, to whose pious and benevolent labours we are chiefly indebted for the discovery of the interior parts of Cabralia, or as it is called by the Portuguese, Land of the Amazons, though widely remote from the river idly so called. A town was erected, and a governor appointed. As in mining stations in general, the land is barren, and provisions scarce and dear. The climate is hot and moist. It was in vain attacked in 1766, by orders of the viceroy of Peru, the Spaniards being obliged to retreat by the difficulty of the route, and the valour of the Portuguese. S. lat. 10° to 23° . W. long. 52° to 64° .

MATOMKIN, GREAT and LITTLE, two small islands in the Atlantic, near the coast of Virginia; the former in N. lat. $37^{\circ} 42'$. W. long. $75^{\circ} 36'$, and the latter in N. lat. $37^{\circ} 38'$. W. long. $75^{\circ} 42'$.

MATONBACKRAPETTA, a town of Hindoostan, in the circar of Cuddapa; 32 miles S.S.E. of Cuddapa.

MATOON HARBOUR, a harbour on the southern coast of Nova Scotia. N. lat. 44° . W. long. $64^{\circ} 45'$.

MATOUR, a town of France, in the department of the Saône and Loire, and chief place of a canton, in the district of Macon; 13 miles W. of Macon. The place contains 2062, and the canton 6378 inhabitants, on a territory of $152\frac{1}{2}$ kilometres, in nine communes.

MATOUREA, in *Botany*, a plant so called by Aublet, and figured in his Guian. t. 259, appears to be properly referred by Schreber to **VANDELLIA**. It is known to the Creoles by the name of *Basilic sauvage*, or Wild Basil, having the foliage of an *Ocimum*, with a bitterish, somewhat aromatic, flavour, and is used, either bruised or in decoction, as a vulnerary, being considered very efficacious in that respect. It is a native of meadows in Cayenne and Guiana, flowering all the year round. The root is annual. Stem two feet high, much branched, square, leafy, slightly downy. Leaves opposite, an inch long, ovate, serrated, downy, paler beneath; elongated and entire at the base. Flowers axillary, blueish, generally solitary. We are not informed of the derivation of the above name, nor whether the French *Matouri* be the original or the translation.—This plant is the *Vandellia pratenfis* of Vahl, as well as of Willd. Sp. Pl. v. 3. 343, and is said to be extremely common in South America, by road sides, from the island of Trinidad to the Brasils. See **VANDELLIA**.

MATRA, in *Geography*, a chain of mountains in Hungary, S.W. of Erlau.

MATRAMODO, a town of Hindoostan, in the Carnatic; 27 miles W. of Vellore.

MATRASS, **MATRACIUM**, or *Bolt-head*, a glass vessel, used by chemists in digestions, and other operations.

The matrass is made in form of a bottle somewhat bellied

in the middle, with a long narrow neck; it is coated with earth, when it is to be placed on a very hot fire. And when it is required it should be stopped very close, they seal it hermetically.

The matrass, used in assaying, is a vessel of very pure and transparent glass, not too thick at the bottom, which would make it apt to burst in the fire. It is, for this use, to be about eight or ten inches high, and to have an orifice scarcely so much as half an inch wide, lest the matters contained in it, being in a violent state of ebullition, should either rise over the mouth of the vessel, or at least be partly thrown out in form of small drops, like a thin rain, which drops always carry some of the metal with them. The bottom is capacious enough when it will hold an ounce or two of aquafortis, and the height of the vessel is of a farther use in making a greater repercussion of the fumes. The mouth ought also to be turned backwards, in form of a broad lip, that the solutions, when poured out, may not run down the sides of the vessel. Cramer, Art of Ass. p. 68.

Matrasses are also used as receivers: as to their form, some are spherical, others flattened at the bottom, and others in the shape of an egg, called *philosophical eggs*. The most convenient of all, when only a small quantity of matter is used, are bottles of thin glass, called medical phials; because they are cheap, made of good glass, and may be quickly heated, so that the liquor contained in them shall boil without danger of being broken. See **LABORATORY**.

MATRAY, in *Geography*, a town of the Tyrol; 10 miles S. of Inspruck.

MATRI, among *Hindoo Mythologists*, is a term applied to several of their female divinities, or divine mothers, the meaning of the word. It seems nearly the same as Sakti, which, however, is generally stated to mean the active energy of a power, rather than a mother. (See **SAKTI**.) In the eighth volume of the Asiatic Researches, Mr. Paterfon enumerates eight of these Saktis, as follows:

1. Maheswari, the Sakti of Mahesa or Siva.
2. Saraswati; in this character, indeed, more correctly called Brahmi or Brahmani, Sakti of Brahma.
3. Narayani of Narayana.
4. Indrani, or Aindri, of Indra.
5. Kaumari of Kartikya.
6. Varahi of Vishnu, in the Varahavatara.
7. Narasinh of Vishnu, in the Narasingavatara. (Of all these due mention is made under their several names.)
8. Aparajita, a form of Bhavani, the female principle. The last, Mr. Paterfon remarks, may be the Aphrodite of the Greeks; and Maheswari, or a female Siva, riding on a white bull, may have given rise to the story of Europa's rape, while Brahmi, or the female Brahma, with the swan, may, in like manner, have occasioned the fable of Jupiter and Leda. These explanations were, perhaps, invented by the Greeks, to account for symbols, of the meaning of which they were ignorant. On the foregoing passage, Mr. Colebrooke, the worthy successor of sir William Jones in the chair of the Asiatic Society, gives, in a note, the following information. "The eight Saktis, or energies of as many deities, are also called Matris, or mothers. They are called Brahmi, &c. because they sprung from the bodies of Brahma, and the other gods respectively. In some places they are thus enumerated: Brahmi, Maheswari, Aindri, Varahi, Vaishnavi, Kaumari, Chamunda, and Charchika. Some reduce the number to seven; omitting the two latter; and adding Kauveri (which see.) Prayers are addressed to the Matris on various occasions, especially in the Cavachas, or defensive incantations. (See **MANTRA**.) Two are cited by way of example, and an extract from the Marcandeya Purana, descriptive of these goddesses. "May Brahmani, conferring the benefit of all benedictions, protect me on the east;

east; and Narayani on the south-east, for the sake of realizing every wish; Maheswari too on the south, rendering every thing auspicious; Chamunda on the south-west, discomfiting all enemies; and on the west Kaumari, armed with her lance and slayer of foes; on the north-west, Aparajita, the beautiful giver of victory; on the north Varahi, granter of boons; and on the north-east Narasimhi, the banisher of terror. May these mothers, being eight deities and active powers, defend me." Another incantation simply enumerates the same eight goddesses, and proceeds thus: "May these, and all Matris, guard me with their respective weapons on all quarters, and on every point." In the Devi Mahatmya, the assembling of the Matris to combat the demons is described, and we shall extract the passage, with some others, as descriptive generally of the principal female divinities of the Hindoos, and throwing some light on an obscure, but interesting, branch of the mythology of that, and we may safely say of other, people. "The energy of each god, exactly like him, with the same form, the same decoration, and the same vehicle, came to fight against the demons. The Sakti of Brahma, girt with a white gourd, arrived on a car yoked with swans; her title is Brahmani. Maheswari came riding on a bull, and bearing a trident, with a vast serpent for a ring, a crescent for a gem. Kaumari, bearing a lance in her hand and riding on a peacock. Vaishnavi also arrived, sitting on an eagle, and bearing a conch, a discus, a club, and a bow and a sword in her several hands. The energy of Hari, who assumed the unrivalled form of the holy boar, likewise came there, assuming the body of Varahi. Narasimhi too, embodied in a form precisely similar to that of Nrisimhi, with an erect mane reaching to the hoofs of its. Aindri, came, bearing the thunder-bolt, and riding on the king of elephants, and in every respect like Indra, with a hundred eyes. Lastly, came the dreadful energy named Chandika, who sprung from the body of Devi, horrible, howling like a hundred shakals; she, surnamed Aparajita, the unconquered goddess, thus addressed Hani, whose head is encircled with his dusky-braided locks."—"Thus," continues the story, which is too long for insertion, "did the wrathful host of Matris slay the demons."

In the Utara kalpa of the same Purana, the Matris are thus described: "Chamunda standing on a corpse; Varahi sitting on a buffalo; Aindri mounted on an elephant; Vaishnavi borne by an eagle; Maheswari riding on a bull; Kaumari conveyed by a peacock; Brahmi carried by a swan; and Aparajita revered by the universe, are all Matris endowed with every faculty."

The probability of these and similar Puranic legends having been the origin of those of Aphrodite, Europa, and Leda, is above hinted. A farther consideration of the passages quoted might lead to a belief of greater identity in the mythology of the eastern and western heathens. A virgin goddess conveyed by a peacock, a hundred-eyed deity, and one borne by an eagle, are common to both. Other points of uniformity will occur to the classical reader.

In the thirteenth section of the first book of the Ramayana (see that article), the company assembled at an Aswamedha, or sacrifice of a horse, is enumerated; including, among many other of the heavenly host, "the four supporters of the universe, and the divine mothers of all the celestials." A note on this passage informs us, that the former are "Indra, regent of the east; Yama, of the south; Varuna, of the west; and Kuvera, of the north." (See hereon more particularly under MARUT.) And that the "divine mothers of the celestials are seven: Brahmi, Ma-

heswari, Rudri, Kaumari, Vaishnavi, Varahi, and Indrani."

MATRICARIA, in *Botany*, so called from its reputed efficacy in diseases of the matrix. Its Greek synonym *ματρίκαρα*, from *ματρίκα*, a virgin, seems to be founded in a similar opinion. Linn. Gen. 432. Schreb. 565. Willd. Sp. Pl. v. 3. 2161. Mart. Mill. Dict. v. 3. Sm. Fl. Brit. 902. Ait. Hort. Kew. ed. 1. v. 3. 233. Juss. 183. Lamarck Illustr. t. 678. Gærtn. t. 168.—Class and order, *Syngenesia Polygamia Superflua*. Nat. Ord. *Compositæ Discoidæ*, Linn. *Corymbifera*, Juss.

Gen. Ch. *Common calyx* hemispherical, composed of linear, imbricated, nearly equal, membranous scales. *Cor.* compound, radiated; florets of the disk all perfect, tubular, funnel-shaped, five-cleft, spreading; those of the radius female, oblong and three-toothed. *Stam.* (in the tubular florets) Filaments five, capillary, very short; anthers cylindrical, tubular. *Pist.* (in the tubular florets) Germen oblong, naked; style thread-shaped, the length of the stamens; stigma cloven, spreading; the female or ligulate florets differ in having rather a shorter style, and two revolute stigmas. *Peric.* none, except the permanent calyx. *Seeds* in all the florets solitary, oblong. *Down* none. *Recept.* naked, cylindrical or conical.

Obf. This genus differs from *Pyrethrum* in having no *crown* or *pappus* attached to the seed.

Eff. Ch. *Receptacle* naked, almost cylindrical. *Seeds* without a crown. *Calyx* depressed, imbricated with membranous bordered scales.

1. *M. juveolens*. Sweet Feverfew. Linn. Sp. Pl. 1256. (*M. recutita*; Linn. Sp. Pl. ed. 1. 891. Fl. n. 701; Fl. Suec. ed. 1. 251, without the synonyms.)—"Receptacle conical. Florets of the radius deflexed. Calyx-scales equal at the margin."—Native of Sweden, but of what country besides is uncertain, this being a very obscure species, much mistaken by authors. The Linnæan herbarium throws no certain light upon it. What Ehrhart has given in his *Plantæ Officinales* 58, as *Matricaria Chamomilla*, seems rather to answer to the description of the species in question.

2. *M. Chamomilla*. Corn Feverfew, or Wild Chamomile. Linn. Sp. Pl. 1256. Engl. Bot. t. 1232. Curt. Lond. fasc. 5. t. 63. Mart. Fl. Ruft. t. 74.—Leaves smooth, pinnated; leaflets linear, simple or divided. Radius spreading. Scales of the calyx dilated.—Very common in the neighbourhood of London, in fields and on dunghills by the road side, flowering from May to July.—*Root* annual, fibrous. *Stem* a foot high, erect, very much branched, leafy, striated, smooth. *Leaves* sessile, pinnated, clasping the stem, of a deep green, smooth; leaflets linear, obtuse with a little point. *Flowers* numerous, terminal, solitary, resembling those of the Chamomile of the shops (*Anthemis nobilis*) in size, and, in a certain degree, in smell. *Calyx* flattish, smooth; scales dilated outwardly, membranous, whitish. *Disk* yellow, conical. *Florets of the radius* spreading, white, refuse, three-toothed, deflexed in the evening. *Seeds* angular, oblique, smooth, altogether beardless. *Receptacle* conically cylindrical, acute, dotted, smooth.

Hudson and Lightfoot were of opinion that *M. juveolens* of Linnæus was only a variety of this species, but Dr. Smith in his *Flora Britannica* says they are distinct, the former being never found in Britain, and having its flowers not more than half as large as in the latter.—Professor Martyn observes that "according to the Swedish observations, kine, goats and sheep eat this plant, horses are not fond of it, and swine refuse it. It seems to be rejected in general by all quadrupeds with us. It is supposed to possess the

the same qualities with *Anthemis nobilis*, but in an inferior degree."

Willdenow has adopted a third species, *M. capensis*, on the authority of Thunberg's *Prodromus* and Linnæus's *Mantissa*; but on referring to the Linnæan Herbarium, we find its seeds furnished with a crown, so that it must of course be removed to *Pyrethrum*. For the same reason *M. Parthenium*, and *maritimum* have been placed under that genus.

MATRICARIA, in *Gardening*, comprehends plants of the hardy, herbaceous, perennial kind, of which the species cultivated is the common feverfew (*M. parthenium*.)

It has several varieties, as with full double flowers, with double flowers, having the florets of the ray plane, of the disk fistular; with very small rays; with very short fistular florets; with naked heads, having no rays; with naked sulphur-coloured heads, and with elegant curled leaves.

Method of Culture—The plants of this species may be raised from seeds, by parting the roots, and by cuttings.

In the first mode the seeds should be sown in the spring, as about March, upon a bed of light earth, and when they are come up, planted out into nursery-beds, at about eight inches asunder, where they may remain till the middle of May; when they should be taken up, with a ball of earth to their roots, and planted in the middle of large borders, or other parts for flowering. But they should not be permitted to seed, as it often weakens and decays the roots; therefore, when their flowers are past, their stems should be cut down, which will cause them to push out fresh heads, whereby the roots may be better preserved.

MATRICE, or **MATRIX**. See **MATRIX**.

MATRICE, or *Matrix*, in *Dyeing*, is applied to the five simple colours, whence all the rest are derived or composed. These are the black, white, blue, red, and yellow or root-colour. See **DYEING**.

MATRICE, or *Matrices*, used by the *Letter-founders*, are those little pieces of copper or brass, at one end whereof are engraven, dent-wise, or *en creux*, the several characters used in the composing of books.

Each character, virgula, and even each point, in a discourse, has its several matrix; and, of consequence, its several puncheon to strike it. They are the engravers on metal that cut or grave the matrices.

When types are to be cast, the matrice is fastened to the end of a mould, so disposed, as that when the metal is poured on it, it may fall into the creux or cavity of the matrice, and take the figure and impression thereof. See **Letter-FOUNDERY**.

MATRICES, used in *Coining*, are pieces of steel, in form of dyes, whereon are engraven the several figures, arms, characters, legends, &c. wherewith the species are to be stamped.

The engraving is performed with several puncheons, which being formed in relievo, or prominent, when struck on the metal, make an indented impression, which the French call *en creux*. See the manner hereof under **ENGRAVING on steel**. See also **COINING**.

MATRICULA, a register kept of the admission of officers, and persons entered into any body or society whereof a list is made. Hence those who are admitted into our universities are said to be matriculated.

Among ecclesiastical authors, we find mention made of two kinds of matriculæ; the one containing a list of the ecclesiastics, called *matricula clericorum*; the other of the poor submitted at the expence of the church, called *matricula pauperum*.

MATRICULA was also applied to a kind of alms-house, where the poor were provided for. It had certain revenues appropriated to it, and was usually built near the church; whence the name was also frequently given to the church itself.

MATRIMONY. See **ESPOUSALS**, and **MARRIAGE**.

MATRIX, in *Anatomy*, the womb, or that part of the female of any kind, wherein the fœtus is conceived, and nourished till the time of its delivery. See **WOMB**, **UTERUS**, **FŒTUS**, &c.

MATRIX, *Bearing down of*, in *Surgery*. See **PROLAP-SUS**.

MATRIX, *Polypi of*. See **POLYPUS**.

MATRIX, *Retroversion of*. See **RETROVERSION**.

MATRIX, *Suffocation of the*. See **SUFFOCATION**.

Speculum MATRICIS. See **SPECULUM**.

MATRIX is also applied to places proper for the generation of vegetables, minerals, and metals.

Thus, the earth is the matrix wherein seeds sprout; and marcasites are by many considered as the matrices of metals.

The matrix of ores is the earthy and stony substances in which these metallic metals are enveloped: these are very various, frequently spar, quartz, fluors, or hornblende.

MATRIX Succini, in *Natural History*, a name given by Hartman, and some other authors, to a sort of substance resembling fossil wood, or the barks of trees, common in the coasts of the shores of the Baltic, and found in digging all over Prussia. This is the bed in which the fossil amber of that kingdom is lodged, and it is supposed to have no small share in the production or formation of that fossil. The workmen who dig for amber always make this their guide, and follow the veins of it, never searching any where else for the amber.

The fossil wood, which is truly such, and has been once vegetable matter, whatever part of the world it is found in, agrees in the same general marks of distinction; and knots, and other evident proofs of its having been once vegetable, are found in all of it; but this matrix of amber, whether found in Prussia, Denmark, or elsewhere, is still of the same kind, and shews none of these characteristic marks of wood. However, notwithstanding all this, it is said, that on opening the ditches for the fortifications at Copenhagen, several large masses of amber were found, all of them adhering to the sides of large bodies of trees, which were black as ebony. The pieces are preserved in the cabinet of the king of Denmark, in that place, and some of them weigh forty or fifty ounces. This is an additional circumstance to the common observation of something resembling wood being always found where amber is, and deserves to be considered, as it tends to overthrow the present received system of amber being originally a mineral production.

Dr. Fothergill, in his *Essay upon the Origin of Amber*, maintains, that it is a vegetable resin, the product, perhaps, of the fir or pine kind; and that it is changed into its present form by a mineral acid. In proof of its resinous nature, he alleges its aspect, texture, and form: besides, the bodies inclosed in it are mostly animals of the flying kind, few reptiles, except such as ants, spiders, &c. which are found in trees, and scarcely ever any aquatics; and this could not happen in the sea, nor in the earth, but upon its surface. He apprehends, likewise, that this resin, with the trees which afforded it, were buried in the earth by the deluge, or some violent convulsion of the same kind: to which purpose he observes, that the substance of which the proper veins of amber consist, hath several genuine characteristics of wood still remaining; the texture of amber, which is fibrous, and, when dried,

dried, capable of swimming in water, and burning like other wood, shews, he says, what it hath been. Nor is the amber disposed in these veins in one continued stratum; but lumps of it are irregularly disseminated through the whole of the supposed woody mass. The change which this wood undergoes, is produced partly by time, and completed by the vitriolic mineral acid of the earth. Such an acid, it is argued, is present wherever amber occurs in its proper matrix, and is sometimes found in the amber itself. The acid of the salt of amber is vitriolic; and common turpentine affords, by proper management with a vitriolic acid, a considerable portion of the same chemical principles that amber does; and those pieces of amber which have been found soft and imperfect, are nearly related to a vegetable resin. Phil. Transf. vol. xliii. N^o 472. p. 21.

MATRIX is, also applied figuratively to several things wherein there appears a kind of generation, and where certain things seem to acquire a new being, or at least a new manner of being. Of which kind are the moulds wherein the printers' types, or letters, are cast; and those used in striking money and medals, in coining. See MATRICE.

MATRON, MATRONA, among the Romans, signified a married woman, and sometimes also the mother of a family. There was, however, some difference between *matrona* and *mater-familias*. Servius says, that some imagined the difference to lie in this, that *matrona* was a woman who had one child, and *mater-familias* one that had several. But others, particularly Aulus Gellius, take the name *matrona* to belong to a married woman, whether she had any children or not; the hope and expectation of having them being enough to warrant the title of mother, *matrona*, and for this reason it is, that marriage is called *matrimony*. This opinion is supported by Nonius.

MATRON of an Hospital. See HOSPITAL.

MATRONS, *Jury of*, is a jury of twelve discreet women, directed by the judge to enquire into the fact when a woman is capitally convicted, and pleads her pregnancy. This plea, though it cannot be made in stay of judgment, may be urged in respite of execution. If the jury bring in their verdict quick with child, execution shall be staid generally to the next session; and so from session to session, till either the woman is delivered, or proves, by the course of nature, not to have been with child at all. But if she once hath had the benefit of this reprieve, and been delivered, and afterwards becomes pregnant again, she shall not be entitled to the benefit of farther respite for that cause; for she may now be executed before the child is quick in the womb, and shall not, by her own incontinence, evade the sentence of justice.

If a widow feigns herself with child, in order to exclude the next heir, and a suppositious birth is suspected to be intended, then upon the writ *de ventre inspiciendo*, a jury of women is to be impanelled to try the question; Whether with child or not?

MATRONALIA, feasts of the Roman ladies, or rather matrons, celebrated on the calends of March, in honour of the god Mars.

Ovid mentions many reasons for the institution of this feast; but the principal seems to have been the peace concluded between the Romans and Sabines, by the mediation of the women. The women granted to their servants on this occasion the same privileges which were granted to the slaves by their masters in the Saturnalia.

No men living in celibacy were allowed to assist at the feast.

MATROSSES, soldiers, in the train of artillery, next below the gunners, and properly apprentices or assistants to

them: their duty is to assist the gunner in traversing, spunging, loading, and firing of guns, &c. They carry fire-locks, and march along with the guns and store-waggons, both as a guard, and to help in case of emergency.

MATRUNGA, in *Geography*, a town of Hindoostan; 37 miles N.E. of Ruttunpour.

MATSCHACH, a town of the duchy of Carinthia; 10 miles S. of Luxemburg.

MATSCHEN, a town of Saxony, in the circle of Leipsic; 6 miles N. of Leissnich.

MATSCHEVIZ, a town of the duchy of Warsaw, memorable for a battle fought in 1794, between the confederate Poles, under Kosciusko, and the Russians, under general Ferfan, in which the latter were victorious; 600 Poles fell, and 16,000 were made prisoners. All the artillery fell into the hands of the Russians, and only 1500 men escaped. Kosciusko, who was taken prisoner, was severely wounded, and very nearly lost his life: 32 miles E. of Warsaw.

MATSIMA, or SCHILPADS, an island of Japan, E. of Niphon. N. lat. 38 12'.

MATSINGLO, a town on the W. coast of the island of Luçon. N. lat. 15 38'. E. long. 120° 12'.

MATSUAH. See MASOWAH.

MATSUNAY, a sea-port of the island of Jedso, tributary to Japan. N. lat. 40 40'. E. long. 138 44'.

MATSYAVATAR, in *Hindoo Mythology*, is the first of the ten chief incarnations of the god Vishnu. This *avatara* was in the form of a fish, which is the meaning of the words, and it has been proved to have immediate reference to the deluge, and to be the same history, disguised in oriental fiction, of that event, as related in our scriptures. Sir W. Jones (*Asiatic Researches*, vol. i.) assents to the opinion of Borchart, that the fable of Saturn was raised on the true history of Noah; he shews that the seventh Menu of the Hindoos, named Satyavrata, in whose days this *avatara* is related to have taken place, corresponds in station and character with our patriarch. (See MENU and SATYAVRATA.) In his reign the Hindoos believe the whole earth to have been destroyed by a flood, including all mankind, who had become corrupt, except the pious prince himself, the seven Rishis, and their several wives, who, by command of Vishnu, entered a spacious vessel, accompanied by pairs of all animals. (See RISHI.) Vishnu, assuming the form of a fish, commanded the ark to be fastened by a cable, formed of a vast serpent, to his stupendous horn; secured thereby till the flood subsided; when he and Brahma slew a monster named Hyagriva, or the horse-necked, who, while Brahma was reposing at the end of a kalpa (see KALPA), stole the Vedas, and mankind had consequently fallen into the depths of ignorance and impiety. The Vedas having been recovered, (see VEDA,) the world was progressively re-peopled with pious inhabitants, descendants of the devout Satyavrata and his favoured companions. As Nuh, the true name of our patriarch Noah, may be easily deduced from Menu, so Adam may from *adim*, meaning, in the Sanskrita language, *first*; tending, as is evidently Sir W. Jones's opinion, to the conclusion that the first and last of the seven Menus can be no other than the great progenitor and restorer of our species. The history of the *avatara* under discussion is the subject of the first Purana, or sacred poem, consisting of 14,000 stanzas, (see PURANA,) and is concisely told in the eighth-book of the Sri Bhagavata, or life of Krishna. See those articles, also KURMAVATARA, for a brief account of the second incarnation of Vishnu.

MATSYS, QUINTIN, in *Biography*, known by the name of the blacksmith of Antwerp, because he followed that employment till he was 20 years old, when he became a painter.

painter, and arrived at great perfection in the dry style of the time in which he lived.

He was born in 1460, and is said to have been excited by love to exchange his heavy iron labours for the softer and more engaging charms of the pencil. Whatever were his motives, it was fortunate that he did devote his mind to that pursuit, as he possessed uncommon talents, and exerted them with great industry. His exertions were confined to subjects of common and vulgar life, to which he gave considerable interest, by his attention to expression, and his skill in rendering it. The best instance we have in this country is his excellent picture of the two misers in Windfor castle, of which there is a duplicate by him in possession of lord Lyttelton at Hagley in Worcestershire. He died in 1529, aged 69.

MATT. The produce of the first fusion of a sulphuretted ore is called a *mat*, a term probably adopted from the German miners; for the word in that language signifies dull, without lustre, a character that is applicable with great justice to most of the half sulphurized regu i when compared to the same metals in their pure state.

MATTA DE BRAZIL, in *Geography*, a populous town of Brazil, in the government of Pernambuco; 25 miles W. of Olinda: from its vicinity great quantities of Brazil wood are sent into Europe.

MATTADEQUN CREEK, a river of Virginia, which runs into York river, N. lat. 37° 40'. W. long. 77° 20'.

MATTADORE. See OMBRE.

MATTAGESS, in *Ornithology*, the English name of the largest species of the *lanius*, or butcher-bird.

The word *matagess* is borrowed from the Savoyards, and signifies the murdering pye; and has been given it from its savage disposition, and its resemblance to the magpye in the shape of its tail. See LANIUS *Excubitor*.

MATTAPONY, in *Geography*, a river of Virginia, navigable 70 miles above its mouth; it rises in Spotsylvania county, and pursuing a S.E. course, joins Pamunky below the town of Delawar, and forms with it York river.

MATTARELLA, a town of Italy, in the duchy of Spoleto; eight miles N.E. of Terni.

MATTATHIAS, in *Biography*, a Jewish priest, founder of the family of Maccabees, was descended from one of the twenty-four appointed by David to officiate in the temple, and was of the branch of the Asmoneans. The persecution of his countrymen, and profanation of their religion by Antiochus Epiphanes, were so grievous to him, that he retired from Jerusalem to his native place, to avoid the sight. One of the king's officers, named Apelles, coming thither to enforce his master's commands, assembled the people, with Mattathias and his five sons, and endeavoured to persuade them to compliance, but the zealous and patriotic priest loudly declared, that although the whole nation abandoned the religion of their fathers, he and his house would continue faithful to their God. His zeal carried him much farther than a mere assertion of his pious constancy; he put in practice an injunction of the Mosaic law, by actually killing on the spot a Jew who presented himself to sacrifice at the altar of an idol. At the same instant, he fell upon, and slew the king's officer, and his attendants, overthrew the idol, and ran through the city, calling upon all who were attached to their law to follow them. They quickly found themselves at the head of a considerable body of men; and having consulted together as to the lawfulness of fighting on the sabbath-day, it was agreed not only to be lawful but obligatory to resist an attack from their enemies, and the enemies of their religion on the sabbath. They instantly became aggressors, and marched from city to city; overthrew the altars

of idolatry, and restored the worship of the true God, Mattathias caused all the prisoners taken from the apostates to be put to death without mercy or compunction. Thus successfully did he commence that revolt which was productive of so many great events under his sons Simon, Judas, and Jonathan, and perceiving his own end approaching, he gave a most solemn exhortation to his sons to live in unity, and pursue with zeal and courage the course they had entered upon. He died in 166 B.C., leaving behind him the character of a valiant and faithful assertor of the religion and liberties of his country. Univer. Hist. Prideaux. vol. ii.

MATTEI, SAVERIO, a Neapolitan lyric poet, and musical critic; long in correspondence with Metastasio, an eminent Hebraist, and translator of the psalms into Italian verse; calculated for the reception of music in every form of cantata, duet, trio, and chorus. He was in close friendship with Jomelli, whose famous *Miserere*, for two voices, was composed to his version. He manifested his great regard for the admirable musician Jomelli, by assisting Ginnaro Manna in the arrangement and execution of a plan for his public funeral, in 1774; furnishing an example to posterity of the gratitude due to great talents, and a stimulus to young artists to merit equal honours. The learned Mattei has given an account of this public funeral, and of the works of the great musician, in his "Saggio di Poesie Latine ed Italiane," published at Naples, immediately after the melancholy event.

MATTEIS, NICOLA, a Neapolitan performer on the violin, who arrived in England in the latter end of Charles II.'s reign, and was one of the first great players upon that instrument, who settled in London.

A general passion for the violin, and for pieces expressly composed for it, as well as a taste for Italian music, seem to have been excited in our country about this time, when French music and French politics became equally odious to a great part of the nation.

In MS. memoirs of music, by the Hon. Roger North, brother of the lord Keeper North, to which we have had access, there is a curious and characteristic account of this musician; in which we are told "that the decay of French music, to which Charles was so partial, in favour of the Italian, came on by degrees. Its beginning was accidental, and occasioned by the arrival of Nicola Matteis. He was an excellent musician, and performed wonderfully on the violin. His manner was singular; but he excelled, in one respect, all that had been heard in England before: his *arciata*, or manner of bowing, his shakes, divisions, and, indeed, his whole style of performance, were surprising, and every stroke of his bow was a mouthful.

"All that he played was of his own composition, which manifested him to be a very exquisite harmonist, and of a boundless fancy and invention. And by all that I have been able to observe of his abilities, or to hear concerning those of other performers on the violin, none but Corelli seems to have surpassed him.

"When he first came hither he was very poor, but not so poor as proud; which prevented his being heard, or making useful acquaintance for a long time, except among a few merchants in the city, who patronized him. And setting a high value on his condescension, he made them indemnify him for the want of more general favour.

"By degrees, however, he was more noticed, and was introduced to perform at court. But his demeanor did not please, and he was thought capricious and troublesome; as he took offence if any one whistpered while he played, which was a kind of attention that had not been much in fashion at our court. It was said that the duke of Richmond would

have

have settled a pension upon him, though he wished him to change his manner of playing, and would needs have one of his pages shew him a better. Matteis, for the sake of the jest, condescended to take lessons of the page, but learned so fast, that he soon out-ran him in his own way. But he continued so outrageous in his demands, particularly for his solos, that few would comply with them, and he remained in narrow circumstances and obscurity a long while.

“Nor would his superior talents ever have contributed to better his fortune, had it not been for the zeal and friendly offices of two or three dilettanti, his admirers. These were Dr. Walgrave, a prodigy on the arch-lute; sir Roger L'Es-trange, an expert violist; and Mr. Bridgman, the under-secretary, who accompanied well on the harpsichord. These becoming acquainted with him, and courting him in his own way, had an opportunity of describing to him the temper of the English, who, if humoured, would be liberal; but if uncivilly treated, would be sulky and despise him and his talents. Assuring him that by a little complaisance he would neither want employment nor money.

“By advice so reasonable, they at length brought him into such good temper, that he became generally esteemed and sought after; and having many scholars, though on moderate terms, his purse filled apace, which confirmed his conversion.

“After this, he discovered a way of acquiring money, which was then perfectly new in this country. For observing how much his scholars admired the lessons he composed for them, which were all duos, and that most musical gentlemen who heard them, wished to have copies of them, he was at the expence of having them neatly engraved on copper-plates, in oblong octavo, which was the beginning of engraving music in England; and these he presented, well bound, to lovers of the art and admirers of his talents, for which he often received three, four, and five guineas. And so great were his encouragement and profits in this species of traffic, that he printed four several books of ‘Ayres for the Violin,’ in the same form and size.”

He printed lessons likewise for the guitar, of which instrument he was a consummate master, and had so much force upon it, as to be able to contend with the harpsichord, in concert.

Another book of his writing was designed to teach composition, ayre, and thorough base. Of this work, though it was printed, but few copies are subsisting. His full pieces, concertos, and solos, were never published, and are very scarce, if at all to be found.

The two first of the four books mentioned above, of which many copies were dispersed, consist of preludes, allemands, farabands, courants, giges, divisions on grounds, and double compositions fitted to all hands and capacities. The third book has for title, Ayres for the Violin, to wit: preludes, fugues, allemands, farabands, courants, giges, fancies, divisions, and likewise other passages, introductions, and fugues, for single and double stops; with divisions somewhat more artificial for the improvement of the hand, upon the base-viol or harpsichord. The fourth book is entitled, Other Ayres and Pieces, for the violin, base-viol, and harpsichord, somewhat more difficult and artificial than the former; composed for the practice and service of greater masters upon those instruments.

Mr. North observes, that while the lovers of music were becoming acquainted with his manner of playing from his own books, which often happened in large assemblies, no one pretended to do the like; for none could command that fullness, grace, and truth, of which he was master. So that, in his own time, his compositions were thought impracticable

from their difficulty; and since, as they were never thrown into the shops, they have been but little known. So that at present, now the instrument is so much advanced, no one can have the least idea of these pieces having ever been difficult, who was not a witness of his own manner of playing them. Indeed, his books, well studied, are a sufficient rudiment of artful composition.

Another observation of this speculative dilettante is, that “in a numerous assembly, when Matteis alone was to entertain the company, having his friends Walgrave, L'Es-trange, and Bridgman about him, and flaming with good humour and enthusiasm, he has seized on the attention of the whole audience with such force and variety, as to prevent even a whisper for more than an hour together, however crowded the room.”

After this, it is easy to imagine that his reputation and abilities would enable him to accumulate wealth, or to live in splendour: he chose the latter, took a great house, and indulging appetite, lived so luxuriously, that he brought on diseases which soon put an end to his existence.

He left a son, Nicola Matteis, whom he taught on the violin from his cradle. “I have seen the boy in coats,” says Mr. North, “play to his father's guitar. When he grew up he became a celebrated master on the violin, in London, for several years. Being invited into Germany, he went to Vienna, and has continued there ever since, in full payment for all the masters we have received from those countries.”

The younger Matteis must have returned to England soon after Mr. North's Memoirs of Music were written; as we remember to have seen him at Shrewsbury, where he was settled as a language-master as well as performer on the violin in 1737. We afterwards learned French and the violin of this master, who continued at Shrewsbury till his decease, about the year 1749. He played the solos of Corelli with more simplicity and elegance than any performer we ever heard.

According to Walther, his name appeared in the Vienna calendar, as one of the emperor's band of violins in 1721 and 1727. In Roger's Catal. of Music, five different works appear under the title of “Arie cantabile à Violino solo Violoncello e basso continuo.” This seems to have been the younger Matteis, of whom the Hon. Mr. North speaks.

MATTELOY, in *Geography*, a town of Hindoostan, in Canara; two miles from Nelisuram.

MATTER, a town of Tunis, anciently called “Oppidum Matterense;” 27 miles N.W. of Tunis.

MATTER, *materia, body*, or an extended, solid, divisible, moveable, and passive substance, the first principle of all natural things, from the various arrangements, and combinations whereof all bodies are formed.

Aristotle makes three principles, matter, form, and privation: which last the Cartesians throw out of the number, and others the two last.

The properties of matter we are pretty well acquainted with, and can reason about its divisibility, solidity, &c. but the subject in which these properties reside, or their substratum, is still a mystery. Aristotle speaks very darkly on the subject, defining matter to be *nec quid, nec quantum, nec quale*, nor any certain determinate thing at all; which many of his followers interpret so as to believe, that matter does not at all exist. The Cartesians make the essence of matter to consist in extension; arguing, that since the properties above-mentioned are all that are essential to matter, some of them must constitute its essence; and, since extension is conceived prior to all the rest, and is that without which none of the rest can be conceived, extension is that which con-

stitutes the essence of matter. But the conclusion here is unjust; for, on his principle, the existence of matter, according to Dr. Clarke, would have the fairest title to constitute its essence, the *existere* being conceived prior to all properties, and even to extension. Since, then, the word extension appears to go farther, and to be more general, than matter, that impenetrable solidity, which is essential to all matter, and to matter alone, and from which all its properties manifestly flow, may, with more propriety, be called the *essence* of matter.

Again, if extension were the essence of matter, and so matter and space the same thing, it would follow, that matter is infinite and eternal, that it is a necessary being, and could neither be created nor annihilated; which is absurd. Besides, it appears, both from the nature of gravity, the motions of comets, the vibrations of pendulums, &c. that space is not matter; and therefore it is not extension, but solid, impenetrable extension, which has a power of resisting, that constitutes matter.

Many among the old philosophers maintained the eternity of matter; out of which they supposed all things to be formed by the hands of nature; as being unable to conceive how any thing should be formed out of nothing. Plato maintained, that matter had existed eternally, and concurred with God in the production of all things, as a passive principle, or a kind of collateral cause.

Matter and form, the two simple and original principles of all things, according to the ancients, composed some simple natures, which they called *elements*; out of the various combinations whereof all natural things were afterwards composed.

Dr. Woodward seems of an opinion not very unlike this, *viz.* that matter is originally and really very different, being at its first creation divided into several ranks, sets, or kinds, of corpuscles, differing in substance, gravity, hardness, flexibility, figure, size, &c. from the various compositions and combinations of which, he thinks, arise all the varieties in bodies, as to colour, hardness, gravity, tastes, &c. But sir Isaac Newton takes all those differences to result from the various arrangements of the same matter; which he judges to be homogeneal and uniform in all bodies.

Besides the properties of matter formerly known, sir Isaac Newton has discovered a new one; *viz.* "That of attraction, or that every particle of matter has an attractive power, or a tendency towards every other particle: which power is strongest in the point of contact, and suddenly decreases, in so much that it acts no more at the least sensible distance; and, at a greater distance, is converted into a repellent force, whereby the parts fly from each other." On this principle of attraction, he accounts for the cohesion of the particles of bodies, which is otherwise inexplicable.

For he takes occasion to observe, "That all bodies seem to be compounded of hard particles, even light itself, and all other the most volatile of fluids; in so much that hardness may be esteemed a property of all un-compounded matter; at least, the hardness of matter stands on as good a footing as that of its impenetrability; all the bodies we know of being either hard themselves, or capable of being hardened. Now, if compound bodies be so hard, as we find some of them, and yet if they are very porous, and consist of parts which are only laid together, the simple particles, which are void of pores, and were never yet divided, must be much harder. Now, such hard particles being heaped together, can scarce touch one another in more than a few points; and therefore they must be separable with much less force than is requisite to break a solid particle, whose parts touch in all the space, without any pores or interstices to weaken their cohesion.

How then should such very hard particles, only laid together, and touching only in a few points, stick together, and that so firmly as they do, without the assistance of something that causes them to be attracted or pressed towards each other?"

The same great author observes farther, "That the smallest particles may cohere by the strongest attractions, and compose bigger particles of weaker virtue; and many of these may cohere, and compose still bigger particles, whose virtue is still weaker, and so on for divers successions, until the progression end in the biggest particles; on which the operations in chemistry, and the colours of natural bodies depend, and which, by cohering, compose bodies of a sensible magnitude. If the body is compact, and bends or yields inward to pressure, without any sliding of its parts, it is *hard* and *elastic*, returning to its figure with a force arising from the mutual attraction of its parts. If the parts slide from one another, the body is *malleable* or *soft*. If they slip easily, and are of a fit size to be agitated by heat, and the natural heat is great enough to keep them in agitation, the body is *fluid*; and, if it be apt to stick to things, it is *humid*. And the drops of every fluid affect a round figure by the mutual attraction of their parts, as the globe of the earth and sea affects a round figure, by the mutual attraction of the gravity of its parts."

Again, "Since metals, dissolved in acids, attract but a small quantity of the acid, their attractive force reaches but to a small distance. Now, as in algebra, where affirmative quantities cease, there negative ones begin; so in mechanics, where attraction ceases, there a repulsive virtue must succeed. That there really is such a virtue, seems to follow from the reflections and inflections of the rays of light; the rays being repelled by bodies in both these cases, without the immediate contact of the reflecting or inflecting body. The same thing seems also to follow from the emission of light; a ray, as soon as shaken off from a shining body by the vibrating motion of the parts of the body, and got beyond the reach of attraction, being driven away with exceeding great velocity: for that force, which is sufficient to turn it back in reflection, may be sufficient to emit it. It seems also to follow, from the production of air and vapour; the particles, when they are shaken off from the body by heat or fermentation, so soon as they are beyond the reach of the attraction of the body, receding from it, and also from one another, with great strength, and keeping at a distance, so as sometimes to take up above a million of times more space than they did before in the form of a dense body; which vast contraction and expansion seems unintelligible, by feigning the particles of air to be springy and ramous, or rolled up like hoops, or by any other means than a repulsive power. The particles of fluids, which do not cohere too strongly, and are of such a smallness, as renders them most susceptible of those agitations which keep liquors in a fluor, are more easily separated and rarefied into vapour, *i. e.* in the language of the chemists, they are *volatile*; rarefying with an easy heat, and condensing again with cold. But those which are grosser, and so are less susceptible of agitation, or which cohere by a stronger attraction, are not separated without a stronger heat, or perhaps not without fermentation. And these last are the bodies which chemists called *fixed*; and yet these, being rarefied by fermentation, become true permanent air; those particles receding with the greatest force, and being most difficultly brought together, which, upon contact, cohere the most strongly. And because the particles of permanent air are grosser, and arise from denser substances than those of vapours; thence it is, that true air is more ponderous

ponderous than vapour; and that a moist atmosphere is lighter than a dry one, quantity for quantity. From the same repelling power it seems to be, that flies walk upon the water without wetting their feet; and that the object-glasses of long telescopes lie upon one another without touching; and that dry powders are difficultly made to touch one another so as to stick together, unless by melting them, or wetting them with water, which, by exhaling, may bring them together; and that two polished marbles, which by immediate contact stick together, are yet difficultly brought so close together as to stick."

He farther observes, "That, all things considered, it seems probable, God, in the beginning, formed matter in solid, massy, hard, impenetrable, moveable particles, of such sizes, figures, and with such other properties, and in such proportion to space, as most conduced to the end for which he formed them; and that these primitive particles, being solid, are incomparably harder than any porous bodies compounded of them; even so very hard as never to wear, and break in pieces: no ordinary power being able to divide what God himself made one in the first creation. While the particles continue entire, they may compose bodies of one and the same nature and texture in all ages; but, should they wear away, or break in pieces, the nature of things depending on them would be changed. Water and earth, composed of old worn particles, and fragments of particles, would not be of the same nature and texture now with water and earth composed of entire particles in the beginning. And, therefore, that nature may be lasting, the changes of corporeal things are to be placed only in the various separations and new associations and motions, of these permanent particles; compound bodies being apt to break not in the midst of solid particles, but where those particles are laid together, and touch in a few points."

It seems farther, "That these particles have not only a *vis inertiae*, accompanied with such passive laws of motion as naturally result from that force, but also that they are moved by certain active principles, such as is that of gravity, and that which causeth fermentation, and the cohesion of bodies. These principles are to be considered not as occult qualities, supposed to result from the specific forms of things, but as general laws of nature, by which the things themselves are formed; their truth appearing to us by phenomena, though their causes are not yet discovered."

Hobbes, Spinoza, &c. maintain all the beings in the universe to be material, and their differences to arise from their different modifications, motions, &c. Thus matter, extremely subtle, and in a brisk motion, they conceive, may think; and so they exclude all spirits out of the world. See HOBBIsm and SPINOZISM.

Dr. Berkeley, on the contrary, argues against the existence of matter itself; and endeavours to prove, that it is a mere *ens rationis*, and has no existence out of the mind. See ABSTRACTION, BODY, and EXISTENCE.

Some late philosophers have advanced a new hypothesis concerning the nature and essential properties of matter. The first person who suggested, or at least published an account of this hypothesis, was M. Boscovich, in his "Theoria Philosophiæ Naturalis," printed at Vienna in the year 1758. He supposes that the whole mass of matter constituting the various bodies of the universe, consists of a very large, but finite number of simple, indivisible, unextended atoms. These atoms, which may be considered as physical points, are endued with repulsive and attractive powers, which operate variously at different distances. In other words, they are surrounded with various spheres of repulsion and retraction, in the same manner as *solid matter* is generally supposed to

be. At the least and innermost distances they repel one another, and by diminishing the distances, these repulsive powers are augmented beyond all limits, so as to be sufficient for annihilating the greatest velocity, and for preventing the actual contact of the primary atoms of matter. At sensible distances the force, which was repulsive, becomes attractive, and decreases, sensibly, as the squares of the distances increase, so as to constitute universal gravity, and to extend beyond the sphere of the most distant limits. But between the supposed innermost repulsive force and the outermost attractive force, at insensible distances, many changes or varieties of force, and consequent determination to motion, occur; the repulsive force being diminished as the distance is augmented. The repulsive force becomes wholly extinct at a certain distance: but on increasing this distance, attraction begins, increases, becomes less, and vanishes; and when the distance is still greater, the force becomes repulsive, increases, lessens, and vanishes as before. Changes of the kind now mentioned occur at insensible distances, sometimes more rapidly, sometimes more slowly; and sometimes one kind of force may become extinct and recover its appropriate state without passing to the other kind. For all these variations the different distances, though insensible to us, afford sufficient scope, as the least part of space is divisible *in infinitum*. Our author's assumed atoms possess, besides these repulsive and attractive forces, that *vis inertiae* which is admitted to belong to matter by almost all modern philosophers. Our author has illustrated his theory of repulsive and attractive forces by a geometrical curve, varying with a change of distances, which, at first view, appears to be a complicated irregular line; but which Boscovich shews to be regular and uniform, and capable of being expressed by an uniform algebraical equation. But for this part of the subject, the detail of which, so as to render it intelligible, would far exceed our prescribed limits, we must refer to his own work. Nor can we explain at large that law of continuity, by which variable quantities, passing from one magnitude to another, pass through all the intermediate magnitudes, without ever abruptly passing over any of them, and which our author first proves from induction, and then applies to the illustration and establishment of his system. From this law our author infers the impossibility of contact between bodies, and by means of it he explains the interior repulsive forces of his system. Again, from these repulsive forces he deduces the inextension of his atoms; for as this repulsion is common to all matter, it must cause a perfect simplicity in the first elements of body. If these elements were extended, and consequently compounded of particles of an inferior order, these particles might possibly be separated, and then they might meet, and thus an abrupt passage from one velocity to another might take place, which is inconsistent with the law of continuity, previously established. Besides, our author, by rejecting the extension of the first elements of matter, and reducing them, as we have before observed, to mere physical points of attraction and repulsion, precludes all the difficulties that result from continual extension in body, and which have never been satisfactorily obviated. If the elements of matter are extended, each of them may be divided *in infinitum*, and each part may still be divided *in infinitum*. Can this division, it may be questioned, be actually made by the power of God or not? Can there be one *infinite* in number greater than another? Can there be a *compound* without a *simple* of the same kind? These difficulties, it is alleged, do not regard space, which is no real being; but they would regard matter, if it had continued extension. All these perplexities are said to be removed by

M A T T E R.

maintaining, with Boscovich, that the first elements of bodies are perfectly simple, and therefore inextended. But if a particle of matter is not extended, in what respect does it differ from a point of space? M. Boscovich says, it is endued with attractive and repulsive forces. But what is it before it is thus endued? Does it then differ from a point of space? It is next to impossible to form any satisfactory notion of such difference. A point of space, considered as an individual, is distinguished from another individual merely by its situation; it is, therefore, immoveable, but matter is moveable. Have these forces, it is very properly asked, which make matter an object of sense, any substratum, any thing in which they are inherent as qualities? What are the things which these qualities distinguish from each other as individuals?

With regard to the exterior attractive forces of this system, there can be no question; because they constitute universal gravity, the effects of which are constantly perceptible. But between the interior repulsive and exterior attractive forces, we must admit many transitions from repulsion to attraction, and *vice versa*, at insensible distances, which are indicated to us by cohesion, fermentation, evaporation, and other phenomena of nature. Against this system, however ingeniously devised and ably supported by the celebrated author, many objections have been urged. That there should be no contact between bodies, is an assumption which will not be readily admitted by those who have long entertained different ideas on the subject; and yet Boscovich himself allows, that bodies approach so near to one another as to leave no sensible distance between them, and our senses, it must be acknowledged, are impressed in the same manner by his repulsive forces as they would have been by solid bodies themselves. It has been said that M. Boscovich, by denying the extension of atoms, annihilates matter; and to this objection we have met with no satisfactory answer. It has been also said, that upon this part of his system, there would be no difference between body and spirit. By others it has been alleged, that M. Boscovich's repulsive and attractive forces are like the occult qualities of the Peripatetics; but a similar objection has been urged against Newton's attraction; and it is equally groundless, because powers of this kind are sufficiently ascertained by their effects. Some have been indisposed to admit motion and collision without immediate impulse; and it must be confessed, that they are not easily explained and clearly understood upon his system. For our author's mode of explaining them, and of applying his system to mechanics, &c. we must refer to the second part of the work already cited. His next object, in the third part, is to account on his system for the general properties of matter. Upon his theory matter is not impenetrable. Provided that any body move with a sufficient degree of velocity, or have sufficient momentum to overcome any power of repulsion that it may meet with, it will find no difficulty in making its way through any body whatever; for nothing will interfere, or penetrate another, but powers, such as we know do in fact exist in the same place, and counterbalance and over-rule one another; a circumstance which never had the appearance of a contradiction, or even of a difficulty. If the momentum of such a body in motion be sufficiently great, M. Boscovich demonstrates, that the particles of any body through which it passes, will not even be moved out of their place by it. With a degree of velocity something less than this, they will be considerably agitated, and ignition might, perhaps, be the consequence; though the progress of the body in motion would not be sensibly interrupted; and with a still less momentum it might not pass at all. This theory M. Boscovich has taken great

pains to illustrate and confirm; shewing, that it is by no means inconsistent with any thing that we know concerning the laws of mechanics, or our discoveries in natural philosophy; and that a great variety of phenomena, particularly those which relate to light, admit of a much easier solution upon this hypothesis than upon any other. The most obvious difficulty, says Dr. Priestley, and, indeed, the only one that attends this hypothesis, as it supposes the mutual penetrability of matter, arises from the difficulty we meet with in attempting to force two bodies into the same place. But it is demonstrable, that the first obstruction arises from no actual contact of matter, but from mere powers of repulsion. This difficulty we can overcome; and having got within one sphere of repulsion, we fancy that we are now impeded by the solid matter itself. But the very same is the apprehension of the generality of mankind with respect to the first obstruction. Why, therefore, says he, may not the next resistance be only another sphere of repulsion, which may only require a greater force than we can apply to overcome it, without disordering the arrangement of the constituent particles; but which may be overcome by a body moving with the amazing velocity of light?

This scheme of the mutual penetration of matter first occurred to Mr. Michell, independently of any communication with M. Boscovich, on reading Baxter on the "Immateriality of the Soul." He found that this author's idea of matter was, that it consisted, as it were, of bricks cemented together by an immaterial mortar. These bricks, if he would be consistent in his reasoning, were again composed of less bricks, cemented likewise by an immaterial mortar, and so on *ad infinitum*. This putting Mr. Michell upon the consideration of the appearances of nature, he began to perceive that the bricks were so covered with this immaterial mortar, that, if they had any existence at all, it could not possibly be perceived; every effect being produced at least in nine instances in ten certainly, and probably in the tenth also, by this immaterial, spiritual, and penetrable matter. Mr. Michell, finding it necessary, in order to solve the appearances of nature, to admit of extended and penetrable immaterial substance, if he maintained the impenetrability of matter; and observing farther, that all we perceive by contact, &c. is this penetrable immaterial substance, and not the impenetrable one, began to think, that he might as well admit of penetrable material, as penetrable immaterial substance; especially as we know nothing more of the nature of substance than that it is something which supports properties; which properties may be whatever we please, provided they be not inconsistent with each other, that is, do not imply the absence of each other. This by no means seemed to be the case, in supposing two substances to be in the same place at the same time, without excluding each other; the objection to which is only derived from the resistance we meet with to the touch, and is a prejudice that has taken its rise from that circumstance. Dr. Priestley observes, that if he were to make any alteration in this hypothesis, it would be to suppose the force of the sphere of repulsion next to any of the indivisible points, which constitute what we call solid bodies, not to be absolutely infinite, but such as may be overcome by the momentum of light. If, however, we consider that Mr. Boscovich makes this nearest power of repulsion not to extend to any real space, but to be confined to the indivisible point itself, it may appear to be sufficient for the purpose.

The theory of M. Boscovich is easily applicable to the cohesion of atoms, of more compounded particles, and of sensible bodies. From the cohesion of particles he deduces the extension of bodies; because there must always be space between

between the particles. Extension, however, according to his system, does not suppose the continuity of matter; though we cannot perceive the small interval that subsists between the constituent parts of some bodies, and much less the distance between the simple elements that compose them. Figurability results from extension; and density from the very different quantities of matter that may be contained under the same figure and bulk; that body being the most dense, which contains in the same space the greatest number of atoms, and *vice versa*. But if these atoms are mere unextended points, it is not easy to conceive how any aggregate or combination of them can constitute a body of any supposed density. However, our author supposes that density may be augmented by the nearer approach of the atoms to one another; and of course a body of any given magnitude may be divisible beyond any assigned limits. An essential part of mobility in this system consists in forces, which, at certain distances, are determinations to motion. Universal gravity, which takes place in sensible distances, is perfectly intelligible in this system; though our author seems to suppose that, when it has extended to the sphere of the limits most distant from the sun, it may pass to repulsion, and again revert to attraction, and form limits of cohesion at the time the sun may be within such a limit with regard to the fixed stars, and our planetary system form only a small part of the whole universe.

But we are now advanced to the regions of mere conjecture and hypothesis. Our author has further extended his theory to the properties pertaining to distinct classes of bodies, such as fluidity, solidity, softness and hardness, flexibility, elasticity, viscosity; to the operations of chemistry; and to the explication of the phenomena of light, electricity and magnetism, and animal sensation. Of his ample and various observations on these subjects, we can only select a few particulars. The parts of fluids are easily separated, and moved among one another, because they are spherical and very homogeneous, so that their forces are directed more to their centre than to one another, and, of course, less obstructed in their motions. Some particles are mutually attracted in a very small degree, and others more sensibly, such as those of water and mercury. The particles of air are separated by a strong force of repulsion, which accounts for the great rarefaction of this fluid. Solid bodies are formed of substances of such figures, which occasion a greater cohesion than those of fluids, so that they are prevented from moving separately or round one another: of these some are harder, as their constituent particles are placed in limits which have strong repulsive arches within them, and others, whose particles have their arches of repulsion weaker, are softer. Some are flexible, because their particles are placed in limits that have weak arches of repulsion and attraction on each side: and if these arches are short, the particles gain more limits of cohesion, and remain bent; but if the arches are longer, the former repulsion and attraction will continue to act and restore the body to its former position; and in doing this with an accelerated velocity, the parts will pass their former limits, and vibrate backwards and forwards, as is the case in a bended spring: and thus our author accounts for elasticity. Viscous bodies, having less cohesion than solid, and more than fluids, adhere to others in consequence of an attraction which their particles acquire from their composition. Thus water itself adheres to some bodies, and is repelled by others; which variety is ascribed to the various respective forces derived from the different composition of their constituent particles. In explaining the composition of organic bo-

dies, the author considers that particles may be so formed as to repel some and attract others, and thus accounts for vegetation, nutrition, and secretion: and as one particle may attract another in one part only, and repel it in every other situation, we may hence infer the orderly situation of the particles in many crystallizations. The process of various chemical operations and their effects are also explained by Boscovich, agreeably to his general system. Light he considers as an effluvia, emitted with great velocity from luminous bodies by a strong repulsion: and he attributes the phenomena of electricity and magnetism to various attractions and repulsions. Fire he supposes to differ from the electrical fluid merely in this circumstance, that fire is an actual fermentation, which is not the case with the electrical fluid. In explaining our bodily sensations, he ascribes what other philosophers attribute to the immediate contact of bodies to attractions and repulsions, which are adapted to cause that motion in our nerves, that is supposed to take place in the organs of sensation, and to be thence communicated to the brain.

We are happy to be able to close this concise and imperfect account of Boscovich's system with announcing to the philosophers, who may admit or reject it, that he was fully convinced of the necessity of admitting a self-existent, all-powerful, and intelligent Being, to whom he ascribes the creation of those materials that compose the universe, and the arrangements of them in their present beautiful form. Indeed, he expresses his astonishment, that any person who pretends to the name of a philosopher should resist the evidence which the least parts of the visible universe afforded in proof of the existence of God, as the first cause of all. Chance, to which some have absurdly attributed the origin of the universe, he very justly considers as a word without a meaning; nor can he allow that the world has existed of itself in any form like its present from all eternity: God alone being eternal and actually infinite. He is also a strenuous advocate, not only for the principles and duties of natural religion, but for the excellence and benefits of that revelation which God has been pleased, in great goodness, to communicate to mankind.

In conformity to the hypothesis of Boscovich and Michell, Dr. Priestley maintains, that matter is not that inert substance that it has been supposed to be; that powers of attraction or repulsion are necessary to its very being, and that no part of it appears to be impenetrable to other parts. Accordingly, he defines matter to be a substance, possessed of the property of extension, and of powers of attraction or repulsion, which are not distinct from matter, and foreign to it, as it has been generally imagined, but absolutely essential to its very nature and being: so that when bodies are divested of these powers, they become nothing at all. However, though he supposes that these powers are essential to the being of matter, inasmuch that it cannot exist without them as a material substance at all, he by no means maintains that they are self-existent in it; but that from whatever source these powers are derived, or by whatever being they are communicated, matter cannot exist without them; and if that superior power or being withdraws its influence, the substance itself necessarily ceases to exist, or is annihilated. Whatever solidity any body has, it is possessed of only in consequence of being endued with certain powers, and together with this cause, solidity, being no more than an effect, must cease. Dr. Priestley, in another place, has given a somewhat different account of matter; according to which it is only a number of centres of attraction and repulsion; or more properly of centres, not divisible,

to which divine agency is directed: and as sensation and thought are not incompatible with these powers, solidity, or impenetrability, and consequently a *vis inertiae*, only, having been thought repugnant to them, he maintains, that we have no reason to suppose that there are in man two substances absolutely distinct from each other. Disquisitions on Matter and Spirit, 1777, passim. See SOUL.

Dr. Price, in a correspondence with Dr. Priestley, published under the title of a "Free Discussion of the Doctrines of Materialism and Philosophical Necessity," 1778, has suggested a variety of objections, in our opinion unanswerable, against this hypothesis of the penetrability of matter, and against the conclusions which are drawn from it. The *vis inertiae* of matter, he says, is the foundation of all that is demonstrated by natural philosophers concerning the laws of the collision of bodies. This, in particular, is the foundation of sir Isaac Newton's philosophy, and especially of his three laws of motion. Solid matter has the power of acting on other matter by impulse; but unsolid matter cannot act at all by impulse: and this is the only way in which it is capable of acting, by any action that is properly its own. If it be said, that one particle of matter can act upon another without contact and impulse, or that matter can, by its own proper agency, attract or repel other matter which is at a distance from it, then a maxim hitherto universally received must be false, that "nothing can act where it is not." Sir Isaac Newton, in his letters to Dr. Bentley, calls the notion, that matter possesses an innate power of attraction, or that it can act upon matter at a distance, and attract and repel by its own agency, an absurdity into which, he thought, no one could possibly fall. And in another place he expressly disclaims the notion of innate gravity, and has taken pains to shew that he did not take it to be an essential property of bodies. By the same kind of reasoning pursued, it must appear, that matter has not the power of attracting and repelling; that this power is the power of some foreign cause, acting upon matter according to stated laws; and that, consequently, attraction and repulsion; not being actions, much less inherent qualities of matter, as such, it ought not to be defined by them. And if matter has no other property, as Dr. Priestley asserts, than the power of attracting and repelling, it must be a non-entity; because this is a property that cannot belong to it. Besides, all power is the power of something; and yet if matter is nothing but this power, it must be the power of nothing; and the very idea of it is a contradiction. If matter is not solid extension, what can it be more than mere extension? Farther, matter that is not solid is the same with pore; it cannot, therefore, possess what natural philosophers mean by the momentum or force of bodies, which is always in proportion to the quantity of matter in bodies, void of pore. Momentum is the cause of resistance, and not *vice versa*. Moreover, within the sphere of repulsion, the attraction of cohesion takes place; and this is the power which, according to Dr. Priestley, unites the parts of matter, and gives it existence. But, since matter is penetrable, will not this attraction drive all the parts of it into one another, and cause them to coalesce into nothing? This effect must follow, unless there exists, beyond the sphere of attraction, and nearer to matter, a second sphere of repulsion, which again prevents contact. Thus it appears evident, that if a power of attracting acts, it must contract itself into nothing; and that if a power of repulsion acts, it must dissipate itself into nothing. For a farther account of the arguments *pro* and *con* on this subject, we must refer to the work already cited.

MATTER, *Aetherial*. See *ÆTHERIAL*.

MATTER, *Subtile*. See *MATERIA Subtilis*.

MATTER, *Quantity of*. See *QUANTITY*.

MATTER of *Deed* signifies a truth to be proved, though not by any record: by which it stands contradicting distinguished from

MATTER of *Record*, which is that which may be proved by some record.

If a man be sued to an exigent during the time he was in the king's wars, that is *matter in deed*, and not *matter of record*; and therefore he that will allege this for himself must come before the scire facias or execution be awarded against him; for, after that, nothing will serve but *matter of record*; that is, some error upon the process appearing upon record.

MATTER, *Foreign*. See *FOREIGN*.

MATTEUCCI, IL CAVALIERE, in *Biography*, a Neapolitan singer, possessed of a voice so extraordinary, and a manner of singing so perfect, that he was regarded at the head of his profession. After having been long in the service of the court of Spain, he returned to Naples, where he still lived in 1730. At fourscore years of age he had still a voice as firm, sweet, and flexible, as in his youth.

MATTHEIA, ST., in *Geography*, a small island in the North Pacific ocean, about 140 miles from the south-east coast of Russia. N. lat. 60° 20'. E. long. 177° 10'.

MATTHESON, JOHN, in *Biography*, a native of Hamburg, was born in 1681. He was the son of a Lutheran clergyman, and seems to have been educated with great care. Among his early studies, at seven years old he was allowed a music-master, under whom he profited so rapidly, that at the age of nine he was able to sing to the organ, in the church at Hamburg, anthems of his own composition.

But while he was so eagerly pursuing the study of music, he made himself master of modern languages, and applied part of his time to the study of the civil law, attending the public lectures by turns of two doctors learned in that faculty. But we shall chiefly confine ourselves to his progress in music, and the use he made of his attainments in that art; as his connection and conflict with Handel, early in their several lives, have rendered him an interesting personage to our readers of musical history.

At the age of eighteen he composed an opera in the German language, called the "Pleiades," and performed a principal part in it himself.

Handel, in 1703, at the age of nineteen, on the death of his father, in order to avoid being burthensome to his mother, went to Hamburg, and engaged himself in the opera band of that city, as a second ripieno violin. He and Mattheson soon became acquainted, by accidentally meeting each other in an organ-loft, where Handel was practising at the time that Mattheson went thither for the same purpose. After this they studied and visited churches together, in order to exercise themselves on the organ.

As these young students lived much together, in great intimacy, they had frequent trials of skill, and, in friendly emulation, had frequent contentions in musical knowledge and talents: in the latter, it appearing that they excelled on different instruments, Handel on the organ and Mattheson on the harpsichord, they mutually agreed not to invade each other's province, and faithfully observed this compact during five or six years.

Mattheson tells us, that no one except himself knew that Handel could play on any other instrument than the violin; "but his superior abilities were soon discovered, when, upon

MATTHESON.

upon occasion of the harpsichord-player at the opera being absent, he was persuaded to take his place; for he then shewed himself to be a great master, to the astonishment of every one except myself, who had frequently heard him before upon keyed-instruments."

About this time an opera, called "Cleopatra," composed by Mattheson, was performed on the Hamburg stage, in which he acted the part of Antony himself, and Handel played the harpsichord; but Mattheson being accustomed, at the death of Antony, which happens early in the piece, to take the harpsichord in the character of the composer, Handel refused to indulge his vanity by relinquishing to him that post, which occasioned so violent a quarrel between them, that, at going out of the theatre, Mattheson gave him a slap on the face; upon which, both immediately drew their swords, and a duel ensued in the market-place, before the door of the opera-house: luckily the sword of Mattheson was broken against a metal button upon Handel's coat, which put an end to the combat; and they were soon after reconciled.

This rencontre happened on the 5th of December 1704; and as a proof of their speedy reconciliation, Mattheson tells us that, on the 30th of the same month, he accompanied the young composer to the rehearsal of his first opera of "Almira," at the theatre, and performed in it the principal part; and that afterwards they became better friends than ever.

On the 25th of February, in the next year, Handel produced his second opera, called "Nero," which had likewise a very favourable reception. It was at the end of the run of these two dramas that Mattheson, who performed the principal man's part in both, quitted the stage, on being appointed secretary of legation to sir Cyril Wych, resident at Hamburg from the English court.

Mattheson, with all his failings, was certainly a man of quick parts, diligent cultivation, and talents of various kinds; but, as a musician, he had more knowledge than taste. Many stories were long in circulation at Hamburg, concerning his pedantry, vanity, and eccentricities. Long after he had ceased to play and compose, he continued to write musical treatises, of which the names are now hardly to be found. All the music we have seen by Mattheson is sterile of ideas and uninteresting. It has been said, that he was a great performer on the harpsichord, and that Handel often amused himself in playing his pieces; in doing which, if ever he regarded Mattheson as a formidable rival, his triumph must have been very complete in comparing them with his own, or with the inherent powers which he must have felt of producing better whenever he pleased. We are in possession of twelve Lessons by Mattheson, engraved on copper by Fletcher, in tall folio of 18-staved paper, London, 1714, who, in a preface, speaks of them as "pieces which claim precedence to all others of this nature, as being composed by one of the greatest masters of the age, in a style altogether pleasing and sublime."

They consist, like other sets of lessons of that period, of

overtures, preludes, fugues, allemandes, courants, giges, and aires; but notwithstanding the editor's eulogy, they resemble all the harpsichord music which we ever saw, anterior to Handel's admirable "Suites de Pieces," first set in 1720; though, in good harmony, they impress the mind with no better idea of accent, grace, or passion, than the jingling of triangles, or bells of a pack-horse; and, indeed, are such as degrade the instrument to the level of "sounding brass, and a tinkling cymbal."

There is a list of Mattheson's works in Walther's Musical Lexicon, as far as the year 1732, amounting to forty; but as he continued writing to the last, and lived till 1764, it is probable that he kept his promise of printing as many works on the subject of music as he had lived years, and still leaving to his executors as many more in manuscript for the use of posterity.

Mattheson bequeathed at his decease all his possessions to the republic of Hamburg, on condition that such an organ should be built for the great church as he described in his will. It had not been long finished when we saw and heard it, in 1772; but we believe it to be the largest and most complete in Europe. It cost upwards of 4000*l.* sterling, was built by Hildebrand, is of 32 feet, has four sets of keys, long compass, up to F in altissimo, and, with the pedals, goes down to double double C. The keys are covered with mother-of-pearl and tortoise-shell; the front is curiously inlaid, and the case richly ornamented. There are 64 stops in this organ; and a swell attempted, but with little effect; only three stops had been allowed to it, and the power of crescendo et diminuendo was so small, that if we had not been told there was a swell, we should not have discovered it.

Mattheson's picture is placed in the front of the organ gallery, and there is a Latin inscription under it recording the benefaction. This good man had more pedantry and nonsense about him than true genius. In one of his vocal compositions for the church, in which the word *rainbow* occurred, he gave himself infinite trouble to make the notes of his score form an arch. What pity this arch was not represented in the front of his instrument, where, upon the principle of Père Castel's Clavecin Oculaire, his arch might have had all the colours as well as the curvature of the rainbow! See PERE CASTEL, and CLAVECIN OCULAIRE.

The rainbow story may serve as a specimen of Mattheson's taste and judgment with respect to the propriety of musical expression and imitation.

By his last will and testament, an anthem was performed at his funeral, which he had himself composed for the occasion; but it excited more laughter than sorrow, when heard in its old-fashioned grace. Yet, in spite of ridicule, he was certainly possessed of a great share of musical erudition, and was of great use to his countrymen in his younger days, by bringing them acquainted with music of other parts of the world, and by introducing a better style among them than their own. He was less fond of fugues than his contemporaries; but in his latter days he became a mere theorist, without taste or feeling.
